- 17** Calyx-segments ciliate or fimbriate on the margins; young branches patent-pilose or hispid; leaves scabrid or glabrescent above, pilose beneath especially on the midrib and lateral nerves, rarely on the midrib only; leaves entire or coarsely sinuate-dentate, shortly cuneate to slightly cordate at base [13. capitatum var. capitatum](#)
- Calyx-segments quite glabrous, as well as the young branches and leaves; leaves always entire, shortly cuneate or rounded at base [13a. capitatum var. cephalanthum](#)
- 18** Branches, leaves and inflorescences whitish-tomentose when young; leaves rather small 1.5-7 cm. long, 0.7-4 cm. broad, broadly ovate to ovate-lanceolate, petiolate; flowers in lateral and terminal, peduncled, head-like clusters; calyx-lobes lanceolate; corolla-tube 1.5-2.5 cm. long [15. acerbianum](#)
- Branches yellowish-brown pubescent; leaves rather large, ovate, cordate or truncate at base, 10-18 cm. long and 7-12 cm. broad, short- or long-petiolate; flowers in solitary terminal subcapitate inflorescences; calyx-lobes deltoid; corolla-tube 3-5 cm. long [16. welwitschii](#)
- 19** Corolla-tube 6-12 cm. long; leaves opposite, broadly lanceolate, acuminate, gradually attenuate to base and scarcely petiolate, 6-14 cm. long, 1.5-5 cm. broad, coarsely dentate; stem erect, herbaceous [17. incisum](#)
- Corolla-tube up to 4 cm. long; leaves distinctly petiolate: **20**
- 20** Calyx-tube 3-5 times longer than the teeth; teeth usually glabrous; frequently cauliflorous: **21**
- Calyx-tube shorter to about as long as the teeth, if longer than the teeth then distinctly pilose: **22**
- 21** Inflorescence an elongate, leafless panicle, frequently cauliflorous; rhachis 5-30 cm. long; corolla-tube up to 2.5 cm. long, (1.2-)2-3 times longer than the calyx; leaves elliptic or ovate, entire, 8-20 cm. long, 3-10 cm. broad, glabrous [18. buchholzii](#)
- Inflorescence capitate, with the rhachis abbreviated, 0.5-1 (-2) cm. long; corolla-tube 3-4 cm. long, 5-8 times longer than the calyx; leaves elliptic, 9-20 cm. long, 4-9 cm. broad, glabrous or minutely puberulous beneath, entire or frequently dentate [19. schweinfurthii](#)
- 22** Inflorescence a solitary, terminal, densely head-like cluster; corolla-tube at most 1.5 cm. long: **23**
- Inflorescence laxly branched or if clustered not contracted into a single head: **25**
- 23** Corolla-tube 3-4 times longer than the calyx; calyx-teeth deltoid; (other characters as above) [16. welwitschii](#)
- Corolla-tube 1-1.5 times longer than the calyx; calyx-teeth lanceolate to subulate: **24**
- 24** Calyx 10-15 mm. long, with the teeth ciliate; leaves deltoid; flowers usually double; introduced erect undershrub; (other characters as below) [11. japonicum](#)
- Calyx 6-9 mm. long, pilose all over; leaves broadly ovate or elliptic, all of margin serrate or obscurely dentate, scabrous-pubescent above, yellow-tomentose to greyish-pubescent beneath; corolla-tube 10-14 mm. long; native climbing shrub [20. sinuatum](#)
- 25** Inflorescence on young, leafy branches, terminal or axillary; calyx-teeth 2-4 mm. long; leaves elliptic or ovate,

- rounded, subcordate or subcuneate at base, 6-20 cm. long, 4-10 cm. broad, glabrous on both sides; petiole 3-20 mm. long [21. splendens](#)
- Cauliflorous; inflorescence leafless, much-branched; calyx-teeth about 1 mm. long; corolla-tube about 1.5 cm. long or perhaps longer, puberulous, about 1 mm. broad when pressed; leaves elliptic, 10-20 cm. long, 4-8 cm. broad, glabrous [22. bipindense](#)
- 26** Leaves opposite or subopposite: **27**
 Leaves in whorls of mostly 3; inflorescence always terminal:
- 27** Calyx 5 mm. long or longer, the tube 3-5 times longer than the teeth; frequently cauliflorous; leaves glabrous; (see also above) 18. buchholzii **28**
 @
- 28** Calyx less than 5 mm. long or if longer then leaves markedly pilose:
 Calyx-lobes as broad as or broader than long, usually spreading; pedicels slender, mostly more than 5 mm. long; leaves glabrous: **29**
 Calyx-lobes longer than broad, mostly erect; pedicels short, usually less than 5 mm. long; inflorescence frequently clustered; leaves usually pilose, especially on the nerves beneath: **32**
- 29** Whole plant turning black when dry; petiole fairly long, more than 3 cm. long, lamina ovate, cordate at base, 6-10 cm. long and almost as broad; corolla-tube glabrous or nearly so, less than 1 cm. long, usually less than 1 mm. broad when pressed; corolla-lobes 2-3 mm. long; inflorescence terminal [23. melanocrater](#)
- Plant not turning black when dry; petioles short, up to about 2 cm. long; corolla-lobes longer; corolla-tube 6-10 mm. long; inflorescence terminal: **30**
- 30** Branches puberulous; inflorescence elongate, the internodes of the rhachis usually 2 cm. or more long; corolla-tube 2 mm. or more broad when pressed, densely pilose; leaves ovate or elliptic, acuminate, 6-14 cm. long, 3-7 cm. broad [24. thyrsoidium](#)
- Branches glabrous; inflorescence short, usually subcorymbose, the internodes of the axis less than 1 cm. long; corolla-tube less than 1 mm. diam. when pressed, almost glabrous; leaves ovate or elliptic, acuminate, 5-15 cm. long, 2-7 cm. broad [25. volubile](#)
- 31** Calyx and the whole inflorescence hairy all over, 5-7 mm. long; leaves opposite, 12-18 cm. long, 7-12 cm. broad, broadly ovate, pubescent on both surfaces; inflorescences composed of few rather large head-like clusters [26. inaequipetiolatum](#)
- Calyx minutely puberulous to almost glabrous, 2-4 mm. long; leaves mostly opposite, rarely in whorls of 3, rounded or sometimes cuneate at base, elliptic to ovate, glabrous above or slightly pubescent on the midrib only, pubescent on the midrib and nerves beneath; corolla-tube about 5 mm. long [27. dusenii](#)
- 32** Branches hollow in the internodes; leaves acuminate at apex, usually short-cuneate at base, elliptic, 4-10 cm. long, 2-5 cm. broad, quite glabrous (except sometimes midrib beneath); calyx 2-3 mm. long; corolla-tube very short, 4-5 mm. long; axis of inflorescence short, branches long and almost horizontally spreading [28. formicarum](#)
- Branches solid; leaves glabrous, puberulous or pilose:
- 33** Flowers in head-like clusters or on almost horizontally spreading branches; leaves ovate, truncate or mostly subcordate at base, 7-15 cm. long, 4-10 cm. broad, entire, pubescent above; branches with yellow indumentum [29. polycephalum](#)
- Flowers in terminal, subcorymbose, thyrsoid inflorescences; calyx 2-3 mm. long, teeth very acute, minutely puberulous outside; corolla-tube 5-8 mm. long; leaves ovate, acuminate at apex, short-cuneate at base, smooth, 3-14 cm. long, 2-6 cm. broad, glabrous or finely whitish-tomentellous [30. glabrum](#)

1. *Clerodendrum alatum* Gürke in Engl. Bot. Jahrb. 18: 182 (1893); F.T.A. 5: 311; Thomas l.c. 83.

*APD: Synonym of *Rothea alata* (Gürke) Verdc.*

Clerodendrum fleuryi A. Chev. in Mém. Soc. Bot. Fr. 2, 8: 191 (1911); Chev. Bot. 508; F.W.T.A., ed. 1, 2: 273; Thomas l.c. 83.
Clerodendrum lelyi Hutch. & Dalz. in Kew Bull. 1921: 395.

An erect subherbaceous plant, 2-4 ft. high; flowers blue-purple with the upper corolla-lobes white; inflorescence a thyrsoid panicle.

IV. C.: Langouassou to Fétékro, Boualé-Nord (July) Chev. 22160! **N. Nig.:** Ropp (July) Keay FHI 37099! Vom, Jos Plateau Dent Young 205! Mongu, 4,300 ft. (fr. July) Lely 384! Kilba country (July) Dalz. 119! Biu, Bornu Prov. (fl. & fr. Sept.) Noble 18!

Also **Cameroun, Congo, Egypt, Sudan** and **Ethiopia**.

2. *Clerodendrum violaceum* Gürke l.c. 28: 303 (1900); F.T.A. 5: 520; Thomas l.c. 82.

APD: Synonym of Rothea violacea (Gürke) Verdc. subsp. violacea

Clerodendrum kalbreyeri Bak. in F.T.A. 5: 311 (1900).

Clerodendrum noiroti A. Chev. Bot. 508, name only.

A straggling or climbing shrub with almost glabrous leaves and conspicuous violet, violet and white or greenish flowers up to 1 in. across; inflorescence a terminal panicle.

Guin.: Labé Chev. 12393! Mamou to Labé (Mar.) Jac.-Fél. 796! Dalaba (Mar.) Dalz. 8403! Macenta (Oct.) Baldwin 9770! **S. L.:** Hill Station Smythe 105! Koinadugu (fr. Apr.) Glanville 198! 4. *Clerodendrum tomentellum* Hutch. & Dalz. F.W.T.A., ed. 1, 2: 272, 273 (1931); Thomas l.c. 83.

APD acc

Erect shrub or small, tortuous tree with the young parts densely tomentose; flowers large, up to 1 in. across, with 4 white and 1 mauve corolla-lobes; inflorescence a terminal panicle.

N. Nig.: Vom, Jos Plateau Dent Young 205a! Jos Plateau (May) Lely P264! Naraguta F.R. (June) Kennedy 7255! Heipang Tabo, 4,300 ft. (fl. & fr. Jan.) Wimbush FHI 41824!

5. *Clerodendrum aculeatum* (Linn.) Griseb. Fl. Brit. W. Ind. 500 (1864); Thomas l.c. 90; Berhaut Fl. Sén. 97, 98, 109.

APD: Synonym of Volkameria aculeata L.

Volkameria aculeata Linn. (1753).

Erect shrub; branches with small opposite conical thorns; flowers white, in few-flowered inflorescences from the upper nodes.

Sen.: Farmar! near Hann beach, Dakar (May) Baldwin 5743! St. Louis (cult.) Brunner 36! Manulea Rufisque Chev.! **Port. G.:** Cacheu (cult., Oct.) Esp. Santo 2276!

A native of the W. Indies; introduced into Africa.

6. *Clerodendrum eupatorioides* Bak. in F.T.A. 5: 295 (1900); Thomas l.c. 55.

APD: Synonym of Eremomastax speciosa (Hochst.) Cufod.

Stem erect, herbaceous, 4-6 ft. high, glandulose-pilose; flowers white, in dense terminal cymes.

[Br.] Cam.: Cam. Mt., 2,000 ft. (Dec.) Mann 1295!

[This plant, the fruits of which are unknown, must be regarded as doubtfully belonging to *Clerodendrum*.]

7. *Clerodendrum umbellatum* Poir. Encycl. Meth. Bot. 5: 166 (Jan. 1804). *APD acc*

Clerodendrum scandens P. Beauv. Fl. Oware 1: 52, t. 62 (Sept.-Oct. 1804); F.T.A. 5: 304; F.W.T.A., ed. 1, 2: 274; Thomas l.c. 58

(incl. vars. *asperifolium* B. Thomas l.c. 59 (1936), and *speciosum* (Teysm. & Binn.) B. Thomas l.c. (1936)); Chev. Bot. 508.

A climbing shrub up to 20 ft. high, or sometimes suberect; flowers white, sometimes with a pink throat, calyx green below and white above.

Also in **Kenya** and **Tanganyika**.

14. *Clerodendrum whitfieldii* Seem. in Bonplandia 10: 250 (1862); Thomas l.c. 64. *APD acc*

S. L.: Whitfield!

This species is known only from a single specimen.

15. *Clerodendrum acerbianum* (Vis.) Benth. & Hook. Gen. Pl. 2: 1156 (1876); F.T.A. 5: 295; Thomas l.c. 89; Berhaut Pl. Sén. 98, 100, 119.

APD: *Synonym of Volkameria acerbiana Vis.*

Volkameria acerbiana Vis. Ic. Pl. Aegypt. Nub. 23, t. 4 (1836).

Erect or scrambling shrub, densely pubescent to tomentose; flowers white in lateral and terminal, long-peduncled clusters.

Gam.: Pirie 46! Ouassadon Berhaut 794. **Port. G.:** Piche to Buruntuma (July) Esp. Santo 2707!

Widespread through **Egypt**, **Sudan**, and the drier parts of E. Africa from Somaliland to **Tanganyika**.

16. *Clerodendrum welwitschii* Gürke in Engl. Bot. Jahrb. 18: 174 (1893); F.T.A. 5: 308; Thomas l.c. 60. *APD acc*

Clerodendrum eketense Wernham in J. Bot. 52: 32 (1914); F.W.T.A., ed. 1, 2: 273.

A climbing shrub with large leaves and brown-pubescent branches; flowers white in dense terminal inflorescences.

S. Nig.: Eket Talbot 3033! Ikette Plateau, 5,200 ft., Obudu Div. (Dec.) Savory & Keay FHI 25189!

Also in **Cameroun**, **Congo** and **Angola**.

17. *Clerodendrum incisum* Klotzsch in Peters Reise Mossamb. Bot. 257 (1862); F.T.A. 5: 307; Thomas l.c. 78.

APD: Synonym of Rothea incisa (Klotzsch) Steane & Mabb.

An erect, subherbaceous plant with very long-tubular flowers in rather few-flowered, dense terminal inflorescences.

S. Nig.: Benin Kennedy 1420! Sapoba Kennedy 2640!

Distributed from **Somalia** to Mozambique; probably only introduced into our area.

18. *Clerodendrum buchholzii* Gürke in Engl. Bot. Jahrb. 18: 176 (1893); F.T.A. 5: 301; Thomas l.c. 69.

APD: Synonym of Clerodendrum silvanum var. buchholzii (Gürke) Verdc.

Clerodendrum preussii Gürke l.c. 175 (1893); F.T.A. 5: 302; Thomas l.c. 69.

Clerodendrum schifferi A. Chev. Bot. 509, name only.

A glabrous woody climber up to 30 ft. high with petiolar thorns; frequently cauliflorous; flowers white, fragrant; fruits red, with the calyx enlarged, white.

Guin.: Dalaba (Sept.) Schnell 6871! Kouria (Sept., Oct.) Caille in Hb. Chev. 14899; 15049! **S. L.:** Bumba (Sept.) Thomas 1921! Gbangbama (fr. Nov.) Deighton 2358! Rokupr (Sept.) Jordan 124! 30. *Clerodendrum glabrum* E. Mey. Comm. Pl. Afr. Austr. 273 (1837); F.T.A. 5: 297; Thomas l.c. 76.

APD: Synonym of Volkameria glabra (E. Mey.) Mabb. & Y.W. Yuan

A glabrous to minutely tomentellous shrub with small, white flowers in dense, subcorymbose inflorescences; **introduced into our area as a hedge plant.**

S. L.: Freetown (cult., June) Deighton 4623! Newton (cult., Nov.) Deighton 3349!

From Mombasa southwards to the eastern Cape Province; also in **Angola**.

10. VITEX

Linn.-F.T.A. 5: 315; Pieper in Engl. Bot. Jahrb. 62, Beibl. 141 (as "142"): 1-91 (1928); Moldenke in Phytologia 5 & 6 (1955-58).

- 1 Cymes arranged in terminal or terminal and axillary panicles; fruit globose, up to about 5 mm. diam.; leaves 5-foliolate, leaflets broadly obovate to elliptic, acuminate, puberulous beneath on the nerves, otherwise glabrous and densely dotted with yellow glands; central leaflets with petiolule 5-18 cm. long, 3-5-9 cm. broad; calyx truncate, with obsolete teeth; corolla with a right-angle bend, about twice as long as the calyx [1. thyriflora](#)
Cymes axillary or axillary and terminal, arranged in compound dichasia; fruits obovoid to sub-globose, 1 cm. or more long: [2](#)
- 2 Calyx and pedicels minutely puberulous (hairs shorter than 1/3 of the diam. of the pedicel); leaves glabrous beneath or pubescent only on the nerves, 5-7-foliolate: [3](#)
Calyx and pedicels distinctly pilose to tomentose (hairs at least half as long as, mostly longer than, the diameter of the pedicel): [8](#)
- 3 Leaflets crenate or dentate, at least in the apical 1/3, acuminate; central leaflet with 9-10 pairs of lateral nerves; ovary glabrous: [4](#)
Leaflets entire: [5](#)
- 4 Calyx and pedicels with short, appressed indumentum; flowers about 6 mm. long; leaflets obovate-cuneate to oblanceolate, shortly acuminate, the middle one 2-5-10 cm. long, 1-3 cm. broad [2. micrantha](#)
Calyx and pedicels with short, patent indumentum; flowers about 7 mm. long; leaflets obovate to obovate-oblong, mostly long-acuminate, the middle ones 8-25 cm. long, 2-5-8 cm. broad [3. oxycuspis](#)
- 5 Peduncle 10-20 cm. long; ovary glabrous, with sessile glands; corolla less than 1 cm. long: [6](#)
Peduncle 0-5-8 cm. long; ovary densely pilose at apex with erect hairs; corolla mostly 1-2 cm. long: [7](#)
- 6 Middle leaflets with 4-8 pairs of lateral nerves, leaflets obovate-cuneate, abruptly acuminate at apex, narrowly cuneate at base, central ones 12-25 cm. long, 4-5-10 cm. broad; calyx 3-5 mm. long [4. lehmbachii](#)
Middle leaflets with 12-20 pairs of lateral nerves, leaflets elliptic, elliptic-oblong or broadly lanceolate, acuminate at apex, shortly cuneate at base, central ones 8-18 cm. long, 3-6 cm. broad; calyx about 1-1-5 mm. long [5. rivularis](#)
- 7 Leaflets obtuse or broadly deltoid or rarely shortly apiculate at apex, obovate to elliptic, the middle ones 5-18 (rarely 20) cm. long including the petiolule, 4-10 cm. broad, with the petiolule 1-2-5 cm. long; peduncle 2-8 cm. long; calyx 3-4 mm. long; inflorescences congested [6. doniana](#)
Leaflets abruptly short- to long-acuminate at apex, obovate-cuneate, the middle ones usually 13-40 cm. long, 6-

- 20 cm. broad, very gradually and narrowly attenuated into a usually very short petiolule, rarely exceeding 1 cm. in length; peduncle 0.5-5 cm. long [7. grandifolia](#)
- 8 Ovary glabrous or with very few solitary hairs on the top, with sessile glands; calyx-teeth 0.4-1.5 mm. long; peduncles 4-16 cm. long;..... [9](#)
- Ovary densely pilose with erect hairs; calyx 4-5 mm. long, actinomorphic, with the teeth mostly 2-3 mm. long; peduncles wanting or up to 6 cm. long; middle leaflet with 8-20 pairs of lateral nerves:..... [12](#)
- 9 Leaves 5(-7) foliolate, middle leaflet mostly with 10-12 pairs of lateral nerves; calyx 1-2 mm. long, actinomorphic:..... [10](#)
- Leaves 1-3(-5)-foliolate; calyx 2.5 mm. long, bilabiate; indumentum greyish-white to pale yellow; lateral nerves (when leaves compound of the middle leaflet) 5-12(-14) pairs:..... [11](#)
- 10 Inflorescence and petioles glabrous or glabrescent; leaflets glabrous or glabrescent beneath except on the nerves; indumentum (distinct only in very young parts) greyish to yellowish-white (other characters as above)[5. rivularis](#)
- Inflorescence, petioles, undersurface of the leaves and young branches densely villous with long rust-red to orange-brown hairs; peduncles 4-16 cm. long; leaflets obovate, the middle one 9-16 cm. long, 4-7.5 cm. broad, usually with 10-16 pairs of lateral nerves[8. phaeotricha](#)
- 11 Leaves all 3(-5) foliolate, obovate, obovate-oblong to lanceolate, entire or crenate on the margin, at first tomentose beneath, later frequently glabrescent except on the nerves; middle leaflet 1.5-4 times as long as broad, 5-15 cm. long and 2.5-9 cm. broad, with 8-12(-14) pairs of lateral nerves; calyx often irregularly pilose[9. madiensis](#)
- Leaves in the floral region undivided or with a few ternate ones among them; simple leaves broadly ovate to ovate-acuminate, persistently tomentose beneath, margins entire, in compound leaves the middle leaflet obovate; leaf 1-2 times as long as broad, 5-14 cm. long and 3.5-10 cm. broad, with 5-10 pairs of lateral nerves; calyx densely tomentose with flexuous hairs[10. simplicifolia](#)
- 12 Peduncles 0-2 cm. long; fruit glabrous when mature except at the apex; inflorescence and young leaves frequently with a dark greyish-yellow pubescence; leaves 5-7 foliolate, leaflets long-acuminate, obovate to elliptic, entire or often crenate, pubescent beneath, the central one 5-14 cm. long and 2-5 cm. broad, with 10-12 pairs of lateral nerves [11. ferruginea](#)
- Peduncles 2-6 cm. long; fruit yellowish-puberulous all over even when ripe; inflorescence and undersurface of leaves persistently tomentose with greyish-white to pale-yellow indumentum; leaves 3-5-foliolate, leaflets obtuse or triangular at apex, obovate or elliptic, entire or frequently crenate, central ones 5-12 cm. long and 2.5-5 cm. broad, with 8-14 pairs of lateral nerves [12. chrysocarpa](#)

1. *Vitex thyrsoflora* **Bak.** in Eew Bull. 1895: 152; F.T.A. 5: 319; Pieper l.c. 54; Aubrév. Fl. For. C. Iv., ed. 2, 3: 233; Moldenke in Phytologia 6: 152. **APD acc**

Vitex staudtii **Gürke** in Engl. Bot. Jahrb. 33: 299 (1904).

Vitex obanensis **Wernham** in Cat. Talb. 92 (1913).

Vitex agraria **A. Chev.** Bot. 505, name only.

An undershrub or small tree with glabrous branches, 5-foliolate leaves and small white flowers in terminal panicles; **in forest**.

Vitex agnus-castus L.

An ornamental shrub from the Mediterranean region,

Is occasionally cultivated in our area.

Vitex milnei Pieper in Engl. Bot. Jahrb. 62, Beibl. 141 (as 142): 71 (1928); Moldenke in Phytologia 5: 475 (1957).

Vitex divaricata Bak. in F.T.A. 5: 327 (1900), not of Sweet (1788).

Vitex cienkowskii of F.W.T.A., ed. 1, 2: 276, partly (syn. & Milne).

F. Po: Milne!

Further material is required in order to decide the status of this plant. It differs from *V. doniana* in having a smaller calyx (2 mm. long) and a laxer inflorescence, and when better known it may prove to be recognisable as a distinct infraspecific taxon of that species. Pieper also cites Isert, and Warnecke 156a from Togo.

Vitex sp. A.

Trees with large digitate leaves and rather membranaceous leaflets.

S. Nig.: Okomu F.R., Benin Brenan 9188! **[Br.] Cam.:** Bambuko F.R., Kumbo Olorunfemi FHI 30751!

Flowers are required to decide if these are distinct from *V. grandifolia* or whether they are referable to the Cameroun species *V. zenkeri* Gürke (in Engl. Bot. Jahrb. 33: 293 (1903)).

Vitex sp. B.

A tree close to *V. rivularis* from which it differs by having the leaves more scabridulous on both sides, obtuse or shortly deltoid at the apex, and the central leaflet with 9-10 pairs of lateral nerves.

[Br.] Cam.: S. Bakundu F.R., Kumba (fr. Aug.) Olorunfemi FHI 30712!

AVICENNIACEAE

Shrubs or trees, branches terete. Leaves opposite and decussate, simple, entire; stipules absent. Inflorescences axillary or terminal; flowers sessile, hermaphrodite, actinomorphic. Calyx very deeply 5-lobed, lobes imbricate, subtended by a pseudo-involucre composed of a scale-like bractlet and 2 alternate scale-like prophylla. Corolla gamopetalous, campanulate-rotate, actinomorphic, deeply 4-lobed. Stamens 4, inserted in throat of the corolla-tube, equal or subdidynamous. Ovary superior, with 2 united carpels, placenta free, central. Style shortly divided. Ovules 4, pendulous. Fruit dehiscent by 2 valves, usually only 1 seed develops. Seed with 2 cotyledons, embryo viviparous.

A monogeneric family, formerly in Verbenaceae, inhabiting the maritime regions of the tropics and subtropics around the world and forming characteristic mangrove thickets.

AVICENNIA

Linn.-F.T.A. 5: 287; Moldenke in Phytologia 7: 123, 179, 259 (1960). *APD acc*

- 1 Branchlets puberulous; leaves lanceolate to oblong-lanceolate, or rarely narrowly elliptic, subacute, acute at the base, up to 18 cm. long and 8 cm. broad, minutely and closely pitted above, with a close grey scurf beneath; lateral nerves 10-12 pairs, looped and forming an ultra-marginal nerve, raised on both surfaces; flowers crowded at the end of short peduncles, these often forming a small panicle; bracts imbricate, ovate, shortly pointed, about 4 mm. long, tomentellous; fruit obliquely ellipsoid, 2.5 cm. long, beaked, tomentellous [africana](#)

Avicennia africana *P. Beauv.* Fl. Oware 1: 80, t. 47 (1809); F.T.A. 5: 331; Chev. Bot. 510; Exell Cat. S. Tomé 265; De Sousa in Anais Jun. Inv. Col. 3: 52 (1949); Moldenke in Phytologia 7: 146 (1960).

APD: *Synonym of Avicennia germinans (L.) L.*

Avicennia nitida of F.W.T.A., ed. 1, 2: 270; Berhaut Fl. Sén. 113, 116; Aubrév. Fl. For. C. Iv. 3: 234, t. 338, not of Jacq.

A shrub or tree up to 50 ft. high with pneumatophores covering the ground round about but stilt roots absent; flowers white with yellow centre; [in mangrove thickets](#). The black mangrove.

Rosevear 16! Eket Dist. Talbot 1 **[Br.] Cam.:** Victoria (fr. July) Maitland 30! **F. Po.:** Mann 231! Milne!

Extends along the coast of western Africa to Cabinda and Congo; also in S. Tomé.

If this plant is regarded as conspecific with similar ones in [America](#), as does Compere in Taxon 12: 150-162 (1963), the correct name appears to be *A. germinans* (Linn.) Linn.

LABIATAE

Herbaceous or rarely woody, often odoriferous. Stems usually quadrangular. Leaves opposite or whorled, simple; stipules absent. Flowers hermaphrodite, zygomorphic, rarely almost actinomorphic, axillary, whorled, racemose or paniculate. Calyx persistent, of 5 variously united sepals, often 2-lipped. Corolla gamopetalous, hypogynous, tubular; lobes 4-5, imbricate, often forming 2 lips or rarely 1 lip. Stamens inserted in the corolla-tube, 4 or 2; anthers 2-celled, cells often divergent, opening lengthwise. Ovary superior, of 2 deeply lobed carpels, the style (gynobasic) arising from the inner base of the lobes; stigmas mostly bifid. Ovules 4 in each ovary, erect. Fruit of 4 achene-like nutlets, free or cohering in pairs. Seeds with usually straight embryo without endosperm, or the latter very scanty.

A large cosmopolitan family of herbs or undershrubs.

Recognised by the usually 4-angled stems, opposite (very rarely alternate) leaves, commonly glandular and odoriferous, deeply lobed ovary with gynobasic style, and by the fruit of 4 nutlets.

- 1 Calyx with all the teeth equal, or nearly equal, in size and shape without a distinct lip: [2](#)

 Mature calyx 8-10 mm. long; large, stout erect plant [19. Isodictyophorus](#)
- 8 Mature calyx dry; stamens 4: [9](#)
 Mature calyx forming an orange berry about 8 mm. diam.; stamens 2 [10. Hoslundia](#)
- 9 Calyx teeth 4 [5. Geniosporum](#)
 Calyx teeth 5: [10](#)
- 10 Calyx teeth subulate [21. Hyptis](#)
 Calyx teeth not subulate, either triangular, lanceolate, or lanceolate-acuminate: [11](#)
- 11 Calyx with teeth as long as, or longer than, the tube [20. Neohyptis](#)
 Calyx with teeth much shorter than the tube: [12](#)
- 12 Calyx teeth narrow, lanceolate, long-acuminate [22. Satureja](#)
 Calyx teeth broad, triangular, not acuminate [25. Achyrospermum](#)
- 13 Calyx circumscissile in fruit: [14](#)
 Calyx not circumscissile: [15](#)
- 14 Leaves opposite; rootstock annual and fibrous or perennial and creeping [11. Aeolanthus](#)
 Leaves alternate; rootstock perennial, tuberous, not creeping [12. Icomum](#)
- 15 Calyx with 8-10 teeth: [16](#)
 Calyx with up to 5 teeth: [17](#)
- 16 Upper and lower lips of corolla about equal in length; middle lobe of lower lip larger than the lateral ones [27](#).
 [Leucas](#)
 Upper lip of corolla much longer than the lower; middle lobe of lower lip scarcely longer than the lateral ones [28](#).

Leonotis

- 17 Calyx bladder-like in fruit [29. Tinnea](#)
 Calyx not bladder-like in fruit: 18
- 18 Calyx distinctly 2-lipped: 19
 Calyx not 2-lipped, though frequently with one lobe larger than the others and forming a single lip: 23
- 19 Inflorescences of dense, globose, terminal heads, frequently with large coloured bracts [9. Haumaniastrum](#)
 Inflorescences not as above: 20
- 20 Corolla markedly zygomorphic, with lower lip deeply concave: 21
 Corolla not markedly zygomorphic; lower lip not deeply concave: 22
- 21 Inflorescence with 2 flowers at each node [24. Scutellaria](#)
 Inflorescence with many flowers at each node [17. Solenostemon](#)
- 22 Calyx-tube much longer than broad; flowers dark pink [3. Endostemon](#)
 Calyx-tube about as long as broad; flowers more or less white [4. Platostoma](#)
- 23 Calyx with 3 broadly triangular or ovate lobes: 24
 Calyx not as above, at least some of the teeth lanceolate-acuminate or subulate: 25
- 24 Inflorescences in rather lax racemes; stamens 2 [23. Salvia](#)
 Inflorescences dense, conical or oblong; stamens 4 [25. Achyrospermum](#)
- 25 Upper calyx-lobe oblong or lanceolate: 26
 Upper calyx-lobe broadly ovate or triangular: 27
- 26 Upper calyx-lobe longer than the others [16. Leocus](#)
 Upper calyx-lobe not longer than the others [22. Satureja](#)
- 27 Calyx with dense fringe of short white cilia between the teeth [2. Becium](#)
 Calyx not as above: 28
- 28 Inflorescence with large, pink, ovate or rotund bracts enveloping the flowers [8. Hemizygia](#)
 Inflorescence not as above: 29
- 29 Lower lip of corolla much enlarged and keeled: 30
 Lower lip of corolla not enlarged or keeled: 31
- 30 Calyx with median teeth deltoid or obsolete [17. Solenostemon](#)
 Calyx with median teeth well developed and acuminate [14. Plectranthus](#)
- 31 Mature calyx up to 2 mm. long, upper lip not or slightly decurrent on the tube [6. Basilicum](#)
 Mature calyx 5 mm. or more long, upper lip decurrent on the tube: 32
- 32 Stigma capitate [7. Orthosiphon](#)
 Stigma deeply bifid [1. Ocimum](#)

Mentha

(? *M. × gentilis* Linn.). Species of *Mentha* are occasionally cultivated as herbs but apparently do not flower in these latitudes.

1. OCIMUM

Linn.-F.T.A. 5: 334.

- 1 Calyx twice as long as broad when viewed from above; perennials: 2
 Calyx orbicular when viewed from above; leaves at most shallowly serrate; annuals; stems square; leaves distinctly petiolate, thin, ovate to obovate, cuneate at base, acuminate; inflorescence lax, elongate; calyx with upper lobe orbicular and much longer than the very short tube, lower lobes deltoid-mucronate, slightly exceeding the upper; stamens slightly exserted: 5
- 2 Calyx dull, densely woolly; spikes dense, whorls continuous except at base; calyx 7 mm. long in fruit, upper lip ovate, apiculate, lower teeth small, deltoid; leaves pubescent, ovate to ovate-lanceolate, acutely acuminate, 7-10 cm. long, 2-4 cm. broad; petiole 1-3 cm. long [1. suave](#)
 Calyx glossy, glabrous or nearly so; spikes rather lax: 3

- 3 Leaves linear, about 3 cm. long and 3 mm. broad, or less, glabrous with a slightly wavy margin, gland-dotted; stems stiff, erect, glabrous, leafy; inflorescence a lax terminal raceme, bracts minute; pedicels about half as long as the fruiting calyx, arcuate, puberulous; fruiting calyx 8 mm. long, tube twice as long as the teeth, thinly gland-dotted; upper lip recurved, deltoid; lower teeth ovate, subulate [2. *irvinei*](#)
- Leaves ovate: [4](#)
- 4 Calyx about 6 mm. long in fruit; leaves 6-12 cm. long and 3 cm. broad, ovate to obovate, cuneate at base, acutely acuminate, subglabrous beneath but gland-pitted and slightly pubescent on the nerves; whorls only continuous in flower, interrupted in fruit; pedicels puberulous; calyx 2-lipped, upper lip broadly ovate and mucronate, lower lip oblong with 2 teeth [3. *gratissimum*](#)
- Calyx about 10 mm. long in fruit; leaves 2-5 cm. long ovate, acute, petiolate, pubescent beneath; spikes long, lax, often branched at base; bracts bright-coloured; calyx with upper lip ovate, obtuse, lower lip with 2 large teeth; stamens long-exserted [4. *lamiifolium*](#)
- 5 Mature calyx about 6 mm. diam.; corolla large, twice as long as the calyx or more; plant bushy, 50 cm. or more in height, usually subglabrous [5. *basilicum*](#)
- Mature calyx about 4 mm. diam.; corolla small, hardly exceeding the calyx; plant smaller, 30-45 cm. high, pubescent [6. *canum*](#)

1. ***Ocimum suave* Willd.** Enum. Pl. Hort. Berol. 629 (1809); F.T.A. 5: 338.

APD: Synonym of *Ocimum gratissimum* L. var. *gratissimum*

Ocimum trichodon Bak. ex Gürke (1895)-F.T.A. 5: 338; F.W.T.A., ed. 1, 2: 286.

Ocimum dalabaense A. Chev. (1909)-Chev. Bot. 511.

Ocimum caillei A. Chev. Bot. 511, name only.

A branched, erect, pubescent, aromatic shrub reaching several feet in height with dense spikes of small greenish-white flowers.

Guin.: Fouta Djallon 3,000-3,500 ft. (Sept.) Chev. 18382! 18637! Labé (Mar.) Chev. 12382! Mali to Kédougou (Apr.) Pilot T51-1180! Dalaba (Oct.) Adam 12583! Niguelandé (Mar.) Adam 11632! **N. Nig.:** Jos Plateau (Oct.) Lely P798! Ropp Morton A2043! **[Br.] Cam.:** Mambila Plateau (Jan.) Hepper 1689!

Also in **Cameroun**, **Congo** and **E. Africa**, and widespread in tropical Asia.

2. ***Ocimum irvinei* J. K. Morton** in J. Linn. Soc. 58: 266, t. 1 (1962). *APD acc*

An erect herb about 18 in. high; stems several from a perennial woody rootstock with thick roots; flowers pink rarely white; **in seasonally marshy savanna.**

Ghana: N.W. Ashanti: near Nwereme (May) Irvine 2498! New Drobo (Nov.-Apr.) Harris! Morton A3876! A3877! Dwinim (fr. Dec.) Adams 5294! Adamsu (Apr.) Morton A3238! W. of Bimbila, Dagomba Dist. (Jan., Mar.) Hepper & Morton A3096! Akpabla 1853!

3. ***Ocimum gratissimum* Linn.** Sp. Pl. 2: 1197 (1753); Chev. Bot. 511 (as var. *macrophyllum* Briq.); Morton l.c. 232 (1962). *APD acc*

Ocimum viride Willd. (1809)-F.T.A. 5: 337; Chev. Bot. 512; F.W.T.A., ed. 1, 2: 285.

Ocimum guineense Schum. & Thonn. (1827).

Similar to *O. suave* but subglabrous; **usually occurring around villages.** The Tea Bush.

Gam.: Albredaar (Nov.) Gardiner 37! **Port. G.:** Gidade, Bissau (Oct.) Esp. Santo 945! **Guin.:** Korse (Mar.) Adam 11706! Beyla (Mar.) Chev. 20901! **S. Also in Congo, E. and S. tropical Africa and in India.

2. *Orthosiphon incisus* A. Chev. in Mém. Soc. Bot. Fr. 2, 8: 199 (1912); Chev. Bot. 515.

APD: *Synonym of Orthosiphon pallidus Royle ex Benth.*

Orthosiphon salagensis of Chev. Bot. 515; of F.W.T.A., ed. 1, 2: 286, partly; not of Bak.

A small, annual, pubescent, bushy, aromatic herb, under 12 in. high.

Mali: Ouagadougou to Ouahigouya (Aug.) Chev. 24698. **Ghana:** Accra (Dec.) Morton GC 6135! Prampram (Oct.) Morton GC 6083! Accra to Ada (June) Morton GC 9237! N. of Nangodi (Dec.) Morton A1261! **Dah.:** Somba, Atacora Mts. (June) Chev. 24120!

3. *Orthosiphon suffrutescens* (Thonning) J. K. Morton in J. Linn. Soc. 58: 266 (1962).

APD: *Synonym of Orthosiphon thymiflorus (Roth) Sleesen*

Ocimum suffrutescens Thonning in Kongel. Dansk. Vid. Selsk. 4: 330 & Bettelser (1829).

Orthosiphon thoningii Thonning Beskr. Guin. Pl. 269 (1827), not O. thonningii Schum. & Thonn. l.c. 265 (1927).

Orthosiphon australis Vatke (1876)-F.T.A. 5: 373.

Orthosiphon rabaiensis var. *parvifolia* S. Moore in J. Bot. 44: 26 (1906).

A slender straggling subglabrous perennial herb of **deciduous and dry forest and thicket**, frequently purple-tinged on the stem, leaves and inflorescence.

Ghana: Mampong Scarp, Akwapim (June) Morton GC 9325! Afram Mankrong F.R. (Dec.) Adams 4935! Swedru (Feb.) Dalz. 8279! Asafo road junction, Accra to Cape Coast (Mar.) Morton A251! Fume, Transvolta (Nov.) Morton A959! **S. Nig.:** (Oct.) Foster 348!

Also in **Congo** and widespread in E. Africa.

[Very closely allied to, and probably only racially distinct from O. glabratus Benth. in India.]

8. HEMIZYGIA

APD: *Synonym of Syncolostemon E. Mey.*

(*Benth.*) *Briq.* in E. & P. Pflanzenfam. 4, 3A: 368 (1897); Ashby in J. Bot. 73: 312 (1935).

Bouetia A. Chev. (1912).

- 1 Leaves linear-lanceolate, 5-15 cm. long, 1-2.5 cm. broad, narrowly acute at apex, gradually cuneate at base, sessile or shortly petiolate, hairy on both surfaces; racemes long, lax, hairy; flowers 4-6 in a whorl; pedicels short; upper bracts large, narrowly ovate-lanceolate, reddish, membranous; calyx 7-8 mm. long in fruit, upper lip orbicular, lower teeth long and subulate; corolla twice as long as the calyx, 2-lipped; stamens long-exserted; whole plant covered densely with long, straight hairs [1. *bracteosa*](#)

Leaves ovate to ovate-lanceolate, 2.5-5 cm. long, 1-2.5 cm. broad, broadly acute at apex, rounded to cuneate at base, sessile or nearly so, pubescent; racemes shorter and denser, hairy; flowers 6 in a whorl; pedicels short, stout, pubescent; upper bracts large ovate-orbicular, reddish, membranous; calyx about 10 mm. long in fruit, upper lip broadly ovate, lower teeth long and subulate; corolla and stamens as above; whole plant covered fairly densely with crispate hairs [2. *welwitschii*](#)

1. *Hemizygia bracteosa* (*Benth.*) *Briq.* in Ann. Jard. Gen. 2: 248 (1898); Ashby in J. Bot. 73: 318, 350 (q.v. for syn.).

APD: *Synonym of Syncolostemon bracteosus* (*Benth.*) D.F. Otieno

Ocimum bracteosum Benth. (1832).

Orthosiphon bracteosus (*Benth.*) Bak. in F.T.A. 5: 375 (1900); F.W.T.A. ed. 1, 2: 286.

Hemizygia nigrifolia S. Moore (1909).

Bouetia ocymoides A. Chev. (1912)-Chev. Bot. 513.

An erect greyish pubescent annual up to 3 ft. high, with pale pink flowers and clusters of pink bracts at the top of the inflorescence; in marshy grassland.

Sen.: Heudelot 396! **Dah.:** Agouagon (May) Chev. 23546! Pobégou to Birni, Atacora Mts. (June) Chev. 23945! **N. Nig.:** Nupe Barter 946! Alagbede, Ilorin (Feb.) Ejiofor FHI 19807a! Yola (May) Dalz. 108! **S. Nig.:** "W. Prov." Kitson! [**Br.**] **Cam.:** Alantika Mts., Adamawa (Dec.) Hepper 1606!

Widespread in tropical and S. Africa.

2. *Hemizygia welwitschii* (*Rolfe*) M. Ashby in J. Bot. 73: 318, 350 (1935). *APD acc*

Orthosiphon wetwitschii Rolfe (1893)-F.T.A. 5: 376.

O. bracteosus of F.W.T.A., ed. 1, 2: 286, partly.

A bushy, aromatic perennial, up to 2 ft. high, with white flowers and terminal clusters of pink bracts; growing in clumps in dry stony grassland.

N. Nig.: Kafanchan (May) Jones FHI 14106! Zaria (Apr.) Dalz. 285! Jos (Jan., Mar.) Hill 19! Lely P112! Batten-Poole 379! Vom (Feb.) McClintock 198! Gindiri, Pankshin Div. (Oct.) Hepper 1130! [**Br.**] **Cam.:** Bamenda (Apr.-Mar.) Maitland 1599! Morton K190! Ndop to Bamenda (Dec.) Adams GC 11252! Ndop (Dec.) Boughey GC 11141!

Also in **Ubangi-Shari**, **Congo**, **Angola** and **S. Rhodesia**.

9. HAUMANIASTRUM

Duvign. & Plancke in Biol. Jaarb. 27: 222 (1959); Morton in J. Linn. Soc. 58: 239 (1962).

Acrocephalus Benth. (partly)-F.T.A. 5: 354; F.W.T.A., ed. 1, 2: 288.

- 1 Leaves broad, ovate to lanceolate or broadly oblanceolate: **2**
 Leaves narrow, linear to linear-lanceolate or narrowly oblanceolate: **3**
- 2 Leaves sessile, ovate, rounded at base, acutely acuminate, sharply serrate, 2-4 cm. long, 1-2 cm. broad, thick; flower-heads numerous, corymbose; bracts ovate-reniform, broadly apiculate, densely tomentose outside with glabrescent margins [1. *alboviride*](#)
- Leaves distinctly petiolate, ovate-lanceolate to oblanceolate, cuneate at base, subacute, serrulate, 3-6 cm. long, 1-2 cm. broad, thinly pilose on both surfaces; flower-heads few or subsolitary, small, globose, subtended by normal, non-coloured leaves [2. *galeopsifolium*](#)
- 3 Stem and leaves glabrous or nearly so; leaves erecto-patent, narrow, sessile, 3-5-5 cm. long, 3-5 mm. broad, obscurely dentate, densely gland-dotted on both surfaces, with a few hairs on the veins beneath; stem wiry,

- square, purple; flower-heads few, rather large; outer bracts coloured, with a long cusp; inner bracts broadly ovate, lanate [3. *quarrei*](#)
- Stem and leaves densely pubescent; leaves spreading; flower-heads numerous: **4**
- 4** Stem with long spreading pubescence; leaves linear to linear-lanceolate, acute, up to 10 cm. long and 1 cm. broad, usually less, obscurely dentate, thinly to densely long-pubescent and gland-dotted on both surfaces; outer bracts frequently with a white or coloured crenate margin and a short to medium cusp; inner bracts broadly ovate, lanate throughout [4. *lilacinum*](#)
- Stem with closely appressed short pubescence: **5**
- 5** Flower-heads small; inner floral bracts with subglabrous brown margin, lanate below; outer bracts with narrow base, without coloured crenate margin; leaves oblanceolate, acute, subentire, 7 cm. long and 1 cm. broad or less, densely silvery appressed-pubescent especially on the veins beneath [5. *buettneri*](#)
- Flower-heads medium to large; inner floral bracts lanate throughout; outer bracts usually with a broad crenate white or coloured base and a medium to short cusp; leaves linear to linear-lanceolate, acute, more or less dentate, up to 12 cm. long and 2 cm. broad, but usually much less, shortly appressed-pubescent at least on the veins and gland-dotted on both surfaces. [6. *caeruleum*](#)

1. *Haumaniastrum alboviride* (Butch.) Duvign. & Plancke in Biol. Jaarb. 27: 224 (1959). *APD acc*

Acrocephalus alboviridis Hutch. in Kew Bull. 1921: 396; F.W.T.A., ed. 1, 2: 287.

An erect woody plant, 3-4 ft. high, with dark purple stems and pale violet flowers.

Ghana: Shiare to Chilinga, 2,000 ft., Transvolta (fl. Nov., fr. Apr.) Hall 1441! Morton A3959! A3960! A4101! **N. Nig.:** Jos Plateau (Oct.) Lely P847! Vom, 3,000-4,500 ft. Dent Young 207! 2. *Aeolanthus repens* Oliv. in Trans. Linn. Soc. 29: 137, t. 136, fig. A (1875); F.T.A. 5: 395. *APD acc*

APD: Synonym of Aeollanthus cucullatus Ryding

A small creeping herb, with erect flowering stems bearing a few small bluish flowers about 1/4 in. long; [in moist rocky situations and exposed rock-crevices at high elevations](#).

[Br.] Cam.: Bamenda, 4,000-7,000 ft. (Aug.-Feb.) Migeod 495! Savory UCI 377! Ujor FHI 29962! 30222! Maitland 1642! Vogel Peak, Adamawa (Nov.) Hepper 1356!

Also in **Sudan** and **E. Africa**.

3. *Aeolanthus heliotropioides* Oliv. l.c. 137, t. 82 (1875); F.T.A. 5: 393.

APD: Synonym of Aeollanthus suaveolens Mart. ex Spreng.

An erect much-branched, robust aromatic annual, about 2 ft. high, with dense panicles of small violet flowers.

N. Nig.: cult. in Munchi farms, R. Benue Sampson 35! **[Br.] Cam.:** Vogel Peak, Adamawa (Nov.) Hepper 1420!

Also in **Sudan** and **E. Africa**.

12. ICOMUM

Hua-F.T.A. 5: 387.

- 1 Stems short, slender, simple or sparingly branched towards the top, subterete and softly pubescent when young; leaves alternate, linear, entire, up to 3.5 cm. long, sessile, ascending, glandular-punctate; spikes short, dense, forming a small terminal panicle; bracts broadly linear; calyx campanulate, pubescent, teeth minute; corolla-tube cylindrical, pubescent, much exceeding the calyx, lobes small, the lower shallowly saccate [1. paradoxum](#)

Stems very short, softly tomentose when young; young leaves oblong, with small glandular teeth, softly tomentellous; bracts subulate-linear [2. gambicola](#)

1. **Icomum paradoxum** *Hua* in Bull. Mus. Hist. Nat. 3: 329 (1897); F.T.A. 5: 387; Chev. Bot. 513.

APD: *Synonym of Aeollanthus paradoxus (Hua) Hua & Briq.*

Icomum foutadjalensis De Wild. (1928).

Aeollanthus foutadjalense (De Wild.) De Wild. (1928).

Stems 1/4 in. long; corolla white with rose-spotted lip.

Guin.: Moussaia (June) Pobéguin 705! Fouta Djallon (May) Chev. 12750! Timbo (May, July) Miquel 43! Pobéguin 738! Sineya and Toumanea (June) Pobéguin 709!

2. **Icomum gambicola** A. Chev. ex Hutch. & Dalz. F.W.T.A., ed. 1, 2: 282 (1931); Chev. Bot. 513 (1920), name only.

APD: *Synonym of Aeollanthus paradoxus (Hua) Hua & Briq.*

Plant only of a few inches high from a perennial base, with ovoid, fragrant tuber 2-2 1/2 in. long; corolla white.

Guin.: at sources of the Gambia R., 3,300 ft., Fouta Djallon (Apr.) Chev. 13573!

[Perhaps not distinct from *I. paradoxum* Hua-J.K.M.]

13. PYCNOSTACHYS

Hook.-F.T.A. 5: 379; Perkins in Notizbl. Bot. Gart. Berl. 8: 63 (1921); E. A. Bruce in Kew Bull. 1939: 563.

- 1 Leaves ovate-lanceolate to lanceolate, distinctly crenate-serrate; shrubs; spines on calyx sharp to the touch: [2](#)
Leaves linear to linear-lanceolate, serrulate; herbs, sometimes woody; spines on calyx not very sharp to the touch: [3](#)
- 2 Mature calyx densely tomentose, teeth slender, short, about 2.5 mm. long, pale brown; spikes narrow, about 1.5 cm. broad and 2.5-5 cm. long; leaves about 10 cm. long and 4 cm. broad, cuneate at base into a long petiole about 1/3 length of the lamina, thin, shortly pubescent on both surfaces, glandular-punctate beneath [1. eminii](#)
Mature calyx shortly and rather thinly pubescent, teeth stout, about 5 mm. long, dark reddish-brown; spikes stout, 2.5 cm. or more broad, 3-5 cm. long; leaves similar to last species but thicker, densely pubescent and with a shorter petiole [2. meyeri](#)
- 3 Leaves small, up to 3 cm. long and 2 mm. broad, pseudo-whorled and numerous; stems strongly sulcate [3. pallide-caerulea](#)
Leaves large, up to 10 cm. long and 15 mm. broad, sessile, opposite or in whorls of 3, glandular punctate beneath: [4](#)
- 4 Leaves thin, flaccid, opposite with smaller leafy axillary shoots, thinly scabrid up to 10 cm. long and 6 mm. broad; spikes on long slender peduncles, ovoid, 2 cm. diam., with small reflexed bracts at base; stems slender with many spreading branches; corolla about 14 mm. long [4. schweinfurthii](#)
Leaves thick, ascending, 3 in each whorl, 4-10 cm. long, 4-15 mm. broad, appressed-puberulous on veins beneath, otherwise glabrous; spikes solitary, terminal on short stout peduncle, conical, about 3 cm. diam. with spreading leafy bracts at base; stems stout, erect, branches few, ascending; corolla about 13 mm. long [5. reticulata](#)

1. **Pycnostachys eminii** Gürke in Engl. Bot. Jahrb. 22: 145 (1895); F.T.A. 5: 385; E. A. Bruce in Kew

Bull. 1939: 589. *APD acc*

A pubescent aromatic shrub several feet high with cylindrical spikes of pale blue flowers.

[Br.] Cam.: Bambui, 6,300 ft., Bamenda (Dec.) Adams GC 11304! Bamenda, 4,300-5,000 ft. (fl. Feb., May, fr. Mar.) Migeod 475! Morton K105! K137! Vogel Peak, Adamawa (Nov.) Hepper 1489!

Also in [Congo](#) and [E. Africa](#).

2. *Pycnostachys meyeri* Gürke in Engl. Hochgebirgsfl. Afr. 362 (1892); F.T.A. 5: 384; E. A. Bruce l.c. 591. *APD acc*

Pycnostachys volkensii Gürke (1895)-F.T.A. 5: 384; F.W.T.A., ed. 1, 2: 288.

Pycnostachys bowalensis A. Chev. in Journ. de Bot., sér. 2, 2: 126 (1909); Chev. Bot. 521.

Pycnostachys aff. *bowalensis* A. Chev. Bot. 521.

Coleus urticaefolius (Hook. f.) Roberty in Bull. I.F.A.N. 16, 1: 330 (1954), partly.

Similar to the last species but with stouter spikes of bluish-purple flowers.

Guin.: Fouta Djallon, 3,500 ft. (fl. Sept.-Oct., fr. Jan.) Chev. 18544! 18591! 18707! 18853! 20345! Schnell 7081! Labé (Jan.) Roberty 16402! S. Nig.: Koloishe Mt., Obudu Div. (Dec.) Echinostachys reticulata E. Mey. (1837).

An erect half-woody, perennial herb with short spikes of blue flowers; [in marshy grassland](#).

[Br.] Cam.: Gurum, Vogel Peak area, Adamawa (Nov.) Hepper 1600!

Also in [East and Central Africa](#).

14. PLECTRANTHUS

L'Hérit. Stirp Nov. 1: 84 (1784); Morton in J. Linn. Soc. 58: 242 (1962). Nom. cons.

- | | | |
|---|--|---|
| 1 | Mature calyx small, 3-5 mm. long:..... | 2 |
| | Mature calyx large, 5-20 mm. long: | 7 |
| 2 | Flowers in sessile fascicles:..... | 3 |
| | Flowers not fascicled; inflorescence a panicle with the lateral branches dichotomous or racemose: | 5 |
| 3 | Inflorescence a dense broad panicle with lateral branches about 15 cm. long and 1 cm. broad; mature calyx 3 mm. long, upper lip triangular, slightly broader and shorter than the other lanceolate teeth; corolla 6 mm. long; leaves broadly ovate, about 6 cm. long and 5-5 cm. broad, truncate, obtuse, deeply and coarsely crenate with a | |

- dense soft pubescence on both surfaces [1. cyaneus](#)
- Inflorescence racemose: **4**
- 4** Mature calyx 3-4 mm. long, upper lip ovate, acute, median and lower teeth slightly longer, narrowly lanceolate-acuminate; corolla up to 5 mm. long; inflorescence branched below, up to 15 cm. long, 1 cm. broad; pedicels 4-5 mm. long, unbranched; leaves broadly ovate-triangular, 4 cm. long and broad, truncate to slightly cordate, long-petiolate, coarsely crenate, pubescent on both surfaces; stems with a long soft pubescence [2. hallii](#)
- Mature calyx 5-6 mm. long; corolla up to 1 cm. long; inflorescence up to 35 cm. long and 2-2.5 cm. broad; pedicels 10 mm. long; leaves 2.5-5 cm. long and broad, truncate to abruptly cuneate, subglabrous to pubescent; stems glabrous to shortly pubescent [3. assurgens](#)
- 5** Lateral branches of inflorescence with first node dichotomous, racemose above; inflorescence lax, up to 7 cm. broad; mature calyx 5 mm. long, upper lip ovate, teeth slightly exceeding it; corolla about 1 cm. long; leaves ovate, twice as long as broad, 3.5-7 cm. long, finely crenate, rounded cuneate at base into a short petiole up to 1/2 as long as the lamina, subglabrous [4. peulhorum](#)
- Lateral branches of inflorescence racemose: **6**
- 6** Stems pubescent, slender; leaves lanceolate, acute at apex, gradually cuneate at base, sessile or shortly petiolate, 0.5-6 cm. long, a third as broad, crenate, thinly pubescent; mature calyx 3-4 mm. long, upper lip triangular-acute, teeth subulate, subequal; corolla 8 mm. long [5. tenuicaulis](#)
- Stems covered with narrowly lanceolate brown scales 4-5 mm. long, stout; leaves ovate to ovate-lanceolate, acute, more or less acuminate, decurrent into a long petiole, up to 16 cm. long and 8 cm. broad, usually less, coarsely crenate, subglabrous above, appressed-puberulous on veins beneath; inflorescence a fairly dense terminal panicle about 20 cm. long and 6 cm. broad; pedicels very slender, about 3 mm. long, each with a minute bract; mature calyx similar to No. 5; corolla about 1 cm. long [6. harrisii](#)
- 7** Leafless at time of flowering: **8**
- Flowering stems leafy: **9**
- 8** Large woody undershrub; inflorescence a very lax ample racemose panicle with ultimate branches 15-30 cm. long or smaller and on the older wood; mature calyx 2 cm. long, teeth very unequal, lower long and subulate; corolla 2 cm. long; leaves narrowly obovate-elliptic, acuminate, gradually cuneate into a short petiole, 15-25 cm. long and 6-10 cm. broad, pubescent on the veins, finely serrate [7. insignis](#)
- Perennial herb with edible tuberous roots; inflorescence a much-branched panicle; mature calyx 8 mm. long; corolla 1.5 cm. long; leaves oblong-lanceolate, sessile, rounded at apex, entire to somewhat crenate, setulose on the veins beneath [8. esculentus](#)
- 9** Leaves cordate, not decurrent on the long petiole: **10**
- Leaves cuneate to truncate, decurrent on the petiole: **11**
- 10** Flowers fascicled on the main axis or on a very short common peduncle; inflorescence little-branched; leaves ovate, acutely acuminate, up to 11 cm. long and 9 cm. broad, evenly and coarsely crenate, crenations broader than deep, glandular-punctate and with long white articulate hairs on the veins of both surfaces; mature calyx 8 mm. long, with a long white pubescence; upper lip ovate, acute, lower teeth lanceolate acuminate, exceeding upper lip, middle teeth similar but a little shorter; whole plant densely pubescent with long white jointed more or less glandular hairs [9. kamerunensis](#)
- Flowers in pedunculate cymes on the main axis; inflorescence a much-branched lax pyramidal panicle; branches of cymes slender, elongate, pubescent, straight; leaves ovate, acutely acuminate, up to 15 cm. long and 13 cm. broad, with very uneven double or treble rather small crenations, glandular-punctate, subglabrous or pubescent on the veins; mature calyx 9 mm. long, upper lip ovate acute, lower teeth lanceolate, long-acuminate, much exceeding upper lip, middle teeth similar but shorter, glabrous or minutely puberulous on the veins, gland-dotted; whole plant densely pubescent with short glandular hairs [10. glandulosus](#)
- 11** Plants producing fusiform, densely brown-villose bulbils in the axils of the inflorescence and branches; leaves shortly petiolate, elliptic-lanceolate, cuneate at base, long-acuminate, about 7 cm. long and 3 cm. broad, coarsely crenate, rusty-pubescent on veins beneath, subglabrous above; inflorescences axillary and terminal, flowers in sessile fascicles; pedicels about 7 mm. long, puberulous; mature calyx glandular, about 7 mm. long, upper lip ovate, acute, teeth narrowly lanceolate, subequal, 1/4 to 1/3 of the length of the tube; corolla 1 cm. long, pubescent [11. luteus](#)
- Plant without bulbils in axils of branches: **12**
- 12** Leaves sessile or nearly so, ovate to ovate-lanceolate, obtuse to subacute, serrate-crenate; stems angular; inflorescence of several whorls, dense in flower, elongate in fruit; calyx with ovate upper lip and narrowly lanceolate upcurved teeth, pubescent and gland-dotted, exceeding the pedicels: **13**
- Leaves distinctly petiolate: **14**
- 13** Corolla about 7 mm. long; mature calyx 7-8 mm. long; leaves broadly ovate, 2-4 cm. long, 1.5-3 cm. broad, shortly petiolate; plant subglabrous to pubescent with short woolly hairs [12. punctatus subsp. punctatus](#)
- Corolla about 1.5 cm. long; mature calyx 8-10 mm. long; leaves ovate-lanceolate, up to 7.5 cm. long and 4 cm. broad, sessile; whole plant with a dense long woolly indumentum [12a. punctatus subsp. lanatus](#)
- 14** Mature calyx 5-6 mm. long (for other characters see above) [3. assurgens](#)

Mature calyx 8-10 mm. long: **15**

- 15** Leaves nearly as long as broad, ovate-rotund, abruptly cuneate, coarsely crenate, thin, 4-6 cm. long, glabrous above, thinly pubescent on the veins beneath; petiole about as long as lamina; inflorescence racemose, lax, simple; mature calyx about 8 mm. long, lower teeth long-acuminate, exceeding the others; corolla 1-1.5 cm. long, blue [13. dissitiflorus](#)

Leaves at least twice as long as broad, ovate-lanceolate, up to 16 cm. long and 7 cm. broad, gradually cuneate and decurrent on a long petiole, crenate-serrate, thin, subglabrous except for a short, brown pubescence on the veins; inflorescence elongate, racemose, lax; pedicels shorter than the mature calyx; mature calyx 9-10 mm. long, upper lip orbicular, teeth long-acuminate; corolla 10-15 mm. long, yellow [14. decurrens](#)

1. *Plectranthus cyaneus* Gürke in Engl. Bot. Jahrb. 19: 208 (1894); F.T.A. 5: 409. *APD acc*

A densely pubescent bushy herb with woody stems and copious panicles of small violet flowers.

[Br.] Cam.: Jada, Adamawa (Nov.) Hepper 1362!

Also in [Uganda](#), [Kenya](#) and [Tanganyika](#).

2. *Plectranthus hallii* J. K. Morton in J. Linn. Soc. 58: 267 (1962). *APD acc*

An erect annual branched delicate herb up to about 1 ft. high with loose spikes of very pale blue flowers; [under trees in rocky savanna](#).

[Ghana](#): Gambaga Scarp (fl. Sept., fr. Nov.) Hall 790! Morton A2749! A3791!

3. *Plectranthus assurgens* (Bak.) J. K. Morton l.c. 267(1962). *APD acc*

Coleus assurgens Bak. in F.T.A. 5: 428 (1900).

A much-branched, rather slender herb with long straggling stems thin subglabrous leaves and many-flowered whorls of bluish-purple flowers.

[S. Nig.](#): Mt. Koloishe, 5,000 ft., Obudu Div. (Dec.) Keay & Savory FHI 25067! [Br.] Cam.: path to Mann's Spring, 3,800 ft., Cam. Mt. (Dec.) Adams 1671! Morton K835! L. Oku, Bamenda (Jan.) Keay & Lightbody FHI 28508! [F. Po.](#): (Dec.) Monad 10427!

Also in [E. Africa](#).

4. *Plectranthus peulhorum* (A. Chev.) J. K. Morton l.c. 268 (1962). *APD acc*

Coleus peulhorum A. Chev. in Journ. de Bot. 12: 123 (1909); Bot. 519.

An erect annual herb 1-1 1/2 ft. high, with a rather slender, branched, thinly puberulous stem and pale blue flowers 1/3 in. long.

[Guin.](#): Fouta Djallon (Oct.) Chev. 18424! 18566! 18895! [N. Nig.](#): Jos Plateau (Sept.) Lely P741! Batten-Poole 167! [Br.] Cam.: Bafut-Ngemba F.R., 5,000-6,500 ft., Bamenda (Sept.-Nov.) Lightbody FHI 26263! Savory UCI 379!

5. *Plectranthus tenuicaulis* (Hook. f.) J. K. Morton l.c. 268 (1962). *APD acc*

Coleus tenuicaulis Hook. f. in J. Linn. Soc. 7: 211 (1864); F.T.A. 5: 443.

Plectranthus minimus Gürke (1894)-F.T.A. 5: 403; F.W.T.A., ed. 1, 2: 289.

A usually small erect, branched, slender pubescent herb 2-36 in. high with lax panicles of small blue flowers.

[Br.] Cam.: Cam. Mt., 6,000-7,500 ft. (fl. Sept-Dec., fr. Nov.-Jan.) Mann 1939! Preuss 1019! Morton K529! K716! K741! K846! Bamenda Dist. (fr. Dec.) Boughey GC 10585!

6 *Plectranthus harrisii* J. K. Morton l.c. 267, t. 5 (1962). *APD acc*

A stout, erect unbranched herb to 8 ft. high with perennial rootstock and narrow panicles of yellow flowers heavily suffused with purple; [in hill savanna and woodland at the forest edge](#).

[Ghana](#): Togo Plateau, 2,000 ft. (fl. Dec.-Jan.) Morton A3528! A3830! Adams 1842!

7. *Plectranthus insignis* Hook. f. in J. Linn. Soc. 7: 210 (1864); F.T.A. 5: 404. *APD acc*

A large shrub 10-15 ft. high, with soft wood and inflorescences in a very loose panicle or raceme; flowers yellow suffused with purple; usually leafless at time of flowering; **in montane forest**.

[Br.] Cam.: Cam. Mt., 6,000-7,000 ft. (Jan.-Dec.) Preuss 991! Dunlap 4! 51! Mann 1257! Morton K497! K697! Bafut-Ngemba F.R., Bamenda (Feb.) Hepper 2162!

8. **Plectranthus esculentus** *N. E. Br.* in Kew Bull. 1894: 12. *APD acc*

Coleus esculentus (*N. E. Br.*) *G. Tayl.* (1931).

C. dazo *A. Chev.* (1904)-Chev. & Perrot. in Vég. Util. Afr. Trop. Fr. 1: 126 (1905); F.W.T.A., ed. 1, 2: 292.

C. langouassiensis *A. Chev.* (1905)-Chev. Bot. 519.

Perennial with herbaceous erect stems, rather coarsely pilose with whitish hairs; flowers yellow 1/2-2/3 in. long; root elongated-tuberos; **often cultivated**.

Mali: Tangaye to Lozitenga, Mossi (July) Chev. 24579. **N. Nig.:** Bukuru, Jos (Jan.) Keay & Russell FHI 28448! [Br.]

Cam.: Kumbo (Feb.) Hepper 1975!

Also in **Angola**, **Ubangi-Shari**, **Congo** and extending to **Angola** and Natal.

9. **Plectranthus kamerunensis** *Gürke* in Engl. Bot. Jahrb. 19: 202 (1894); F.T.A. 5: 408; F.W.T.A., ed. 1, 2: 289. *APD acc*

Plectranthus mannii *Bak.* in F.T.A. 5: 408 (1900); F.W.T.A., ed. 1, 2: 289.

A straggling woolly herb with erect flowering branches some 3 ft. in height; flowers violet.

S. Nig.: Ikwette Plateau, 5,200 ft., Obudu Div. (Dec.) Keay & Savory FHI 25253! [Br.] **Cam.:** Cam. Mt. 3,000-4,000 ft. (Nov., Dec.) Mann 1947! Migeod 65! Morton K500! 11. **Plectranthus luteus** *Gürke* in Engl. Bot. Jahrb. 28: 468(1900); F.T.A. 5: 524.

APD: *Synonym of Plectranthus melleri Baker*

Coleus luteus (*Gürke*) *Staner* (1934)

Coleus entebbensis *S. Moore* (1906).

A branched woody herb, about 3 ft. high, with orange-yellow flowers 1 cm. long.

Lib.: Mt. Wologwisi, 4,500 ft., Pandonai (Dec.) Bequaert 105!

Also in **Congo** and **E. Africa**.

12. **Plectranthus punctatus** *L'Hérit. subsp. punctatus* -Stirp. Nov. 87, t. 42 (1784). *APD acc*

Coleus glandulosus *Hook. f.* in J. Linn. Soc. 7: 211 (1864); F.T.A. 5: 425; F.W.T.A., ed. 1, 2: 292.

An erect, glandular-pubescent herb about 1 ft. high; flowers bluish-purple, small; [in montane grassland](#).

[Br.] Cam.: Cam. Mt., 2,700-7,000 ft. (Nov., Dec.) Mann 1301! 1988! Mann's Spring, 7,500 ft. (Apr., Dec.) Boughey GC 10691! Morton GC 6796! K594! F. Po: summit grassland (July) Boughey GC 10968!

12a. *Plectranthus punctatus* subsp. *lanatus* J. K. Morton in J. Linn. Soc. 58: 268, t. 14 (1962). *APD acc*

Larger than the type subspecies, with large showy, royal-blue flowers.

[Br.] Cam.: Bamenda Prov.: Bambui, 6,300 ft. (Dec.) Adams GC 11322! Bamenda, 6,000ft (June) Maitland 1724! Ndu, Banso (Sept.) Savory UCI 386! ridge N. of L. Oku (Jan.) Keay & Lightbody FHI 28464!

[Similar to the E. African *Coleus edulis* Vatke which has tuberous roots and is subglabrous.]

13. *Plectranthus dissitiflorus* (Gürke) J. K. Morton l.c. 267 (1962). *APD acc*

Coleus dissitiflorus Gürke in Engl. Bot. Jahrb 19: 217 (1894); F.T.A. 5: 444; F.W.T.A., ed. 1, 2: 292.

A perennial herb with glandular-pubescent stems up to 3 or 4 ft, long and blue-purple flowers 3/4 in. long.

[Br.] Cam.: Buea to Bimbia (fl. & fr. Oct.) Preuss 1055!

14. *Plectranthus decurrens* (Gürke) J. K. Morton l.c. 267 (1962). *APD acc*

Coleus decurrens Gürke l.c. 215 (1894); F.T.A. 5: 427; F.W.T.A., ed. 1, 2: 292.

C. elatus Bak. in F.T.A. 5: 427 (1900).

A herb up to 6 ft. high, with pubescent stems and large leaves: flowers either red or yellowish, about 1/2 in. long.

S. Nig.: Oban Talbot 369! [Br.] Cam.: near Buea, 3,000 ft. (fl. & fr. Sept.) Preuss 948! Northern Korup F.R., Kumba (July) Olorunfemi FHI 30688! F. Po: (Dec.) Mann 584!

Extends to Gabon.

15. HOMALOCHEILOS

J. K. Morton in J. Linn. Soc. 58: 268 (1962).

- 1 Inflorescence a panicle of many-flowered dichotomous cymes borne in the axils of leafy bracts; stems straggling, square, pubescent; leaves ovate, rounded to cuneate at base, acute at apex, up to 7 cm. long and 4 cm. broad, crenate, thinly pubescent and dark-green above, densely pubescent, gland-dotted and pale-green beneath, distinctly petiolate; calyx densely pubescent, 4 mm. long, tube declinate, ventricose, teeth subequal, short, triangular; corolla 5 mm. long, upper lip very small, recurved, lower lip small, almost flat, deflexed in flower [ramosissimus](#)

***Homalocheilos ramosissimus* (Hook. f.) J. K. Morton** l.c. 268, t. 6 (1962).

*APD: Synonym of *Isodon ramosissimus* (Hook. f.) Codd*

Plectranthus ramosissimus Hook. f. in J. Linn. Soc. 6: 17 (1862); F.T.A. 5: 418; F.W.T.A., ed. 1, 2: 289.

Coleus ramosissimus (Hook. f.) Roberty in Bull. I.F.A.N. 16, 1: 330 (1954), partly.

A straggling to erect herb, with sharply angled pilose stems up to 12 ft. long and copious glandular-pubescent inflorescences of small white flowers with mauve marks in the throat of the corolla.

S. L.: Loma Mt. Jaeger 1628! S. Nig.: Koloishe Mt., 5,000 ft., Obudu Div. (Dec.) Keay & Savory FHI 25074! [Br.] Cam.: Cam. Mt., 7,000-7,500 ft. (Jan., Apr.) Dunlap 213! Mann 1320! Morton GC 7099! Bamenda, 7,000 ft. (Jan., Mar.) Morton K138! Keay & Lightbody FHI 28367! Mambila Plateau (Jan.) Hepper 1675! Vogel Peak, Adamawa (Nov.) Hepper 1551! F. Po: (Mar., Dec.) Monod 10430! Guinea 1266! 1979!

Also on the [Sudan-Uganda border](#) and in [S. Rhodesia](#).

16. LEOCUS

A. Chev. in Journ. de Bot., sér. 2, 2: 125 (1909), incl. Briquetastrum Robyns & Lebrun in Ann. Soc. Sci. Brux., sér. B, 49, Mém. 102 (1929).

- 1 Erect more or less unbranched herb with quadrangular pubescent stems bearing a single terminal inflorescence, leafless above the middle; leaves lyrate-oblongate, crenate above and entire below the middle, acute, more or less auricled on the stem, about 10 cm. long, 3-4 cm. broad, densely crispate-pubescent beneath especially on the veins, setose above; inflorescence dense, cylindrical about 6 cm. long and 1-7 cm. broad, bracts small, inconspicuous, lanceolate, caducous; calyx purple, pubescent, prominently veined, 6 mm. long in fruit, tube bulbous, rotund, equalling the 4 lanceolate shorter teeth, upper tooth larger, narrowly lanceolate, acuminate; corolla pubescent, 8 mm. long [1. lyratus](#)
- Shrubby plants with woody stems; leaves lanceolate to ovate, distinctly petiolate; inflorescences several to numerous, terminal on the branches, cylindrical with conspicuous ovate to rotund apiculate or acuminate bracts at least when in bud, bracts often caducous in flower: [2](#)
- 2 Leaves oblong-lanceolate slightly cuneate at base, about 15 cm. long and 4 cm. broad, undulate-crenate, puberulous above, softly tomentellous and closely reticulate beneath; petiole 1-2 cm. long; stems grooved, softly tomentellous; inflorescence of 3 long-pedunculate cylindrical spikes 6-10 cm. long, 1-5-2-5 cm. broad, bracteate in bud; calyx campanulate, with the adaxial lip large, oblong-elliptic, forming a hood over the other 4 small ovate teeth, nervose; corolla 6 mm. long, tomentellous [2. africanus](#)
- Leaves ovate: [3](#)
- 3 Bracts persistent, membranous, 1-2 cm. diam., rotund, apiculate; calyx 6 mm. long, teeth narrowly lanceolate, acuminate, shortly scabrid-pubescent, stems stout woody, terete, tomentellous when young; leaves ovate, serrate, cuneate and petiolate at base, obtuse at apex, about 8 cm. long and 4-5 cm. broad, thinly pubescent above, tomentellous and gland-dotted beneath; plant leafless when in flower [3. membranaceus](#)
- Bracts caducous at time of flowering, not membranous, ovate-lanceolate, acuminate; calyx prominently veined, about 4-5 mm. long in fruit, tube longer than broad, exceeding the long-lanceolate upper tooth, other teeth short and triangular; corolla pubescent; leaves ovate to ovate-triangular acutely acuminate or obtuse, rounded at base, distinctly petiolate, about 8 cm. long and 5 cm. broad, coarsely crenate, finely tomentellous on both surfaces, whitish beneath: [4](#)
- 4 Corolla 7-10 mm. long; calyx rather thinly and shortly pubescent [4. caillei](#)
- Corolla about 15 mm. long; calyx villose-tomentose [5. pobeguini](#)

1. Leocus lyratus **A. Chev.** in Journ. de Bot., sér. 2, 2: 126 (1909); Chev. Bot. 520.

APD: *Synonym of Plectranthus betonicifolius Baker*

Coleus lyratus (**A. Chev.**) **Roberty** in Bull. I.F.A.N. 16, 1: 330 (1954).

An erect perennial herb, about 3 ft. high, with dense terminal spike-like inflorescences of bluish-purple flowers.

Guin.: Dalaba-Diaguissa Plateau, 3,000-4,000 ft. (Sept.-Oct.) Chev. 18824! Tinka Mt., 4,000 ft., Dalaba (Sept.) Chev. **S. L.:** Loma Mt. (Sept.) Jaeger 1879! Warantamoa (Oct.) Small 348! Musaia (Sept.) Small 245! Falaba (Sept.) Deighton 5168!

Also in **N. & S. Rhodesia**.

2. Leocus africanus (**Bak. ex Sc. Elliot**) **J. K. Morton** in J. Linn. Soc. 58: 270 (1962).

APD: *Synonym of Plectranthus africanus (Baker ex Scott-Elliot) A.J. Paton*

Anisochilus africanus **Bak. ex Sc. Elliot** in J. Linn. Soc. 30: 94 (1 Feb. 1894); F.T.A. 5: 446; Chev. Bot. 521; F.W.T.A., ed. 1, 2: 292.

A. engleri **Briq.** in Engl. Bot. Jahrb. 19: 190 (13 Apr. 1894).

Geniosporum congoense **Gürke** (1900), name only.

Briquetastrum africanum (**Bak. ex Sc. Elliot**) **Robyns and Lebrun** (1929).

Coleus africanus (**Bak. ex Sc. Elliot**) **Roberty** l.c. (1954).

A woody perennial herb of **savanna swamps**, 4-5 ft. or more in height, dull ochrey-pubescent, with pale blue flowers arranged in dense cylindrical spikes.

Guin.: Télimélé (Apr.) Pitot T51-873! Dalaba fide Roberty. Faranna (Jan.) Chev. 20411! 20442! **S. L.:** Lomaburn (Feb.) Sc. Elliot 5033! near Koinadugu (Dec.) Glanville 457! Kiridoy to Kamaro (Jan.) 4. *Leocus caillei* (A. Chev. ex Hutch. & Dalz.) J. K. Morton l.c. 270 (1962).

APD: *Synonym of Plectranthus caillei* (A. Chev. ex Hutch. & Dalziel) B. J. Pollard

Coleus caillei A. Chev. ex Hutch. & Dalz. F.W.T.A., ed. 1, 2: 292 (1931); Chev. Bot. 518, name only.

A stout erect undershrub, 2-3 ft. high with dense oblong spikes of bright blue flowers.

Guin.: Longuery (Dec.) Caille in Hb. Chev. 14864! S. L.: Bintumane, 5,000 ft. (Jan.) Glanville 477! N. Nig.: Naraguta (Oct.) Hepper 1170! Sara Hills, Bauchi Div. (Oct.) Hepper 1128! Kadun Peak, Pankshin Div. (Oct.) Wimbush 17! [Br.] Cam.: Vogel Peak, Adamawa (Nov.) Hepper 1553!

5. *Leocus pobeguinii* (Hutch. & Dalz.) J. K. Morton l.c. 270 (1962). APD acc

Coleus pobeguinii Hutch. & Dalz. F.W.T.A., ed. 1, 2: 292 (1931).

A stout undershrub with woody stems 1/4 in. thick and 3-6 ft. high; flowers rich bluish-purple in dense oblong heads about 1 in. long, forming a stiff, branched panicle.

Guin.: Kouroussa (Oct.) Pobéguin 556! 996! Mali to Kédougou, Fouta Djallon (fr. June) Adam 14443! S. L.: Glanville 385!

17. SOLENOSTEMON

APD: *Synonym of Plectranthus L'Hér.*

Thonning-F.T.A. 5: 420; Morton in J. Linn. Soc. 58: 251 (1962).

- 1 Median teeth of calyx deltoid, not acuminate;2
Median teeth of calyx lanceolate, acute or acuminate:4
- 2 Inflorescence a terminal umbellate cyme of about 4-6 short racemes 3-4 cm. long; calyx 6 mm. long, upper lip ovate-rotund, decurrent, lower lip exceeding upper with 2 very long mucronate curved teeth, median lobes lanceolate blunt short; stems creeping, pubescent; leaves long-petiolate, broadly ovate, 2-3 cm. long and broad, obtuse, cuneate, coarsely crenate, thin, setose-pubescent [1. repens](#)
Inflorescence pseudo-racemose, paniculate or spicate, not umbellate:3
- 3 Plant perennial producing numerous underground edible tubers 1-6 cm. long; inflorescence narrow, about 1 cm. broad, elongate and lax; mature calyx 2-3 mm. long, upper lip ovate, lower lip oblong with 2 small teeth, median teeth very small and triangular; corolla 4-8 mm. long; leaves thick, half-succulent, ovate, up to 6 cm. long and 4 cm. broad, shallowly crenate, cuneate into a petiole, shortly pubescent, gland-dotted beneath [2. rotundifolius](#)
Plant annual not producing underground tubers, roots fibrous; erect or creeping herb, subglabrous to long-pubescent; inflorescence lax, interrupted, elongate, up to 30 cm. long in fruit and 1-2.5 cm. broad; corolla 7-15 mm. long; mature calyx 3-6 mm. long, upper lip broadly ovate, lower lip strap-shaped with 2 sharp teeth, exceeding upper, median lobes deltoid-rotund; leaves thin to somewhat fleshy, linear-lanceolate to ovate,

- truncate to cuneate, 1.5-8 cm. long and 1-5 cm. broad, crenate, long-petiolate [3. latifolius](#)
- 4 Pedicels much exceeding mature calyx, often branched: 5
- Pedicels about equalling the mature calyx: 8
- 5 Lower surface of leaves obscured by a dense even felt of hairs, upper surface with dense tufts of hairs obscuring all but the veins; leaves broadly triangular-ovate, 3-4 cm. long, cuneate at base; inflorescence elongate, lax, simple, about 30 cm. long, few-flowered, cymes stalked, distant; mature calyx 4 mm. long, lower lip ovate, emarginate; corolla 10-14 mm. long [4. koualensis](#)
- Lower surface of leaves pubescent to glabrous, not obscured by hairs: 6
- 6 Leaves lanceolate, somewhat fleshy, 2-8 cm. long, 1/2-3 cm. broad, acute, gradually cuneate at base, almost sessile, dentate except towards base, thinly puberulous above and on the veins beneath; annual erect bushy herb; inflorescence lax, 1-15 cm. long, 3-5 cm. broad; mature calyx globose, about 5 mm. diam., tube very short, upper lip very broadly ovate, lower emarginate; corolla about 7 mm. long [5. chevalieri](#)
- Leaves ovate; perennial herbs: 7
- 7 Small herb 10-30 cm. high with decumbent stem bases and thick fleshy leaves; leaves 1-2.5 cm. long, 7-15 mm. broad, triangular, bluntly acute, coarsely crenate, with a broad cuneate base and a short petiole, gland-dotted and pubescent on the veins beneath, thinly pubescent above; inflorescence 5-15 cm. long, rather dense, fascicles of flowers sessile, pedicels simple; mature calyx 3-5 mm. long, pubescent, both lips rotund, upper shortly apiculate; corolla 1-1.5 cm. long [6. decumbens](#)
- Large climbing or bushy herbs; leaves thin to fleshy, completely subglabrous to densely pubescent on the veins beneath, ovate, 4-15 cm. long, crenate, acutely acuminate, long-petiolate, cuneate at base; inflorescence rather dense, copiously flowered, 3-4 cm. broad and up to 25 cm. or more long in fruit; calyx 4-5 mm. long, puberulous, upper lip ovate, lower slightly emarginate; corolla 1-5 cm. long [7. manni](#)
- 8 Leaves linear, about 8 cm. long and 5 mm. broad, sessile, dentate, scabrid above, appressed-pubescent on the veins beneath and gland-dotted; stems wiry, 4-angled, thinly appressed-pubescent; inflorescence simple, elongate, lax; bracts ovate, acuminate, about 3 mm. long, caducous; pedicels puberulous, shorter than the mature calyx; mature calyx inflated, thin and papery, about 5 mm. long and 3-7 mm. broad, thinly puberulous and gland-dotted; corolla 6-8 mm. long [8. linearifolius](#)
- Leaves lanceolate, ovate, or rotund: 9
- 9 Leaves rugose, densely pubescent, especially on the veins beneath, thick; perennials; stems rounded quadrangular, tomentose: 10
- Leaves not rugose: 11
- 10 Erect bushy woody herb 1 m. or more high; leaves ovate, acute, subsessile; inflorescence dense, long and spicate, subcontiguous even in fruit, 15-40 cm. long, 1-5 cm. broad, bracts ovate-acuminate about 5 mm. long, reflexed in flower, persistent until fruit is mature; pedicels often branched at base; mature calyx 4-4.5 mm. long, pubescent and gland-dotted, lips divergent, upper ovate slightly apiculate, lower oblong emarginate; corolla 10-12 mm. long, lower lobe 5 mm. broad [9. graniticola](#)
- Stems decumbent forming a mat over rocks; flowering shoots erect 30-40 cm. high; leaves ovate to ovate-rotund, obtuse, about 3 cm. long and 2 cm. broad, petiolate; inflorescence whitish-pubescent when young, dense in flower but elongate and interrupted in fruit, 10-30 cm. long, 1 cm. broad, bracts slightly broader than above and caducous as the flower opens; pedicels simple; mature calyx as above but 3-3.5 mm. long; corolla about 7 mm. long, lower lobe 3 mm. broad [11c. monostachyus subsp. marrubiifolius](#)
- 11 Small creeping herb with decumbent branched stems pubescent on the angles; leaves ovate-triangular, acutely acuminate, 1.5-3 cm. long, 1-2.5 cm. broad, coarsely crenate, with purple blotch in centre, pubescent on both surfaces, cuneate into a petiole almost equal to the lamina; inflorescence fairly dense, elongate, 10-25 cm. long, up to 2 cm. broad; mature calyx 3 mm. long, reticulate, lower lip oblong-rotund, median teeth small and acute, upper lip exceeding lower, ovate; corolla about 7 mm. long. [10. minor](#)
- More or less erect, sometimes bushy herbs, not creeping: 12
- 12 Inflorescence dense in flower, subcontiguous in fruit, with large persistent broadly ovate-acuminate bracts which are reflexed in flower, about 1 cm. long and broad or larger; corolla 10-15 mm. long, lower lip about 9 mm. long and 3 mm. broad; mature calyx 6 mm. long; stems stout woody, erect, shortly crispate pubescent; leaves coriaceous, ovate 8-12 cm. long, 4-5-7 cm. broad, cuneate into a short petiole 1-2 cm. long, finely and thinly appressed-puberulous above, densely and shortly crispate-pubescent on the veins beneath [11b. monostachyus subsp. lateriticola](#)
- Inflorescence rather dense in flower but elongate and interrupted in fruit, bracts about 5 mm. long, lanceolate, usually caducous in flower; corolla 5-10 mm. long, lower lip up to 6 mm. long and 2 mm. broad; mature calyx 4-5 mm. long; stems slender or stout and fleshy, erect and bushy or decumbent at base; leaves thin to somewhat succulent, petiole exceeding half length of lamina: 13
- 13 Annual herb with rather fleshy acutely angled stems; leaves broadly ovate, usually obtuse, sharply cuneate and long-petiolate at base, up to 10 cm. long and 8.5 cm. broad, thin, coarsely crenate, shortly pubescent above and on the veins beneath; inflorescence 5-40 cm. long, 1.5-1.7 cm. broad in fruit; mature calyx 4-5 mm. long, pubescent; corolla about 5 mm. long [11. monostachyus subsp. monostachyus](#)

Perennial herb with small tuberous stem-base; leaves lanceolate to ovate-lanceolate up to 9 cm. long and 5 cm. broad, bluntly acute, abruptly cuneate into petiole as long as the lamina, somewhat fleshy, subglabrous apart from a minute pubescence on the veins; inflorescence very elongate and lax, 20-50 cm. long, 1-2 cm. broad, whorls distant; corolla about 9 mm. long *Ila. monostachyus subsp. perennis*

1. *Solenostemon repens* (Gürke) J. K. Morton in J. Linn. Soc. 58: 272 (1962).

APD: *Synonym of Plectranthus epilithicus B. J. Pollard*

Coleus repens Gürke in Engl. Bot. Jahrb. 19: 213 (1894); F.T.A. 5: 439; F.W.T.A., ed. 1, 2: 292.

C. carnosus A. Chev. in Journ. de Bot., sér. 2, 2: 125 (1909), incl. var. *lamiifolius* A. Chev. Bot. 518.

A small creeping herb a few inches high, with lax cymes of greenish-white flowers; **in dense wet forest particularly on rocks and decaying tree-trunks.**

Guin.: Fassakoidou (Feb.) Chev. 20806! Nzo Mts. (Mar.) Chev. 21077! **S. L.:** Baoma (Dec.) Deighton 8806! **Lib.:** Ganta to Sanokwele (Sept.) Baldwin 13262! **Iv. Widespread in tropical Africa.

Very variable and probably containing several taxa.

4. *Solenostemon koualensis* (A. Chev. ex Hutch. & Dalz.) J. K. Morton l.c. 270 (1962).

APD: Synonym of Plectranthus koualensis (A. Chev. ex Hutch. & Dalziel) B. J. Pollard & A.J. Paton

Coleus koualensis A. Chev. Bot. ex Hutch. & Dalz. F.W.T.A., ed. 1, 2: 291 (1931); Chev. Bot. 519, name only.

A slender erect plant with woody stems 2-3 ft. high and blue flowers.

Iv. C.: Mt. Dourou, summit 3,400 ft., Upper Sassandra (May) Fleury in Hb. Chev. 21715!

5. Solenostemon chevalieri Briq. in Mém. Soc. Bot. Fr. 2, 8: 286 (1917); Chev. Bot. 517.

APD: Synonym of Plectranthus chevalieri (Briq.) B. J. Pollard & A.J. Paton

Coleus nigericus A. Chev. Bot. 519, name only.

An erect, branched annual herb about 1 ft. high with broad inflorescences of small pale violet flowers.

Mali: Niokolo-Koba (fr. Oct.) Adam 15608! Koulikoro (Oct.) Chev. 2779!

6. Solenostemon decumbens (Hook. f.) Bak. in F.T.A. 5: 421 (1900).

APD: Synonym of Plectranthus decumbens Hook. f.

Plectranthus decumbens Hook. f. (1864).

A small aromatic herb with ascending flowering shoots and decumbent stems: flowers pale blue.

[Br.] Cam.: Cam. Mt., 7,000-8,000 ft. (Nov.-Jan.) Johnston 79! Maitland 923! Mann 2002! Boughey GC 10624! Morton K740! K583! Bamenda, in bamboo thicket, 7,500 ft. (fr. Apr.) Morton K218!

7. Solenostemon mannii (Hook. f.) Bak. in F.T.A. 5: 422 (1900).

APD: Synonym of Plectranthus occidentalis B. J. Pollard

Coleus mannii Hook. f. (1864).

Solenostemon cymosus Bak. in F.T.A. 5: 422 (1900); F.W.T.A., ed. 1, 2: 290.

A herbaceous or somewhat woody perennial **growing in wet forest or amongst scrub at higher altitudes**, with climbing or erect and bushy square stems and long, rather dense racemes of rich bluish-purple flowers.

S. L.: Linbaia, near Falaba (Oct.) Small 429! **Lib.:** Sanokwele (Sept.) Baldwin 9517! **Ghana:** Begoro (Nov.) Morton A45! Kibbi (Dec.) Morton GC 8217! **S. Bamenda, 3,600-6,500 ft. (fl. Dec., fr. Apr.) Boughey GC 1126! Morton K240! Keay & Lightbody FHI 28364! **F. Po:** Boughey!

[The erect bushy forms represented by Morton K240 and Keay & Lightbody FHI 28364 may be distinct.]

8. Solenostemon linearifolius J. K. Morton in J. Linn. Soc. 58: 271, photo. 2 (1962).

APD: Synonym of Plectranthus linearifolius (J. K. Morton) B. J. Pollard & A.J. Paton

An erect annual herb about 1 ft. high with whorls of violet flowers in lax erect racemes.

Guin.: Diendiou (Mar.) Pobéguin 1920!

9. Solenostemon graniticola A. Chev. in Journ. de Bot., sér. 2, 2: 121 (1909); Chev. Bot. 517.

APD: Synonym of Plectranthus monostachyus subsp. marrubifolius (Brenan) B. J. Pollard

APD: Synonym of Plectranthus saxicola B. J. Pollard & A.J. Paton

Solenostemon monostachyus var. **graniticola** (A. Chev.) Brenan in Kew Bull. 5: 231 (1950).

A densely whitish pubescent rather fleshy shrub about 3 ft. high with showy dense inflorescences of large purple flowers; **on granite rocks**.

Lib.: Zwedru (Aug.) Baldwin 7068! **Iv. C.:** Mt. Nienokue (July) Chev. 19469! Issa, Daloa to Abidjan (Dec.) Boughey GC 13598! GC 14708!

10. *Solenostemon minor* J. K. Morton l.c. 271 (1962).

*APD: Synonym of *Plectranthus decumbens* Hook. f.*

A creeping herb, rooting at the nodes and tuberous at the base; flowering stems 6-18 in. high; flowers purple; **on wet granite rocks**.

N. Nig.: W. Kagoro Hills, 3,700 ft., Jos Plateau (Aug.) Killick 15! **S. Nig.:** Mt. Koloishe, 5,500 ft., Obudu Div. (Dec.) Keay & Savory FHI 25086!

11. *Solenostemon monostachyus* (P. Beauv.) Briq. subsp. *monostachyus*-in E. & P. Pflanzenfam. 5, 3A: 359 (1897); Chev. Bot. 517; Morton in Bull. Soc. Bot. Fr. 104: 164 (1957) (fig. citations reversed).

*APD: Synonym of *Plectranthus monostachyus* (P. Beauv.) B. J. Pollard subsp. *monostachyus**

Ocimum? monostachyum P. Beauv. Fl. Oware 2: 60, t. 95, fig. 1 (1818).

Solenostemon ocymoides Schum. & Thonn. (1827)-F.T.A. 5: 420; Chev. Bot. 518; F.W.T.A., ed. 1, 2: 290.

Solenostemon ocymoides var. **monostachyus** (P. Beauv.) Bak. in F.T.A. 5: 421 (1900).

An erect, branched, pubescent, annual weedy herb with long rather dense inflorescences of small, pale violet flowers; frequently with a purple blotch in the centre of the leaves. Diploid.

Also in *Angola* and *E. Africa*.

21. HYPTIS

Jacq.-F.T.A. 5: 447; Epling in Kew Bull. 1936: 278. Nom. cons.

- 1 Inflorescence terminal:2
 Inflorescence of axillary heads of few-flowered cymes:3
- 2 Inflorescence a dense cylindrical or ovoid-cylindrical spike up to 9 cm. long; bracts linear-filiform, ciliate; mature calyx 5 mm. long, strongly 10-ribbed, pubescent, but lacking conspicuous tufts of white hairs between the subulate teeth; leaves lanceolate, acute, up to 8 cm. long and 3 cm. broad, closely gland-dotted beneath .[1. spicigera](#)
 Inflorescence much-branched, not leafy, flowers secund, numerous; mature calyx 3 mm. long, 10-ribbed, pubescent, with conspicuous tufts of white hairs between the subulate teeth; leaves ovate-elliptic, up to 8 cm. long and 4 cm. broad, toothed, softly tomentose, long-petiolate [2. pectinata](#)
- 3 Inflorescence lax, consisting of few-flowered axillary cymes; calyx broadly campanulate, strongly 10-ribbed, accrescent in fruit, about 11 mm. long when mature, teeth subequal, subulate; leaves broadly ovate, rounded at base, 4-5 cm. long, up to 4 cm. broad, pubescent above, white-tomentose especially on the veins beneath, very long-petiolate [3. suaveolens](#)
 Inflorescence dense, globose, many-flowered; calyx narrow and tubular:4
- 4 Mature calyx 7 mm. long, tube truncate at apex, teeth linear-filiform; leaves ovate-lanceolate to ovate, cuneate at base, up to 5 cm. long and 2 cm. broad, crenate, densely gland-dotted beneath and setose on the nerves, petiolate [4. atrorubens](#)
 Mature calyx 4-5 mm. long, tube not truncate, the subulate-triangular teeth with a V-shaped sinus between; leaves lanceolate, cuneate at base, up to 11 cm. long and 3-5 cm. broad, but usually smaller, serrate, subglabrous, gland-dotted beneath, shortly petiolate [5. lanceolata](#)

1. **Hyptis spicigera** Lam. Encycl. Méth. Bot. 3: 185 (1789); F.T.A. 5: 448; Chev. Bot. 523; Epling in Kew Bull. 1936: 278. *APD acc*

A tall, erect, aromatic, rather scabrid herb; flowers very small, corolla white with mauve marks on the lip; a weed of roadsides and cultivated land, often occurring in damp places.

Sen.: Perrottet 676! **Gam.:** Basse and Kudang (Mar.) Todd 15! Genieri (Feb.) Fox 47! **Mali:** Garango, Upper Volta (Oct.) Grost! Koulikoro (Oct.) Chev. 2782! Kara (Oct.) Davey 188! **Port. G.:** Bafata (Nov.) Esp. Santo 2967! **Guin.:** Bordo, Kankan (Apr.) Adam 12132! **S. L.:** Musaia (Dec.) Deighton 4451! **Ghana:** Gonja (Dec.) Morton GC 25029! Yendi (Dec.) Adams & Akpabla 4079! **Niger:** Niamey (Oct.) Hagerup 548! **N. Nig.:** Kontagora (Nov.) Dalz. 136! [**Br.**] **Cam.:** Jada, Adamawa (Nov.) Hepper 1223!

Perhaps a native of Brazil, but now widespread in Africa and Asia.

2. **Hyptis pectinata** (Linn.) Poit. in Ann. Mus. Paris 7: 474, t. 30 (1806); F.T.A. 5: 448; Chev. Bot. 522; Epling l.e. *APD acc*

Nepeta pectinata Linn. (1759).

Bystropogon coarctatus Schum. & Thonn. (1827).

A tall, erect, aromatic, woody herb with a dense, much-branched inflorescence of very small flowers; corolla pale yellowish-green with mauve marks on the lip.

Guin.: Niguelandé (Mar.) Adam 11631! **S. L.:** Kukuna (Jan.) Sc. Elliot 4667! **Iv. C.:** Toumodi (Dec.) Boughey GC 14423! **Ghana:** Gonja, N.T. (Dec.) Morton GC 9943! Weija, Accra (Nov.) Morton A996! Butre, Western Region (Mar.) Morton A435! Kete Krachi (Apr.) Morton GC 9127! **Togo Rep.:** Lomé Warnecke 16! **Dah.:** Zagnanado (Feb.) Chev. 22983. Lahama (Feb.) Chev. 23257. **N. Nig.:** Naraguta (Aug.) Lely 551! **S. Nig.:** Lagos Dawodu 207! [**Br.**] **Cam.:** Preuss 1100!

A weed native in tropical America, now in tropical Africa, Madagascar and Asia.

3. **Hyptis suaveolens** Poit. l.c. 472, t. 29 (1806); F.T.A. 5: 449; Chev. Bot. 523; Epling l.c. *APD acc*

A stout bushy, strongly aromatic, pubescent herb with large 1/4 in. blue flowers; a weed of roadside and cultivated land.

Sen.: Farmar 156! **Gam.:** (July) Brooks 22! **Port. G.:** Bissau, Pelum (Jan.) Esp. Santo 1614! **Guin.:** Conakry Chev. 12064! Debeaux 142! **S. L.:** Mafwe (Apr.) Deighton 1691! Freetown (Sept.) Po.:** (June) Barter! (Dec.) Monod 10489!

Apparently native in our area; widespread in tropical Africa and America.

22. SATUREJA

Linn. Sp. Pl. 2: 567 (1753); Brenan in Mem. N.Y. Bot. Gard. 9: 45 (1954).

- 1 Older leaves 4-10 mm. long, ovate, rounded at base with several ascending nerves, scabrid above, dotted with large glands beneath, subsessile, entire; flowers few together, in axillary whorls; pedicels very short; calyx tubular, 4 mm. long, strongly 12-15-ribbed, minutely setulose, teeth subequal, subulate, straight; corolla twice as long as calyx; stamens 4, anthers 2-celled; a small woody herb with perennial base; stems pubescent with long and short recurved hairs [1. punctata](#)

Older leaves 15-35 mm. long, crenate: **2**

- 2 Inflorescence of distant axillary whorls; a small slender, straggling herb branched from the base; stems softly pubescent and pilose; leaves subsessile, broadly ovate, rounded at base, up to 2 cm. long and nearly as broad, setose on the nerves beneath, crenulate; flowers about 6 in a whorl; pedicels up to 5 mm. long, pilose; calyx broadly tubular, about 12-nerved, 6-8 mm. long in fruit, teeth lanceolate, acuminate, subequal, pilose, curved upwards; corolla nearly twice as long as the calyx [2. pseudosimensis](#)

Inflorescence of many, dense, terminal, broad, sessile spikes, up to about 5 cm. long, rarely more; a stout, erect, branched, woody herb; branchlets very leafy, bristly-pubescent; leaves ovate-rotund, on the main shoots about 3.5 cm. long and on the terminal shoots about 1.5 cm. long, rounded or slightly cordate at base, sessile, crenate, strongly nerved beneath; mature calyx 4-5 mm. long, 13,15-ribbed, teeth subulate, short, equal, straight, shortly setose-pubescent; corolla shortly exerted from calyx [3. robusta](#)

1. **Satureja punctata** (*Benth.*) *Briq.* in E. & P. Pflanzenfam. 4, 3A: 299 (1896); Brenan in Mem. N.Y. Bot. Gard. 9: 45.

APD: *Synonym of Micromeria imbricata* (Forssk.) C. Chr. var. *imbricata*

Micromeria punctata *Benth.* (1834).

M. biflora of F.T.A. 5: 452; of F.W.T.A., ed. 1, 2: 278, not of (Buch.-Ham. ex D. Don) Benth.

M. purtschelleri *Gürke* (1891)-E. & K. Walther in Mitt. Thur. Bot. Ges. 1, 4: 10 (1957).

An erect or spreading heath-like plant with wiry stems up to 1 ft. or more high; flowers small, corolla rich pink; [growing in montane grassland](#).

[Br.] Cam.: Cam. Mt., 6,000-13,000 ft. (Dec.-Apr.) Dundas FHI 20358! Morton GC 6866! K746! Mann 1292! 1981! Bamenda, above 5,000 ft. (Dec.-Apr.) Richards 5296! Morton K18! 253! Jakiri (Feb.) Hepper 2071! Mambila Plateau (Jan.) Hepper 1682!

Extends to [Sudan](#), Congo, E. and S. Africa.

2. *Satureja pseudosimensis* *Brenan* l.c. 50 (1954).

APD: *Synonym of Clinopodium uhligii* var. *obtusifolium* (*Avetta*) *Ryding*

Calamintha simensis of F.T.A. 5: 455; of F.W.T.A., ed. 1, 2: 282; of Robyns Fl. Sperm. Parc Nat. Alb. 2: 163; not of Benth.

A much-branched, perennial, weak straggling herb, 6 in. to 2 ft. high, with mauve flowers about 1/3 in. long; the calyx frequently purple tinged; [in montane grassland and thicket](#).

[Br.] Cam.: Cam. Mt., 6,000-13,000 ft. (Dec.-Apr.) Duntap 241! Dalz. 8309! Mann 1292! 1981! Morton GC 6884! 7002! K588! Plumtre 230! Bamenda, above 6,000 ft. (Dec.-Apr.) Adams GC 11307! Morton K226! K256! Maitland 1392! 1487! F. Po: 8,500 ft. (Mar., Dec.) Mann 617! Guinea!

Also in the [Congo](#), [Sudan](#), [E. Africa](#) and [Nyasaland](#).

3. *Satureja robusta* (*Hook.f.*) *Brenan* l.c. 48 (1954).

APD: *Synonym of Clinopodium robustum* (*Hook. f.*) *Ryding*

Nepeta robusta *Hook. f.* (1864)-F.T.A. 5: 460; F.W.T.A., ed. 1, 2: 280.

An erect, branched, robust, aromatic perennial, 3-4 ft. or more high, with small flowers about 1/4 in. long; corolla white with mauve marks on the lip; [in montane grassland and scrub](#).

[Br.] Cam.: Cam. Mt., above 6,000 ft. (Dec.-Apr.) Dundas FHI 20357! Morton GC 6937! 6998! Plumtre 222! Bamenda, above 6,000 ft. (Dec.-April.) Ujor FHI 30021! Keay & Lightbody FHI 28354! Morton K156! Ndu, Nkambe Div. (Feb.) Hepper 1941! 1942! (See Appendix p. 462.)

[Thomson s.n. at Kew labelled " Old Calabar " presumably came from the slopes of Cam. Mt. on the Calabar side.)

23. SALVIA

Linn.-F.T.A. 5: 456.

- 1 Calyx truncate, not prominently lobed, densely white tomentellous, about 6 mm. long in fruit; corolla blue, about 15 mm. long, tube 7 mm. long; stamens not exerted; leaves lanceolate, about 5 cm. long and 2 cm. broad, acute, cuneate and long-petiolate at base, serrate, puberulous on the veins, gland-dotted beneath; stems sulcate puberulous, woody at base [1. *farinacea*](#)

Calyx distinctly 3-lobed, shortly pubescent; corolla usually red, sometimes pink, yellow or white: **2**

- 2 Calyx scarlet, inflated, large, 15 mm. long in flower, lobes ovate, mucronate; leaves ovate, acuminate, cuneate and long-petiolate at base, serrate, about 7 cm. long and 4 cm. broad, glabrous; stems sulcate, glabrous, woody below; corolla about 25 mm. long; stamens exerted [2. *splendens*](#)

Calyx green, not inflated, about 8 mm. long in flower, lobes ovate, acute not mucronate; leaves ovate, obtuse or acute, truncate at base, long-petiolate, 3-6 cm. long and 2-4 cm. broad, puberulous above, pubescent on the nerves beneath, serrate-crenate; stems sulcate, pubescent with long and short hairs; corolla about 23 mm. long; stamens long-exserted [3. *coccinea*](#)

1. *Salvia farinacea* *Benth.* Lab. Gen. & Sp. 274 (1833). APD acc

A perennial, bushy herb, several feet high, with blue flowers; [commonly cultivated and occasionally occurring as a garden throwout, etc.](#)

S. L.: Njala (Oct.) Deighton 2423! [Ghana](#): Legon (Dec.) Morton A2645!

Native of tropical America.

2. *Salvia splendens* Ker-Gawl. in Bot. Reg. 8: t. 687 (1823). *APD acc*

An erect, perennial, bushy herb several feet high, with scarlet flowers and calyx; commonly cultivated and occasionally escaping in our area.

Ghana: Achimota Irvine 454! (Jan.) Akpabla 1907! Amedzofe fide Morton. Aburi (July) Sampram 121! **S. Nig.:** Ibadan fide Morton.

A native of Brazil; commonly cultivated and occasionally escaping in our area.

3. *Salvia coccinea* Buc'hoz ex Ettl. *Salvia* 23 (1777); F.T.A. 5: 459; G. Taylor in Exell Cat. S. Tomé 267. *APD acc*

An erect bushy herb, up to 2 ft. high, with a green calyx and scarlet or more rarely yellow, pink or white flowers; commonly cultivated and frequently occurring as a weed on waste ground etc.

Mali: Ségou fide Roberty. **S. L.:** Freetown (Oct.) Deighton 1977! **Ghana:** Achimota Anoff! Akwei 2! Attoh 43! Morton A2446! Kumasi Kyei! Tamale fide Roberty.

A native of tropical America.

24. SCUTELLARIA

Linn.-F.T.A. 5: 461.

- 1 Inflorescence subglabrous to shortly pubescent, racemose, flowers paired at the nodes, with small leafy bracts; stems shortly pubescent; leaves ovate to lanceolate, shortly petiolate, small at time of flowering but up to 7 cm. long when mature, rounded-cordate at base, crenulate, puberulous on the nerves and slightly gland-dotted; pedicels short and pubescent; mature calyx shortly campanulate, about 1 cm. long, upper and lower lips broadly deltoid; corolla about 1.7 cm. long, pubescent, not glandular *1. paucifolia*

Inflorescence densely tomentose and glandular-pubescent, racemose; stems woody, pubescent; leaves full-grown at time of flowering, ovate-lanceolate, rounded or sub-cordate at base, crenate, about 5 cm. long and 2.5 cm. broad, petiolate, glandular-punctate, beneath; corolla about 1.3 cm. long, pubescent *2. violascens*

1. *Scutellaria paucifolia* Bak. in Kew Bull. 1895: 292; F.T.A. 6: 462.

APD: Synonym of Scutellaria schweinfurthii subsp. paucifolia (Baker) A.J. Paton

Scutellaria briguetii A. Chev. in Mém. Soc. Bot. Fr. 2, 8: 198 (1912); Chev. Bot. 523.

Rootstock of fusiform tubers producing erect, 4-angled stems up to 1 ft. high, with dark purple flowers appearing after grass-burning; the main leafy shoots develop later in the season and are straggling.

Guin.: Kindia (Aug.) Pobéguin 1520! Dabola (Mar.) Pobéguin 986! Fouta Djallon (Apr.) Chev. 12648! **S. L.:** Bintumane (Jan., Feb.) Glanville 476! Jaeger 4285! **Ghana:** Banda, Wenchi Dist. (Mar.) Morton GC 8612! A3273! A1094! Asare! **N. Nig.:** Jos Plateau (Apr.) Lely P245! S.W. of Jos (Dec.) Monod 9762!

Widely distributed in E. Africa.

2. *Scutellaria violascens* Gürke in Engl. Bot. Jahrb. 30: 392 (1901). *APD acc*

A shrub about 3 ft. high with stiff racemes of purple flowers.

[Br.] **Cam.:** Bamenda, 5,500 ft. (Jan., Aug.) Migeod 445! Ujor FHI 29991!

Also in **Cameroun** and **E. Africa**.

25. ACHYROSPERMUM

Blume-F.T.A. 5: 463; Perkins in Notizbl. Bot. Gart. Berl. 8: 78 (1921); E. A. Bruce in Kew Bull. 1936: 47. APD acc

- 1 Calyx irregular with 5 unequal teeth, 3 of which are partially united to form a broad lobe: **2**

- Calyx regular with 5 equal teeth, 8-10 mm. long when mature:**3**
- 2** Mature calyx 4-5 mm. long, ciliate, with 2 subacute teeth and a broad lobe with 3 very short obtuse triangular teeth, divided to near middle on one side; corolla 3-4 mm. long; inflorescences terminal and axillary 5 cm. long and 1 cm. broad or less; leaves ovate, shortly acuminate at apex, cuneate at base, up to 8 cm. long and 5 cm. broad, crenate; petiole about 1.5 cm. long; whole plant covered with a long soft pubescence [1. *dasytrichum*](#)
- Mature calyx about 7 mm. long, minutely puberulous, margin thinly ciliate, with 2 narrow triangular lobes and one broad lobe having 3 acute teeth; inflorescences lateral, about 2 cm. long; stem tomentose; leaves narrowly obovate-elliptic, acuminate, gradually narrowed to base, up to 15 cm. long and 6 cm. broad, crenate, subglabrous except for fine appressed pubescence on the veins beneath; petiole up to 1-5 cm. long**2.**
[schlechteri](#)
- 3** Calyx teeth as broad as long, ciliate around margin, green; inflorescence terminal 3-5 (-10) cm. long, 2 cm. broad; bracts broadly ovate, ciliate; leaves narrowly obovate-elliptic, acuminate at apex, cuneate and entire at base, 10-18 cm. long and up to 8 cm. broad, crenate, appressed-pubescent on nerves beneath; petiole 1-3 cm. long**3. *oblongifolium***
- Calyx teeth twice as long as broad; leaves ovate, sharply acuminate, rounded at base, cuneate, about 15 cm. long and 8 cm. broad, crenate-serrate; petiole up to 5 cm. long:**4**
- 4** Stem and leaves with long spreading pubescence; inflorescences terminal and lateral, elongate, conical, terminal inflorescences 8-12 cm. long and 1.5 cm. broad, lateral smaller; bracts broadly ovate, about 8 mm. long, green, pubescent with densely ciliate margin, deep pink; corolla exceeding calyx, pubescent, magenta with white throat; stamens exserted**4. *africanum***
- Stem and leaves thinly appressed-puberulous; inflorescences shorter and broader, 3-6 cm. long and 1-2 cm. broad (without the corolla); bracts almost orbicular, abruptly apiculate, membranous; bracts, calyx and corolla dark red **5. *erythrobotrys***
- 1. *Achyropermum dasytrichum* Perkins** in Notizbl. Bot. Gart. Berl. 8: 81 (1921). *APD acc*
- A small woody perennial with a creeping rhizome and erect aerial shoots; corolla cream; [occurring in forest farms](#).
- Ghana:** Kade Agric. Sta. (Dec.) Morton A3639!
- Also in **Cameroun**.
- 2. *Achyropermum schlechteri* Gürke** in Engl. Bot. Jahrb. 36: 127 (1905); E. A. Bruce in Kew Bull. 1936: 53. *APD acc*
- A woody perennial, with lateral inflorescences usually on the one year old shoots.
- S. Nig.:** Oban Talbot! **[Br.] Cam.:** Buea, 2,500 ft. Schlechter 12850!
- 3. *Achyropermum oblongifolium* Bak.** in F.T.A. 5: 464 (1900); Bruce l.c. 55; G. Taylor in Exell Cat. S. Tomé 266 *APD acc*
- Ocimum sassandrae* A. Chev.** Bot. 512, name only.
- An erect, little-branched undershrub, 1-2 ft. high, with tomentose stems and dense terminal spikes of greenish-white flowers; [in forest and bamboo thicket](#).
- Guin.:** Fassakoidou to Késséridou (Feb.) Chev. 20814! Ntongon Mt., 3,150 ft. (Mar.) Chev. 20926! **S.L.:** Kenema (Jan.) Thomas 7572! York Pass (Dec.) Deighton 3310! **Lib.:** Vahum, W. Prov. 5. *Achyrosporum erythrobotrys* *Perkins* in Notizbl. Eot. Gart. Berl. 8: 80 (1921); Bruce l.c. 56. *APD acc*

A much-branched shrub, up to about 6 ft. high, with dark red flowers and inflorescences.

S. Nig.: Ikwette Plateau, 5,200 ft., Obudu Div. (Dec.) Keay & Savory FHI 25211! [**Br. Cam.:** near L. Bambulue, 6,200 ft., Bamenda (Jan.) Keay & Lightbody FHI 28363!

Also in **Cameroun**.

[Note: *A. erythrobotrys* may only be a form of *A. africanum*, Keay & Savory FHI 25024! from Ijua, Ogoja Prov., S. Nigeria, is intermediate-J.K.M.,]

26. STACHYS

Linn.-F.T.A. 5: 465.

- 1 Stout erect or scrambling herbs; calyx 7-10 mm. long; corolla about 10 mm. long:2
Small annual, erect, branched herb 10-25 cm. high; stem hirsute; leaves 1.5-3 cm. long, ovate, truncate or cordate, crenate-serrate, petiolate; inflorescence a very lax spike, much interrupted below; whorls 2-6-flowered with foliose bracts which are smaller and subsessile above; calyx 4-6 mm. long, tubular-campanulate, hirsute with triangular mucronate teeth; corolla 6-7 mm. long3. *arvensis*
- 2 Leaves abruptly cuneate at base into a petiole 1 cm. or more long, ovate, acute at apex, about 5.5 cm. long and 4.5 cm. broad, unevenly and rather coarsely crenate-serrate, softly pubescent above, densely ferrugineous-hairy on veins beneath; stems softly and densely pubescent, stout, square; inflorescences terminal, contiguous, with numerous, crowded many-flowered whorls about 3.5 cm. diam. in fruit forming a dense pyramidal spike, with small leafy bracts which are densely pubescent with long eglandular and short glandular hairs; bracteoles small, subulate, pubescent; mature calyx 1 cm. long, campanulate, teeth lanceolate, 1/2 as long as the tube, densely pubescent; corolla about 1 cm. long1. *pyramidalis*
Leaves cordate at base, ovate-triangular, acute at apex, up to 5.5 cm. long and 4.5 cm. broad but usually less, evenly crenate, pilose above, whitish-pubescent especially on the veins beneath; petiole as long as the lamina, pilose; flowers in distant several-flowered whorls up to 2 cm. diam. in fruit, with leafy bracts; stems with stiff prickly bristles and short glandular hairs; mature calyx about 7 mm. long, campanulate, teeth lanceolate, 1/3 to 1/2 as long as the tube, densely pubescent; corolla about 1 cm. long2. *aculeolata*

1. *Stachys pyramidalis* *J. K. Morton* in *J. Linn. Soc.* 58: 273 (1962). *APD acc*

A stout, erect, branched herb with square grooved, densely hairy stems, and dense many-flowered, terminal, inflorescences.

N. Nig.: Lokoja (Oct.) Dalz. 104!

2. *Stachys aculeolata* *Hook. f.* in *J. Linn. Soc.* 6: 18 (1861); *F.T.A.* 5: 466; Th. C. E. Fries in Notizbl. Bot. Gart. Berl. 8: 629, fig. 1 & 2, incl. var. *camerunensis* Th. C. E. Fries (1923). *APD acc*

A perennial prickly herb with straggling, scrambling, rather slender stems and axillary whorls of flowers in the upper parts; corolla white or pale pink with dark pink markings; in openings in montane forest and in gullies in the grassland.

[**Br. Cam.:** Cam. Mt. (Jan.-Dec.) Maitland 926! Johnston 71! Keay FHI 28600! Morton GC 6707! 7003! Adams GC 11779! Bamenda (Dec.-Apr.) Maitland 1654! Richards 5320! 5323! Morton K102! K259! K306! **F. Po:** 9,000ft. (Dec.) Mann 319! Monod 68!

Also in the mountainous parts of **Cameroun**, **Congo**, **Ethiopia**, **Uganda** and **Kenya**.

3. *Stachys arvensis* (*Linn.*) *Linn. Sp. Pl.*, ed. 2, 2: 814 (1763); Chev. Bot. 523. *APD acc*

Glecoma arvensis *Linn. Sp. Pl.* 578 (1753).

A [weed of cultivated land](#); flowers pale purple.

Mali: Goundam, Timbuktu Chev. 2776!

Also occurring in N. Africa and widespread in Europe.

[A specimen in the British Museum labelled " Senegal 1848 " probably belongs to another species but is too poor for identification.]

28. LEONOTIS

(*Pers.*) *R. Br.*-F.T.A. 5: 490.

- 1 Corolla orange-brown, villous; stems tomentellous; leaves long-petiolate, ovate-triangular, broadly cuneate at base, the largest about 12 cm. long and 6 cm. broad, softly puberulous on both surfaces, coarsely serrate; flowers in globose whorls at the upper nodes; bracts crowded at base, linear, subulate, stiff, about 1 cm. long; pedicels very short; calyx 1.5 cm. long, shortly pubescent, teeth subulate, stiff, equal [1. *nepetifolia* var. *nepetifolia*](#)

Corolla cream, otherwise as above [la. *nepetifolia* var. *africana*](#)

1. *Leonotis nepetifolia* (Linn.) Ait. f. var. *nepetifolia*-in Ait. Hort. Kew., ed. 2: 409 (1811); Chev. Bot. 524. *APD acc*

Phlomis nepetaefolia Linn. (1753).

A robust herb 4-8 ft. high, [mainly found around dwellings and sometimes cultivated](#), but not common.

Guin.: Moussaia (Nov.) Schnell 2078! **S. L.:** (June) T. Vogel 94! Sherbro Sc. Elliot 5765! Makene (Apr.) Deighton 5500! Mano (Oct.) Deighton 2542! **Lib.:** Kakatown Whyte! **Iv. Also in **Congo**.

- 2. Tinnea aethiopica** *Kotschy & Peyr.* Plant. Tinn. 25, t. 11 (1867); F.T.A. 5: 497; Bot. Mag. tt. 5637 & 6744; Robyns l.c. 182. *APD acc*

A shrub, up to 8-10 ft. high, with dusky purple flowers 1/2 in. long.

Mali: Bamako (Jan.) Roberty 10382! **N. Nig.:** Katagum Dalz. 108! Kachia to Kaduna (Nov.) Meikle 1208! Jos Plateau (fl. May, fr. Dec.) Monod 9761! Lely P256! Batten-Poole 199! Zelau, 3,200 ft. Lely 112! Sara Hills, Bauchi Div. (Oct.) Hepper 1118! [**Br.**] **Cam.:** Vogel Peak (Nov.) Hepper 1371!

Extends to the Congo, **Sudan**, E. Africa and Nyasaland.

MONOCOTYLEDONES

BUTOMACEAE

Perennial, aquatic or swamp rhizomatous herbs, usually with milky juice. Leaves ensiform to orbicular. Flowers solitary or umbellate. Perianth 2-seriate, the outer 3 usually sepal-like, imbricate, the inner 3 petal-like and usually thin and deciduous. Stamens hypogynous, 8-9 or numerous; anthers basifixed, opening laterally. Carpels free; ovules numerous, scattered, on the reticulately branched parietal placentas. Fruits opening by the adaxial suture. Seeds numerous, without endosperm.

Temperate and tropical regions.

Distinguished from all other Monocotyledons by the peculiar placentation of the ovules, probably a primitive characteristic.

TENAGOCHARIS

Hochst. in Flora 24: 369 (28 June 1841).

Butomopsis Kunth. (July 1841)—F.T.A. 8: 214.

Scapigerous marsh herbs with milky juice; leaves radical, petiolate. Flowers umbellate, with membranous bracts. Sepals 3, persistent. Petals 3, smaller than sepals, fugacious. Stamens 9, in 2 whorls. Carpels about 6; ovules numerous.

- 1 Rootstock small, with slender fibrous roots; leaves all radical, long-petiolate, oblanceolate, shortly and subobtusely acuminate, gradually narrowed to the base, about 10 cm. long and 3 cm. broad, glabrous, with 2 pairs of ascending parallel nerves, faintly reticulate between the nerves; umbels long-pedunculate, about 3-8-flowered; pedicels up to 11 cm. long in fruit; sepals ovate, about 1 cm. long in fruit, thin with membranous margins; petals shorter than the sepals; stamens usually 9; carpels usually 6, overtopping the calyx in fruit; seeds minute [latifolia](#)

Tenagocharis latifolia (D. Don) Buchen. in Abh. Nat. Ver. Bremen 2: 3 (1869); Van Steenis in Fl. Males. ser. 1, 5: 118 (1954); Carter in F.T.E.A. Butomac.: 1, fig. 1 (1960).

APD: Synonym of Butomopsis latifolia (D. Don) Kunth

Butomus latifolius D. Don (1825).

B. lanceolatus Roxb. (1832).

Butomopsis lanceolata (Roxb.) Kunth. (1841)—F.T.A. 8: 214; Chev. Bot. 687.

Tenagocharis lanceolata Dur. & Schinz (1895).

Annual herb from a few inches up to more than 1 ft. high (including the inflorescences), with erect leaves; flowers white; **in swamps**.

Sen.: Roger 69! Bakel Heudelot 126! Matam (fl. & fr. Nov.) Trochain 983! Carabane, Casamance (fr. Jan.) Chev. 2593! **Mali:** Douentza (fr. Dec.) de Wailly 5293! Gorinnta, near Dogo (Apr.) Davey 607! Port. G: Bafata Esp. Santo 2350; 2857. Antula, Bissau Esp. Santo 2562. **Guin.:** Siguiri (Nov.) Jac.-Fél. 520! **Ghana:** Nasia, N.T. (fr. Dec.) Vigne FH 4670! Kamba, Lawra (Nov.) Harris! Damongo to Yapei (Sept.) Hall CC 893! **N. Nig.:** Nupe Barter 1509! Dikwa (fl. & fr. Apr.) H. B. Johnston 82!

Also in **Cameroun**, **C. African Rep.**, **Sudan** and **Uganda**. In Asia it occurs in India, the Malay Islands, and N. Australia.

HYDROCHARITACEAE

Fresh-water or salt-water herbs, partly or wholly submerged; roots sometimes floating. Leaves radical or cauline, alternate to whorled. Flowers hermaphrodite or unisexual, arranged in a tubular spathe or within two opposite bracts, females solitary; peduncle sometimes spirally twisted in fruit. Perianth-segments free, 1-2-seriate, 3 in each series, the outer often green, valvate, the inner petaloid. Stamens numerous to 2. Male flowers with rudimentary ovary. Staminodes usually present in the female flower.

Ovary inferior, 1-locular, with parietal placentas sometimes protruding nearly to the middle of the ovary. Ovules numerous. Fruit rupturing irregularly. Seeds numerous, without endosperm.

Warmer regions of the world.

Advanced relatives of the preceding family, but with the ovary inferior.

- 1 Stems very short; leaves all radical; spathes pedunculate:2
 Stems elongated, with numerous small leaves; spathes sessile, male spathes 2—many-flowered; perianth-segments 6, in two series4. *Lagarosiphon*
- 2 Perianth-segments 6, in two series:3
 Perianth-segments 3, in one series; spathes not winged; male flowers minute, very numerous, freed from the spathe when mature; fruiting peduncle spirally coiled3. *Vallisneria*
- 3 Spathes 2-winged; petals conspicuous and broad; styles 2-fid; leaves broad, long and thin; hermaphrodite1. *Ottelia*
 Spathes not winged; petals linear; styles simple; leaves stiff, linear; dioecious2. *Blyxa*

Hydrocharis chevalieri (De Wild.) Dandy

Occurs from Congo to E. Cameroun and may also be found within our area.

1. OTTELIA

Pers., Syn. Pl. 1: 400 (1805); F.T.A. 7: 6.

- 1 Roots numerous, slender, yellowish-brown when dry; leaves oblanceolate, subacute, gradually narrowed into the wing-like petiole, averaging about 30 cm. long and 6 cm. broad, often much smaller, glabrous, very thin; spathe compressed, narrowly oblong-elliptic, 2-winged, shortly lobed, 2-5.5 cm. long, faintly nerved; beak of the ovary not or only shortly exerted from the spathe, narrow; outer perianth-segments oblong-lanceolate, up to about 2 cm. long, green, inner segments rich yellow or white, about twice as long as the outer; fruit about as long as and enclosed in the somewhat expanded spathe*ulvifolia*

Ottelia ulvifolia (Planch.) Walp. Ann. 3: 510 (1853); Berhaut, Fl. Sén. 185; Obermeyer in Fl. S. Afr. 1: 109, fig. 35, 1 (1966).

Damasonium ulvaefolium Planch. in Ann. Sci. Nat. Sér. 3, 11: 81 (1849).

Ottelia lancifolia A. Rich. (1851)—F.T.A. 7: 7, incl. var. *fluitans* Ridl. (1886).

Ottelia vesiculata Ridl. (1886)—F.T.A. 7: 7.

Ottelia plantaginea Welw. ex Ridl. (1886)—F.T.A. 7: 7.

Ottelia abyssinica (Ridl.) Gürke (1904).

Boottia abyssinica Ridl. (1886)—F.T.A. 7: 9.

A submerged aquatic in muddy pools, leaves often purple-tinged; flowers just above water-level, yellow or white (dried specimens always appear to be yellow).

Widespread in tropical Africa, reaching Transvaal and Madagascar.

2. BLYXA

Nor. ex Thou., Gen. Nov. Madag. 4 (1806); F.T.A. 7: 6.

- 1 Leaves in a rosette, submerged, narrowly lanceolate, ending in a very sharp point, about 3 cm. long and 0.5 cm. broad, prominently 3-nerved, shortly setulose on the nerves below and on the margin; male spathes pedunculate, about 2 cm. long; peduncle at length elongated and filiform; male flowers on filiform pedicels; female spathes 3 cm. long in fruit; seeds flattened, lanceolate, acute, with jagged-dentate wings ..[senegalensis](#)

Blyxa senegalensis *Dandy* in J. Bot. 72: 42 (1934); Berhaut, Fl. Sén. 183.

A submerged aquatic with a rosette of about a dozen sharply pointed leaves; the thread-like male peduncle about 5 in. long arises from the centre of the rosette and bears a spathe with two floating white flowers on pedicels about 2 in. long.

Sen.: Tambacounda (Nov.) Chev. 34005! 34016! 34018! Berhaut 1651! 3256. Kindia (Sept.) Jac.-Fél. 1847! **S. L.:** Kukuna, N. Prov. (Apr.) Morton & Gledhill SL 55!

3. VALLISNERIA

Linn., Sp. Pl. 1015 (1753); F.T.A. 7: 5.

- 1 Submerged; leaves elongated, linear, denticulate, up to about 30 cm. long or more and about 6 mm. broad, glabrous; spathes dioecious; male spathes many-flowered, female 1-flowered; male flowers becoming detached from the axis and floating in the water, where pollination is effected with the single female flower, which after fertilization is drawn down by the spirally coiling peduncle; perianth-segments 3; stamens 2; ovary 1-celled with 3 parietal placentas; capsule about 5 cm. long[aethiopica](#)

Vallisneria aethiopica *Fenzl* in Sitzb. Akad. Wien, Math.-Nat. 51 Abth. 1: 139 (1865); F.T.A. 7: 5.

Vallisneria spiralis of F.T.A. 7: 5; F.W.T.A., ed. 1, 2: 301, not of Linn.

Submerged aquatic with ribbon-like leaves; **in fresh or brackish water.**

Sen.: Sedhiou, Casamance Adam 18436! Berhaut 6417! **Ghana:** Kpong Irvine 3010! Ajena, Senchi Akabla 1833! Otisu, Kete-Krachi Morton GC 9162! Tefle R., Volta (Apr.) Pople & Hall 3627! **S. Nig.:** Lagos Barter 2163!

Extending to **Ethiopia** and Rhodesia.

4. LAGAROSIPHON

Harv. in Hook., Journ. Bot. 4: 230 (1841); F.T.A. 7: 2.

- 1 Leaves more or less alternate, not verticillate, closely inserted, linear-lanceolate, acute, about 1 cm. long and 1 mm. broad, with about 60 minute teeth on each side; stipules 2, intrafoliaceous, obovate, obtuse; female spathe subtire at the apex, with 2-3 teeth on each side[L. schweinfurthii](#)
- Leaves verticillate, linear-lanceolate, very acute, 2-3 cm. long, 3 mm. broad, with numerous minute very acute teeth on each side; female spathe bearing 1 perfect and 1 rudimentary flower; male spathe bilobed bearing 2 perfect and (?) 1 rudimentary flower; outer perianth-segments 3, 3 mm. long; inner perianth-segments 3, 7 mm. long, 4 mm. broad, irregularly trilobed at apex[2. hydrilloides](#)

1. **Lagarosiphon schweinfurthii** *Casp.* in Bot. Zeit. 28: 88 (1870); F.T.A. 7: 3.

Submerged aquatic with numerous sessile leaves.

Mali: Banani marsh, near Sanga (Dec.) Monod!

Also in **Sudan**.

[The specimen cited above (from IFAN, Dakar) is sterile and the determination is tentative—F.N.H.]

2. **Lagarosiphon hydrilloides** *Rendle* in J. Linn. Soc. 30: 381, t. 32, figs. 1-7 (1895); F.T.A. 7: 4.

Submerged, densely leafy aquatic rooting in streams; male flowers white, borne on slender pedicels about 2 in. long.

Ghana: Ejisu, Kumasi (May) Akpabla 9419!

Also in **Uganda** and **Kenya**.

ALISMATACEAE

Perennial or annual marsh or aquatic herbs, erect, or rarely with floating leaves; leaves basal, with elongated petioles sheathing but open at the base and linear-lanceolate to ovate-rounded often sagittate blades, the principal nerves parallel with the margins and converging at the apex of the blade, the transverse nerves often close and parallel. Flowers often whorled, racemose or paniculate, bisexual or rarely polygamous, actinomorphic. Torus flat to globose. Perianth 2-seriate, the outer 3 imbricate, persistent, green and sepal-like, the inner 3 petaloid, imbricate and deciduous or rarely absent. Stamens hypogynous, 6 or more, rarely 3, free; anthers 2-locular, extrorse. Carpels free or rarely united at the base, sometimes in a single whorl; style persistent; ovules solitary or several, basal or on the inner angle. Fruit a bunch or whorl of achenes, rarely dehiscent at the base. Seeds curved, with horseshoe-shaped embryo; endosperm none.

- 1 Leaves cuneate at base:2
Leaves cordate or sagittate:4
- 2 Flowers usually solitary or with up to 3 in a pseudo-umbellate inflorescence of 1 whorl; carpels very numerous, crowded in a subglobose mass, beaked, compressed; receptacle oblong; sepals and petals distinct from each other [1. *Ranalisma*](#)
Flowers numerous in several whorls or on a panicle:3
- 3 Inflorescence unbranched, flowers sessile or subsessile in several whorls; monoecious; bracts united into a membranous sheath; stamens 3; carpels 3-6, 3-ribbed on the back at maturity [2. *Wiesneria*](#)
Inflorescence branched, paniculate; flowers pedicellate; petals smaller than the sepals; dioecious; stamens 9; carpels 8-20, lateral faces with a flange at maturity [6. *Burnatia*](#)
- 4 Leaves cordate; inflorescence branched; carpels 10-15; receptacle very small [3. *Caldesia*](#)
Leaves sagittate:5
- 5 Carpels very numerous, crowded, compressed; receptacle large; flowers few on an unbranched scape-like inflorescence [4. *Sagittaria*](#)
Carpels 10-20 (-30), ovoid; receptacle very small, inflorescence more or less paniculate [5. *Limnophyton*](#)

1. RANALISMA

Stapf in Hook., Ic. Pl. t. 2652 (1900).

Echinodorus of F.T.A. 8: 211, partly, not of L. C. Rich.

- 1 A small herb with slender roots; leaves all radical, long-petiolate, ovate or oblong-elliptic, subacute, rounded at the base, about 3 cm. long and 1.5 cm. broad, glabrous, with 1 or 2 pairs of ascending nerves, and prominent oblique transverse nerves; submerged leaves linear lanceolate, up to 10 cm. long; flowers hermaphrodite, solitary on fairly long pedicels; sepals 3, herbaceous; petals 3, larger than the sepals; stamens 6 or more; carpels numerous in a subglobose head, long-beaked in fruit and compressed [humile](#)

***Ranalisma humile* (Kunth) Hutch.** in F.W.T.A., ed. 1, 2: 303 (1936); Berhaut, Fl. Sén. 184; Carter in F.T.E.A. Alismatac. 2, fig. 1 (1960). *APD acc*

Alisma humile Kunth, Enum. Pl. 3: 154 (1841).

Echinodorus humilis (Kunth) Buchen. (1869)-F.T.A. 8: 211; Chev. Bot. 686; den Hartog in Fl. Males. 5: 325 (1957).

A small aquatic 1-2 in. high in mud or up to 6 in. if growing in water; flowers white, head of fruits prickly with persistent styles; **in marshy places.**

Sen.: Roger 58! Kaédi Chev. 2592! Berhaut 1400. **Mali:** Télé Lake (Apr.) Leclercq in Hb. Chev. 42467. Nvafemke Rogeon 119. Gombomba (fl. & fr. Feb.) Davey 49! Ansongo (fl. & fr. Mar.) de Wailly 5366! **N. Nig.:** Katagum Dist. Dalz. 311! Zaria Milne-Redhead 5027! Gashua (fr. Mar.) Tuley 1105!

2. WIESNERIA

M. Micheli in DC., Monogr. Phan. 3: 82 (1881); F.T.A. 8: 213; F.W.T.A., ed. 1, 2: 303.

- 1 Roots thick, septate; leaves all radical; petiole 11-34 cm. long, 4-6 mm. broad, septate, expanded at base, slightly constricted at apex; lamina elongate-linear-oblongate, subobtusate at apex, 8-12 cm. long, 5-14 mm. broad, with an intramarginal nerve and faintly reticulate; flowers monoecious, in an unbranched scape, the females in whorls in the lower part, the males in the upper part; bracts united into a truncate membranous sheath; stamens 3; carpels 3-6, 3-ribbed on the back, beaked, muciculate on the margin [schweinfurthii](#)

Wiesneria schweinfurthii Hook. f. in Benth. & Hook. f., Gen. Pl. 3: 1007 (1883); F.T.A. 8: 214; Berhaut, Fl. Sén. 184. *APD acc*

Wiesneria sparganiifolia Graebn. (1912).

Submerged aquatic with the appearance of a Potamogeton; flowers monoecious; in pools on laterite rocks.

Sen.: Tambacounda Berhaut 1269; 3257. **Mali:** Sikasso (fl. & fr. Sept.) Adam 15304! **S. L.:** Kambia (fr. Aug.) Jordan 963! **N. Nig.:** Katagum (fl. & fr. May) Dalz. 202!

Also in **E. Cameroun**, **C. African Rep.**, **Congo**, **Sudan**, **Zambia** and **Rhodesia**.

3. CALDESIA

Parl., Fl. Ital. 3: 598 (1858). *Alisma* of F.T.A. 8: 207, partly.

- 1 Leaves and bracts pellucid-punctate; lamina ovate, 6-10 cm. long along midrib, obtuse at the apex, deeply cordate with obtuse lobes, nerves 9-17 with cross veins 2-5 mm. apart; inflorescences 1-3, well-branched; lower bracts lanceolate, acute, about 3 cm. long; pedicels 1-3.5 cm. long usually arcuate, in fruit; sepals 1.5-2 mm. long; petals 2.5 mm. long; achenial fruits kidney-shaped, laterally compressed, 3-4 mm. long, dorsally with 4 longitudinal ribs densely set with blunt spiny warts [1a. oligococca var. echinata](#)

Leaves and bracts not pellucid-punctate; lamina broadly ovate to suborbicular, 2.5-6 cm. long along midrib, rounded at the apex, deeply cordate at the base with rounded lobes, nerves 13-17 with cross veins about 0.5 mm. apart; inflorescence 1-few, well-branched, rather stout, lower bracts oblong up to 1 cm. long; pedicels 1 cm. long, remaining erect in fruit; sepals 3 mm. long; petals slightly longer; achenial fruits obovate, with persistent style, 2 mm. long, longitudinally ribbed, smooth [2. reniformis](#)

1. **Caldesia oligococca** (F. von Muell.) Bunchen. in Engl., Bot. Jahrb. 2: 479 (1882). *APD acc*

Vars. *oligococca* and *acanthocarpa* (F. von Muell.) den Hartog occur in tropical Asia and Australia.

- 1a. **Caldesia oligococca var. echinata** den Hartog in Fl. Males. 5: 322, fig. 1, 2a-d (1957). *APD acc*

An aquatic herb with broad floating leaves and sometimes submerged linear phyllodes; paniculate inflorescences about 2 ft. high; with white flowers and spiny fruits; at the edge of permanent swamps.

Sen.: Niokolo-Koba (fr. Dec.) Raynal 6877! **N. Nig.:** Nupe Barter 1062!

Also in **India**, **Ceylon**, **Indo-China** and **Java**.

2. **Caldesia reniformis** (D. Don.) Mackino in Bot. Mag. Tokyo 20: 34 (1906); Carter in F.T.E.A., Alismatac. 7, fig. 4 (1960). *APD acc*

Alisma reniforme D. Don, Fl. Nepal 22 (1825).

A. parnassifolium of F.T.A. 8: 208; of Chev. Bot. 686; not of Bassi.

Caldesia parnassifolia var. nilotica (M. Micheli) Buchen. (1903).

An aquatic with floating leaves; paniculate inflorescences 1-2 ft. high, with white flowers and smooth fruits; in swamps.

Dah.: Khuon lagoon, Abomey Circle Chev. 23264! **N. Nig.:** Thornewill 96! Matyoro (fr. Oct.) Thornewill 143!

Widespread in tropical and N. Africa, Madagascar and eastwards to India, Malaysia, China and Australia.

4. SAGITTARIA

Linn., Sp. Pl. 993 (1753); Bogin in Mem. N.Y. Bot. Gard. 9: 179-233 (1955).

Lophotocarpus Dur. (1888)—F.T.A. 8: 210; F.W.T.A., ed. 1, 2: 303.

- 1 Rootstock small, with numerous slender roots; leaves all radical, long-petiolate, ovate in outline, deeply sagittate at the base, 5-9 cm. long, up to 8 cm. broad, with numerous nerves radiating from the base; scapes few-flowered, unbranched; flowers polygamous, few in each whorl, the lower hermaphrodite; pedicels stout; bracts triangular-ovate, up to 1 cm. long; sepals 3, veined; petals 3, larger; stamens 9-15; carpels numerous, crowded, compressed, with rugose margins *guayanensis* subsp. *lappula*

Scattered throughout much of tropical Africa.

TRIURIDACEAE

Leafless saprophytic herbs with simple or subsimple stems furnished with a few pale scales. Flowers very small, racemose or subcorymbose, with decurved bracteate pedicels, actinomorphic, monoecious, dioecious or rarely polygamous. Perianth-segments 3-8, 1-seriate, valvate, sometimes appendaged at the apex, at length reflexed. Male flowers: stamens 2-6, sometimes only half of them fertile; anthers free or immersed in the mass of the receptacle, 2-locular, dehiscing mostly transversely; connective sometimes produced into long subulate appendages. Female flowers rarely with staminodes. Carpels

several, free, 1-locular; style terminal to almost basal; ovule solitary, basal. Fruits crowded, opening by a slit. Seed erect, with a fleshy white oily undifferentiated nucleus.

Tropics; rare in Africa.

SCIAPHILA

Blume, Bijdr. 514 (1825).

Perianth 3-8-partite or deeply lobed. Anthers sessile or subsessile at the base of the perianth. Style ventral or basal in fruit.

- 1 Racemes about 9 cm. long, about 12-flowered; lower flowers female, upper male; leaves reduced to scales, ovate-triangular; bracts ovate-lanceolate, about 2 mm. long; pedicels curved, 7-8 mm. long, glabrous; perianth-segments reflexed, lanceolate, 1.25 mm. long, hairy at the tips; fruits ellipsoid; seeds ribbed, subacute at one end [1. ledermannii](#)

Racemes 15-20 cm. long, with very numerous flowers; leaves linear-lanceolate, 3-4 mm. long; bracts linear, reflexed, persistent; pedicels spreading-recurved, slender, about 1 cm. long, pale glaucous-purple; perianth-segments 6, triangular, ending in a hair, not reflexed; fruits ellipsoid, minutely pitted when dry [2. africana](#)

1. *Sciaphila ledermannii* Engl. Bot. Jahrb. 43: 304 (1909). *APD acc*

A rigid saprophytic herb 3-4 in. high among dead leaves in damp sandy places on the forest floor; aerial parts deep coral pink, perianth paler, subterranean parts whitish.

S. Nig.: Oban (Mar.) Talbot 710! 1473! Richards, Onochie & Coombe 5141!

Also in **E. Cameroun**.

2. *Sciaphila africana* A. Chev. in Mém. Soc. Bot. Fr. 2, 8: 96 (1908); Chev. Bot 686. *APD acc*

A slender saprophyte about 1 ft. high, with numerous small nodding unisexual flowers on slender pedicels.

IV. C.: Aké Assi 9476! Mt. Copé, Tepos country, Cavally Basin (fr. July.) Chev. 19661! **Ghana:** Ankasa F.R. (Jan.) Enti & Hall GC 36286!

APONOGETONACEAE

Fresh-water aquatic herbs with submerged or floating leaves; rhizome tuberous, with fibrous roots. Leaves long-petiolate, or sessile, oblong-elliptic to linear, with few principal parallel nerves and numerous transverse secondary nerves. Flowers hermaphrodite or rarely unisexual, spicate-scapose, spike simple or usually 2- (rarely up to 8-) forked, without bracts. Perianth-segments 1-3, or absent, sometimes petaloid and bract-like, equal or unequal, usually persistent. Stamens 6 or more, free, hypogynous, persistent; anthers extrorse, 2-locular. Carpels free, 3-6, sessile; style short; ovules 2 or more, ascending. Fruits opening on the adaxial side. Seeds without endosperm.

Warm regions from India and South China through Malaya to Australia, but most numerous in Tropical and S. Africa and in Madagascar.

APONOGETON

Linn. f., Suppl. 32 (1781); F.T.A. 8: 216; K. Krause & Engl. in Engl., Pflanzenr. 4, 13: 9 (1906). *APD acc*

Aquatics. Scapes simple or bifid, with unilateral flowers. Perianth-segments 1-3, white or coloured. Styles distinct.

- 1 Leaves long-petiolate, oblong, cordate at the base, obtuse at the apex, 16-20 cm. long, 3-4.5 cm. broad, with a broad midrib and 3 longitudinally parallel nerves on each side, and numerous closely parallel spreading transverse nerves between; spikes long-pedunculate, 2-forked, not secund, arms about 3 cm. long in flower, about 6 cm. long in fruit; fruiting carpels ovoid-ellipsoid, beaked; perianth small and bract-like [1.](#)

subconjugatus

Leaves sessile, linear, up to 15 cm. long, subacute, with no distinct midrib but with several distinct longitudinally parallel nerves; peduncles very slender; spikes unbranched, secund, about 2 cm. long; basal bract oblong-lanceolate, apiculate, 1 cm. long; perianth-segments conspicuous, white, veined[2. vallisnerioides](#)

1. **Aponogeton subconjugatus** *Schum. & Thonn.* in *Beskr. Guin. Pl.* 183 (1827); *F.T.A.* 8: 217; Berhaut, *Fl. Sén.* 179, 185. *A. heudelotii* Engl. (1887). *APD acc*

An aquatic with floating leaves in pools; flowers yellowish.

Sen.: Walo Heudelot 433! Berhaut 1752. **Mali:** Dogo (Dec.) Davey 1! Ouario to Koubita (Feb.) Davey 41! Berra near Gao (Nov.) de Wailly 4731! **Ghana:** Thonning! Achimota (June) Irvine 1468! Also **Congo, Sudan, Uganda** and **Kenya**.

Zostera nana *Roth*

It has been reported from Mauritanian coasts and it may also occur within our area.

The genus *Zostera*, in its own family *Zosteraceae*, is placed by Hutchinson in the *Aponogetales*. The Engler System (ed. 12) places the genus in *Potamogetonaceae*.

POTAMOGETONACEAE

Aquatic herbs of fresh, water. Leaves alternate or opposite, those immersed thin, those above water often leathery, sheathing at the base, sheath free or partially adnate to the petiole. Flowers hermaphrodite, small, arranged in pedunculate axillary spikes; peduncle surrounded by a sheath at the base; bracts absent. Perianth of 4 free rounded shortly clawed valvate segments. Stamens 4, inserted in the claws of the segments; anthers extrorse, 2-locular, sessile. Carpels 4, free, 1-locular; stigmas sessile or on short styles; ovule solitary, on the adaxial angle. Fruits free, 1-seeded, indehiscent. Seeds without endosperm.

One genus, *Potamogeton*, widely distributed.

POTAMOGETON

Linn., *Sp. Pl.* 126 (1753); *F.T.A.* 8: 219; Dandy in *J. Linn. Soc.* 50: 507-540 (1937).

Characters of the family.

- 1 Submersed leaves about 20 mm. broad, broadly linear, narrowed to each end, 15-25 cm. long, very thin, with about 7 longitudinal nerves, rarely upper leaves floating; spikes many-flowered, about 4 cm. long; fruits obliquely ovoid, beaked, 2-5 mm. long [1. schweinfurthii](#)
- Submersed lower leaves 1-2 mm. broad, linear, 5-6 cm. long, upper leaves sometimes expanded into elliptic lamina 1-2 cm. long, 3-6 mm. broad, more or less floating; spikes small and few-flowered; peduncle 3-5 cm. long, stout; flowering portion about 1 cm. long; fruits about 2 mm. long [2. octandrus](#)

1. **Potamogeton schweinfurthii** *A. Benn.* in *F.T.A.* 8: 220 (1901); Dandy l.c. 526, fig. 6 (map); Berhaut, *Fl. Sén.* 81; Obermeyer in *Fl. S. Afr.* 1: 66, fig. 18, 2 (1966). *APD acc*

Potamogeton lucens var. **fluitans** of *F.T.A.* 8: 221, not of Coss. & Germ.

Submerged aquatic with very thin rather large leaves.

Sen.: Lake Guier (fr. Jan.) Leprieur! Roger! **Mali:** Gao (Feb., Mar.) de Wailly 4827! 4976! **Iv. C.:** Banfora to Tiafora (Apr.) Aké Assi 8617! **N. Nig.:** Mallam Fatori, Chad Dist. G. Jackson FHI 59167!

Also widespread in E. and S. Africa.

[A sterile specimen (Melville 488) from L. Biao, F. Po, may also be this species.]

2. **Potamogeton octandrus** *Poir.* in Lam., Encycl. Méth., Bot., Suppl. 4: 534 (1816); Dandy l.c. 517, fig. 2 (map); Obermeyer l.c. 65, fig. 16, 1 (1966). *APD acc*

Potamogeton javanicus *Hassk.* (1856)—F.T.A. 8: 202, partly.

Potamogeton preussii *A. Benn.* in F.T.A. 8: 222 (1901), partly; Graebner in Engl., Pflanzenr. Potamogetonac. 106, partly.

An aquatic with fine submerged leaves and often broader floating ones.

Sen.: Niokolo-Koba (fr. Feb.) Adam 17576! **Mali:** Gao (fr. Feb.) de Wailly 4834! Gorintha, Dago (fr. Apr.) Davey 608! **S. L.:** Rhombe (fr. Mar.) Adames 144! Gbap (fr. Apr.) Hepper 1849! **W. Cam.:** Johann-Albrechtshöhe (= Kumba) Staudt 462! Barumbi-ba-Mbu Preuss 451! Throughout the Old World Tropics.

Several other species occur in suitable places near the northern limit of the Flora: *P. hoggarensis* Dandy, *P. panormitanus* Biv. and *P. perfoliatus* Linn.

RUPPIACEAE

Aquatic herbs of saline marshes. Leaves opposite or alternate, linear or setaceous, sheathing at the base. Flowers hermaphrodite, small, in terminal spikes at first enclosed by the sheathing base of the leaves, at length much elongated; bracts and perianth absent. Stamens 2; filaments short, broad; anthers extrorse, loculi reniform and separated by the connective. Carpels 4 or more, free, stigmas peltate or umbonate. Ovule solitary, pendulous. Fruits long-stipitate with spirally twisted stalks, indehiscent. Seeds pendulous, without endosperm.

Salt marshes throughout temperate and tropical regions.

RUPPIA

Linn., Sp. Pl. 127 (1753); F.T.A. 8: 224

- 1 A very slender profusely branched herb with long linear leaves about 0.5 mm. broad arising from hyaline sheaths; fruit drupaceous, about 3 mm. long *maritima*

Ruppia *maritima* *Linn.* Sp. Pl. 127 (1753); Obermeyer in Fl. S. Afr. 1: 61, fig. 15, 1 (1966). *APD acc*

Ruppia spiralis of F.T.A. 8: 224, not of Hartm.

Potamogeton pusillus of Fl. Nigrit. 528, not of Linn.

P. pectinatus of F.T.A. 8: 223, partly, not of Linn.

A submerged aquatic.

Sen.: Cayor Leprieur! Gandide Trochain 2778! **Ghana:** Cape Coast Don! Teshi (fr. June) Irvine 2777! Labadi Lagoon (fr. Jan.) de Wit & Morton A3002! Prampram (fr. Feb.) Morton GC 6419! **N. Nig.?:** (fr. Nov.) E. Vogel!

Widespread in the tropics.

ZANNICHELLIACEAE

Submerged aquatic herbs in fresh, brackish, or salt water; rhizome creeping, slender. Leaves alternate or opposite, or crowded at the nodes, linear, sheathing at the base, sheaths mostly ligulate at the apex; flowering leaves sometimes reduced to sheaths. Flowers minute, monoecious or dioecious, axillary, solitary or in cymes. Perianth of 3 small free scales, or absent. Stamens 3, 2 or 1; anthers 2-1-locular,

opening lengthwise; pollen globose or thread-like. Carpels 1-9, free; style simple or 2-4-lobed. Ovule solitary, pendulous. Fruits sessile or stipitate, indehiscent. Seed pendulous, without endosperm.

Widely distributed, mainly in salt water.

- 1 Styles 2-fid; anthers at an equal height; leaf-apex rounded, toothed [1. *Cymodocea*](#)
 Styles simple; one anther attached higher than the other; leaf-apex bicuspidate [2. *Halodule*](#)

1. CYMODOCEA

Konig in *Konig & Sims*, *Ann. Bot.* 2: 96 (1805); *F.T.A.* 8: 228; *Graebner* in *Engl., Pflanzenr.* 4, 11: 146 (1907).

Perianth absent from the male flowers. Stamen 1, on a slender filament. Carpels curved.

- 1.1. Rhizome creeping, marked with circular scars at the nodes; leaf-sheaths auriculate, up to 5 cm. long, deciduous; leaf-blades linear, toothed near the apex, up to 1 m. long and 3-5 mm. broad, about 7-nerved; male flowers long-pedunculate; carpels 2, collateral, each with 2 long stigmas; fruit sessile, obliquely ovoid, 1 cm. long, keeled, shortly beaked [nodosa](#)

Cymodocea nodosa* (*Ucria*) *Aschers. in *Sitzungsber. Ges. Naturf. Fr., Berlin* 1867: 4 (1867); *F.T.A.* 8: 229; *Graebner* l.c. 147; *Bossier, Fl. Orient.* 5: 21; *Feldmann* in *Bull. Soc. Nat. Afr. Nord* 29: 111 (1938). *APD acc*

Zostera nodosa *Ucria* (1790).

A marine aquatic.

Maur.: Murat! (vide *Feldmann* l.c.) **Sen.:** Joul, and mouths of the river (vide *Boissier* l.c.). Ponto Raynal 7240!

Widely distributed on warm shores from Europe and the Canary Is. to the eastern Mediterranean.

2. HALODULE

Endl., *Gen. Pl. Suppl.* 1: 1368 (1841); *den Hartog* in *Blumea* 12: 289-312 (1964).

Diplanthera *Thou.* (1806).

- 1.1. Rhizome creeping, with 2-5 roots and a short erect stem at each node; scales elliptic, 4-9 mm. long; sheaths 1.5-4 cm. long; 5-18 cm. long, about 0.5 mm. broad, with a conspicuous midrib sometimes ending in a very small tooth, intra-marginal veins inconspicuous both ending in a narrow triangular lateral tooth giving the leaf tip a bicuspidate appearance; male flowers pedunculate, anthers slender, one higher than the other, 4 mm. long; female flower with compressed elliptic ovary 1.5-2 mm. long, style 11-12 mm. long; fruit ovate, slightly compressed 2 mm. long with a very short rostrum [wrightii](#)

Halodule wrightii* *Aschers. in *Sitzungsber. Ges. Naturf. Fr., Berlin* 1868: 19, 24 (1869); *den Hartog* l.c. 304, figs. 6-8. *APD acc*

Diplanthera wrightii (*Aschers.*) *Aschers.* (1897)—*Feldmann* in *Bull. Soc. Hist. Nat. Afr. Nord* 29: 107-112, fig. 1 (1938); *Trochain* in *Mém. I.F.A.N.* 2: 108 (1940).

A slender marine aquatic herb growing in sand near low tide mark.

Maur.: Murat! **Sen.:** Nianing (Aug.) **Trochain!** Ponto Raynal 7242!

Also in Mauritania (Tanoudort) around the African coasts to the Persian Gulf, and in the Caribbean area.

NAJADACEAE

Small submerged annual water-plants; stem slender, much branched. Leaves small, subopposite or verticillate, sessile, with a sheathing base and linear entire or toothed blade. Flowers unisexual, monoecious or rarely dioecious, very small axillary, often enveloped in a bract (spathe) with 2-lobed apex. Male flower with 1 stamen; anther sessile, 1-4-locular. Bract (spathe) of female flowers sometimes very thin and adhering to the carpel. Ovary of 1 carpel, 1-locular, with 2-4 stigmas. Ovule solitary erect. Fruit usually embraced by the leaf-sheath, indehiscent. Seed without endosperm.

One genus, widely distributed in temperate and warm regions.

NAJAS

Linn., Sp. Pl. 1015 (1753); F.T.A. 8: 225, as *Naias*; Horn af Rantzien in Kew Bull. 7: 29-40 (1952).

Characters of the family.

- 1 Leaves conspicuously toothed (see also No. 2), strongly falcate, the teeth as long as or greater than the width of the leaf; leaf sheath truncate; only male flowers provided with bract (spathe); anther 4-locular [1. *pectinata*](#)
Leaves obscurely toothed: [2](#)
- 2 Leaf sheaths not auricled but irregularly fimbriate with at least 10 spines; leaf margin with 12-20 rather conspicuous teeth; both male and female flowers enclosed in spathes [2. *affinis*](#)
Leaf sheaths auricled; leaf margin teeth minute: [3](#)
- 3 Bract (spathe) present, enclosing either male or female flowers or both: [4](#)
Bract (spathe) absent from all flowers: [5](#)
- 4 Both male and female flowers enclosed in a bract (spathe), at anthesis male flower exerted from bract on 2 mm.-long pedicel, anthers 4-locular; leaf margin with (12-)16(-21) teeth on each side; fruits 2-2.5 mm. long [3. *meikleii*](#)
Only male flowers enclosed in a bract (spathe), anthers 1-locular; leaf margin with 35-45 teeth on each side ... [4. *hagerupii*](#)
- 5 Leaves with about 10 minute teeth; auricles generally bearing 3-5 inconspicuous spines; fruits 1.6-2.1 mm. long, with 20-25 rows of squarish markings [5. *liberiensis*](#)
Leaves with about 20 distinct teeth, often with leaf margin undulate; auricles with about 2 brownish spines at apex; fruits 2-2.5 mm. long, with about 50 rows of elongated markings [6. *baldwinii*](#)

The species are not as clear-cut as the key would suggest and in spite of Horn af Rantzlen's work much remains to be done to define the specific limits—if, indeed, this is possible in the traditional sense. Other aquatic plants have been shown to exhibit remarkable morphological variation according to the environmental conditions (moving or still water etc.) and in *Najas* even the floral characters appear to be of dubious taxonomic value.-F.N.H.

COMMELINACEAE

Perennial or annual herbs, often more or less succulent, mostly terrestrial, sometimes aquatic, frequently producing adventitious roots at the nodes; stems erect to prostrate, rarely somewhat climbing. Leaves alternate (falsely whorled in *Palisota*), with a basal membranous often nervose and closed sheath. Inflorescence composed of single or aggregated cincinni, terminal, lateral or axillary; sometimes each cincinnus may be reduced to single or (apparently) fascicled flowers. Flowers actinomorphic or zygomorphic, often surrounded by mucilage. Sepals 3, free, usually green or membranous. Petals 3 (one often smaller than the other 2), white or coloured, free or sometimes united below into a tube. Stamens hypogynous, basically 6 in two whorls, but variously modified or suppressed; fertile stamens 2, 3 or 6; staminodes 0, 3 (or rarely 4); filaments (with us) free, glabrous or with moniliform hairs; anthers dorsifixed or basifixed, 2-locular, dehiscent by longitudinal slits (or by basal pores in *Cyanotis*). Ovary superior, 2-3-locular, with a simple terminal style and a small more or less capitate stigma; ovules 1-6 (-10) per loculus, axile. Fruit usually a loculicidal capsule, sometimes partly or wholly indehiscent, or (in *Palisota*) a berry. Seeds usually crowded, with the contiguous faces flat, often muricate, ridged or reticulate, relatively large; the testa characteristically marked on the

outside with a circular or elliptic callosity called the embryostega (or embryotega), under which the embryo is situated; hilum punctiform or linear; endosperm abundant, mealy.

A medium-sized family of 500-600 species, widely distributed mainly in tropical and subtropical regions.

The leading features of the family are the leaf-sheaths, the inflorescence of cincinni, the separate calyx and corolla, and the embryostega on the seed. According to Mr. D. P. Stanfield, to whose observations on the family as a whole this account owes much, the family is "readily recognized by the involute margins of the young leaves, a characteristic feature of all the genera in West Tropical Africa except *Cyanotis*".

The frail flowers are usually fully open for a short time only—sometimes for but a few hours during the day—and closely related species may differ in the times at which their flowers are expanded.

- 1 Inflorescences each emerging through a hole at the base of the leaf-sheath, thus always borne laterally:2
 Inflorescences not perforating leaf-sheaths, axillary or terminal:4
- 2 Inflorescence on a peduncle 2-8 cm. long; flowers laxly arranged; seeds 4-8 per loculus[10. *Buforrestia*](#)
 Inflorescence sessile or nearly so; peduncle up to about 0.5 cm. long; seeds 1-2 per loculus:3
- 3 Bracts subtending flowers in inflorescence, small, up to about 0.5 cm. long, not strongly pointed; inflorescence bifurcate, with the branches elongating to about 3 cm. in length as they develop; petals pink, free . [2. *Forrestia*](#)
 Bracts subtending flowers in inflorescence, large, green, 1.5-2.5 cm. long, pointed; inflorescences appearing as dense leafy clusters at stem nodes; petals white, united below into a tube[8. *Coleotrype*](#)
- 4 Inflorescences not enclosed in or closely subtended by a spathaceous bract, usually paniculate and terminal, sometimes axillary and then occasionally each inflorescence with only one or a few flowers:5
 Inflorescence enclosed in or closely subtended by an often leafy spathaceous bract: 10
- 5 Fruit a loculicidal capsule:6
 Fruit indehiscent:9
- 6 Petals 3, equal:7
 Petals 3, unequal, the anticous (lower one) smaller than the others; fertile stamens 3, all anticous (lower); posticous stamens transformed into yellow bilobed staminodes; capsule usually 2-locular, rarely and inconstantly 3-locular[5. *Aneilema*](#)
- 7 Fertile stamens 6; staminodes 0; inflorescence usually more or less hairy, hairs frequently glandular:8
 Fertile stamens 3, alternating with 3 yellow hastate or trilobed staminodes; inflorescence glabrous [3. *Murdannia*](#)
- 8 Capsule 3-locular; seeds 2-10 per loculus; bracts subtending pedicels amplexicaul or perfoliate and more or less cupular[1. *Stanfieldiella*](#)
 Capsule 2-locular; seed 1 per loculus; bracts more or less narrowed at base, not amplexicaul or perfoliate[4. *Floscopa*](#)
- 9 Leaf-margins glabrous or nearly so; fruits hard, brittle, metallic blue-black or purplish, with many seeds [6. *Pollia*](#)
 Leaf-margins silky-hairy; fruit a more or less fleshy berry with 3 loculi and 2-3 seeds per loculus, never metallic blue[7. *Palisota*](#)
- 10 Fertile stamens 5-6, with densely and conspicuously bearded filaments; petals connate into a tube; bracts subtending individual flowers conspicuous and usually more or less falcate; inflorescences usually clustered, terminal axillary or lateral, rarely solitary[9. *Cyanotis*](#)
 Fertile stamens 3, with glabrous filaments; petals free; bracts subtending individual flowers 0 or very small and, inconspicuous: 11
- 11 Spathes sessile, arranged alternately along more or less elongate terminal and lateral axes which are covered with hooked hairs; spathes small, up to 15 mm. long; petals white[11. *Polyspatha*](#)
 Spathes usually pedunculate, sometimes almost sessile, usually solitary and leaf-opposed, sometimes appearing clustered or on a short lateral shoot; spathes often more than 15 mm. long; flowers usually blue or yellow, rarely white or another colour[12. *Commelina*](#)

***Dichorisandra thyrsiflora* Mikan**

From South America, is cultivated in Sierra Leone.

***Rhoeo spathacea* (Sw.) Stearn**

***R. discolor* (L'Hérit.) Hance**

From the West Indies, is often cultivated.

With sword-shaped, usually green and purple leaves and boat-shaped lateral inflorescences of white flowers subtended by paired leafy bracts.

***Zebrina pendula* Schnizl.**

From Tropical America, is also often grown for ornament.

A prostrate herb with ovate or elliptic usually more or less variegated or purple leaves and small pink flowers in close stalked heads, each head subtended, by 2 unequal leafy bracts.

1. STANFIELDIELLA

Brenan in Kew Bull. 14: 283 (1960).

Buforrestia C. B. Cl. (1881), (partly)-F.T.A. 8: 76; F.W.T.A., ed. 1, 2: 309.

- 1 Inflorescences terminal or more or less aggregated near tops of the erect or suberect flowering stems (lateral inflorescences may be present in addition); hairs on pedicels and outside of sepals (when present) 0.25-1 mm. long:2
 Inflorescences all lateral and scattered, not terminal or aggregated, near top of flowering stem; stems creeping; pedicels and outside of sepals pubescent with short hairs less than 0.25 mm. long; seeds with close low warts or short ridges4. *axillaris*
- 2 Seeds 4-10 per loculus, smooth or (in *S. oligantha*) verrucose; capsule much exceeding sepals:3
 Seeds 2-4 per loculus, verrucose; capsule not or scarcely exceeding sepals; leaf-sheaths densely spreading-villous outside; lamina rather densely appressed-hairy on both surfaces; inflorescence pubescent with gland-tipped hairs 0.25-0.5 mm. long3a. *brachycarpa* var. *hirsuta*
- 3 Terminal inflorescence or cluster of inflorescences usually 3-8 cm. wide; leaves not or scarcely aggregated into an apical rosette, usually up to about 13 cm. long and 4 cm. broad (rarely more), elliptic or narrowly elliptic, usually more or less long-ciliate on "petiole" and margin of lamina near base; outside of sepals and pedicels usually pubescent with gland-tipped hairs 0.5-1 mm. long; capsule 1.5-2 mm broad1. *imperforata*
 Terminal inflorescence or cluster of inflorescences small and compact, about 2-3 cm. long and wide; upper leaves mostly more or less aggregated into apical rosettes, similar to *S. imperforata* but sometimes (not always) larger, 10-16 cm. long; capsule 2.25-3 mm. broad2. *oligantha*

1. *Stanfieldiella imperforata* (C. B. Cl.) *Brenan* in Kew Bull. 14: 284 (1960); J. K. Morton in J. Linn. Soc. 60: 207 (1967). *APD acc*

Buforrestia imperforata C. B. Cl. in DC., Monogr. Phan. 3: 234, t. 7 (1881); F.T.A. 8: 76; F.W.T.A., ed. 1, 2: 309.

A herb with stems 5 in. to 2 ft. high, decumbent and stoloniferous below and rooting from lower nodes; leaves often more or less purplish beneath; flowers with small, white petals, open from about 11 .30 a.m. until noon; in lowland rain-forest.

3. MURDANNIA

Royle, Illustr. Bot. Himal. 403, t. 95, fig. 3 (1839); Brenan in Kew Bull. 7: 179 (1952). *APD acc*

Baoulia A. Chev. in Mém. Soc. Bot. Fr. 2, 8: 217 (1912).

Phaeneilema Brückn. in Engl., Bot. Jahrb. 61, Beibl. 137: 63 (1926).

Aneilema R. Br. (partly)-F.T.A. 8: 62; F.W.T.A., ed. 1, 2: 312.

- 1 Inflorescence normally with distinct lateral branches, cymose or paniculate; rarely (in No. 2) occasional inflorescences may be without lateral branches but are then subumbellately racemose with 3 or more flowers; staminodes normally 3 (-4): **2**
 Inflorescence unbranched, consisting of solitary or sometimes paired flowers arising from the axils of 1-3 of the uppermost leaves (bracts); plant slender, grass-like, with usually simple or subsimple stems, glabrous except for margins of sheaths and lower part of leaves; leaves linear-lanceolate, 2-5(-6) mm. wide; fertile stamens 3, with hairy filaments; staminodes 0 *3. tenuissima*
- 2 Erect, relatively robust herb about 15-60 cm. high; leaves long, the lower about 7-40 cm. long; axes of partial inflorescences (cincinni) in fruit elongating to about 0.5-2 (-3) cm. with usually close-set conspicuous scars left by the fallen pedicels; petals 5.5-7 mm. long, 4.5-7 mm. broad *1. simplex*
 Weak, prostrate or decumbent herb; leaves relatively short, the lower to 7 (-10) cm. long; axes of partial inflorescences (cincinni) in fruit 0.4-1 (-1.3) cm. long, with less closely spaced and less conspicuous scarring; petals about 3-3.5 mm. long, 2-5 mm. broad *2. nudiflora*

1. *Murdannia simplex* (Vahl) Brenan in Kew Bull. 7: 186 (1952); Saunders, Handb. W. Afr. Fl. 96 (1958); J. K. Morton in J. Linn. Soc. 60: 202 (1967). *APD acc*

Commelina simplex Vahl, Enum. 2: 177 (1806).

Also in the Congo, Uganda, Tanzania, Zambia and Angola.

4. FLOSCOPA

Lour., Fl. Cochinch. 192 (1790); F.T.A. 8: 84. *APD acc*

- 1 Inflorescence quite glabrous; seeds smooth, without ribs or conspicuous tubercles; leaves linear-lanceolate, 1.5-8 mm. broad [1. *leiothyrsa*](#)
 Inflorescence more or less pubescent or tomentose:.....2
- 2 Petals yellow; stems short, up to 20 cm. high, often branching from near base, rooting at base only; leaves lanceolate to linear-lanceolate, 2-8 mm. broad; inflorescence very shortly and inconspicuously pubescent with hairs up to 0.25 mm. long; seeds tuberculate [2. *flavida*](#)
 Petals blue or lilac or sometimes white; stems straggling or erect, rooting at base or from lower nodes as well, often exceeding 15 cm.; seeds with radial ridges or smooth, without conspicuous tubercles:.....3
- 3 Capsule 1.25-1.75 mm. broad; seeds 0.5-0.8 mm. long, 0.5-0.75 mm. broad, 12-14 (rarely -17)-ribbed; cincinni rather narrow and elongate; annual, 10-30 cm. high, rooting only at or near base; leaves not narrowed or falsely petiolate at base [3. *axillaris*](#)
 Capsule 2-3 mm. broad; seeds 1-1.5 mm. long, 0.75-1 mm. broad, 13-21-ribbed:.....4
- 4 Leaf-sheaths densely villous-pubescent all over outside; lamina elliptic, subacute or acute at apex, not at all acuminate; inflorescence lax, open, with main axis only about 1.5-3.5 cm. long, and relatively few branches [4. *mannii*](#)
 Leaf-sheaths usually ciliate on margins, otherwise glabrous or with an inconspicuous line of pubescence running longitudinally along the fused margins; lamina lanceolate or elliptic-lanceolate, more or less acutely acuminate at apex; inflorescence usually dense and many-flowered, with main axis usually exceeding 3.5 cm. in length, and usually with numerous branches:.....5
- 5 Leaves much narrowed at base into a more or less marked false petiole; inflorescence shortly and inconspicuously pubescent or puberulous; stems ascending, decumbent or creeping, rooting from lower nodes:6
 Leaves not at all narrowed at base, or if somewhat narrowed then without any false petiole:8
- 6 Pedicels of fruit 0.5-1.5 mm. long; sepals mostly 2-2.75 mm. long; style not or scarcely exerted beyond the sepals:.....7
 Pedicels of fruit 1.5-2 mm. long; sepals 3-4 mm. long; style exerted beyond the sepals, becoming reflexed; robust plant up to 1.2 m. high with a panicle 7-10 cm. long [5c. *africana* subsp. *majuscula*](#)
- 7 Stems erect, ascending or straggling, about 15-90 cm. high; plant with reddish-purple pigment particularly in stems, undersides of leaves and inflorescences; leaves with lamina usually four or more times as long as broad, 4-15 cm. long [5a. *africana* subsp. *africana*](#)
 Stems wholly low and creeping; flowering stems up to about 15-20 cm. high; plant lacking reddish-purple pigment; leaves with lamina up to about three times as long as broad, about 2.5-6 cm. long [5b. *africana* subsp. *petrophila*](#)
- 8 Capsule with stipe 0.5-1 mm. long, almost half as long as the body of the capsule; seeds with 20-23 clear radial ribs; plant erect, rooting only near base; lamina 8-15 cm. long, not narrowed at base; leaf-sheaths with a line of pubescence down the outside along the fused margins [6. *polypyleura*](#)
 Capsule with usually much shorter stipe up to 0.5(-0.75) mm. long, at most 1/4-1/3 as long as the body of the capsule; seeds usually with 11-18 (rarely to 21) radial ribs, rarely ribs obscure or absent:.....9

- 9 Leaves with lamina gradually narrowed towards the sheath, not at all petiolate nor amplexicaul, mostly 6.5-13 cm. long, 0.5-1.7 cm. broad; inflorescence usually dense and many-flowered, densely and shortly pubescent; seeds with 11-15 (-16) faint ribs [7. *confusa*](#)
- Leaves with lamina not narrowed towards the sheath, rounded and more or less amplexicaul at base; seeds usually with well-marked ribs, ribs rarely obscure or absent: **10**
- 10 Terminal inflorescence with few (up to about 5) branches or simple; indumentum on inflorescence sparse (if densely villous-pubescent, compare *F. glomerata*); plant creeping or straggling, often floating in water, rooting freely from lower nodes; lamina short, up to 7 cm. long; seeds with 16-21 radial ribs [8. *aquatica*](#)
- Terminal inflorescence usually with numerous (5 or more) branches and more or less densely villous-pubescent; seeds with 13-18(-30) radial ribs, rarely ribs obscure or absent; lamina up to 11 cm. long: **11**
- 11 Sepals more or less densely hairy with hairs of varying length, among which are rather numerous long flexuous hairs 0.75-2.5 mm. long; terminal cell of hairs usually enlarged; leaves mostly 10-17 mm. broad, but sometimes only 5 mm. broad [9a. *glomerata* subsp. *glomerata*](#)
- Sepals more or less densely hairy with short hairs 0.2-0.5 mm. long: **12**
- 12 Hairs on calyx with terminal cell not or scarcely enlarged in comparison with those below it; leaves mostly very narrow, 4-8 mm. broad, rarely more [9b. *glomerata* subsp. *pauciflora*](#)
- Hairs on calyx with terminal cell clearly enlarged in comparison with those below it, the hairs thus appearing glandular-capitate; leaves mostly 8-18 mm. broad [9c. *glomerata* subsp. *lelyi*](#)

1. ***Floscopa leiothyrsa* Brenan** in Kew Bull. 7: 206 (1952). *APD acc*

A probably annual herb, apparently erect, 8-10 in. high, subsimple to much branched; flowers pale violet, in few- to many-branched cymes; [in or near water or marshes](#).

Mali: Fetodie, nr. Dogo (Jan.) Davey 107!

Also in **Chad**, **Tanzania**, **Zambia** and **Botswana**.

[Immediately separable from all other species of *Floscopa* by the glabrous inflorescences.]

2. ***Floscopa flavida* C. B. Cl.** in DC., Monogr. Phan. 3: 269(1881); F.T.A. 8: 87; Berhaut, Fl. Sén. 210; Nielson, Introd. Fl. Pl. W. Trop. Afr. 184 (1965). *APD acc*

Small annual herb usually much branched from base 13/4-8 in. high; stem-leaves mostly short and less than 2 in. long, sometimes to 3 in.; sepals dark reddish-purple; petals yellow, differing thus from those of all other *Floscopa* species in our area.

Sen.: Elinkine, Bignona (Oct.) Adam 18275! Niokolo-Koba (Oct.) Adam 15891! **Port. G.:** Buruntuma (Dec.) Pereira 2160! **Guin.:** Youkounkoun (Oct.) Pitot! **Ghana:** Yendi to Zabzugu (Dec.) 4. ***Floscopa mannii* C. B. Cl.** in DC., Monogr. Phan. 3: 268 (1881); F.T.A. 8: 86; J. K. Morton l.c. (1967). *APD acc*

A low herb about 4-6 in. high; leaves with elliptic lamina 3-6.5 cm. long and 1.5-3 cm. wide. A very distinctive but little-known species, readily known by the combination of falsely petiolate leaves and densely pubescent leaf-sheaths; [probably in wet places in rain-forest](#).

S. Nig.: Oban Talbot 756!

Also in **Rio Muni**.

5. *Floscopa africana* (P. Beauv.) C. B. Cl. l.c. 267 (1881); F.T.A. 8: 85; J. K. Morton l.c. 199 (1967). *APD acc*

Aneilema africanum P. Beauv., Fl. Oware 2: 57, t. 93 (1818).

5a. *Floscopa africana* subsp. *africana* *APD acc*

An erect or straggling herb up to 3 ft. high, variable in robustness, often rooting at the nodes; leaves lanceolate, with a false petiole; flowers whitish or pale lilac; **in or near water, usually by rivers and streams.**

Gam.: Genieri (Feb.) Fox 73! **Port. G.:** Fá (Oct.) Guerra 3878! **Guin.:** Kounounkan valley (Oct.) Schnell 7619! **S. L.:** Musaia (Dec.) Deighton 4495! Rogbin, N. Prov. (Oct.) Glanville 49! [From Dahomey to E. Cameroun this is a very distinct taxon, but elsewhere it is not always so marked and the characteristic exerted style less obvious.-J.P.M.B.]

6. *Floscopa polypleura* Brenan in Kew Bull. 7: 207 (1952); J. K. Morton in J. Linn. Soc. 60: 201 (1967). *APD acc*

Erect or suberect, annual herb 8 in.-2 ft. 6 in. high; inflorescence glandular-pubescent; flowers lilac-purple or sometimes white; seeds with remarkably numerous (20-23) radial ribs; **in savanna.**

Ghana: Tamale to Lumbungu (Nov.) Morton A3787! Yendi (Nov.) Akpabla 478!

Also in **Tanzania** and **Zambia**.

7. *Floscopa confusa* Brenan in Kew Bull. 15: 225 (1961); J. K. Morton l.c. 200 (1967). *APD acc*

A coarse straggling herb about 2-6 ft. high, with stems rooting at lower nodes; leaves linear-lanceolate, leaf-sheaths ciliate at mouth, otherwise glabrous or sparsely pubescent along the connate margins;

flowers mauve, in densely and shortly pubescent panicles; seeds with very faint ribs; [in upland marshes or swamps](#).

N. Nig.: Mambila Plateau, Sardauna Prov. (Jan.) Hepper 1719! **S. Nig.:** Ikwette Plateau, Obudu Div. (Dec.) Savory & Keay FHI 25246!

Also in the **E. Cameroun**, **Congo** and **Uganda**.

[Related to *F. glomerata*.]

8. *Floscopa aquatica* *Hua* in Bull. Mus. Hist. Nat. Paris 1: 122 (1895); Brenan in Kew Bull. 15: 228 (1961); J. K. Morton in J. Linn. Soc. 60: 201 (1967). *APD acc*

Floscopa myosotoides* *Hutch., F.W.T.A., ed. 1, 2: 311 (1936), and in Kew Bull. 1939: 241; Brenan in Kew Bull. 7: 457 (1952).

Herb with creeping or floating stems 21/2-16 in. long, rooting freely from the nodes; leaves ovate to lanceolate, mostly 2-5 cm. long, thin, often wavy-margined, not or scarcely narrowed at base; sheaths short, glabrous; flowers whitish to lilac or blue, in rather small inflorescences; [often floating in river and rice-fields, sometimes creeping in swamps](#).

Extending to Chad.

9c. *Floscopa glomerata* subsp. *lelyi* (*Hutch.*) *Brenan* in Kew Bull. 22: 387 (1968). *APD acc*

Floscopa leyli Hutch., F.W.T.A., ed. 1, 2: 311 (1936), and in Kew Bull. 1939: 242 (1939).

Similar in habit and habitat, to subsp. *glomerata* but indumentum on inflorescence shorter.

S. L.: Ronietta (Nov.) Thomas 5528! **N. Nig.:** Kontagora, Niger Dist. (Dec.) Dalz. 270! Minna (Dec.) Meikle 730! Anara F.R., Zaria (Dec.) Meikle 75! Naraguta, Plateau Prov. (Nov.) Lely 704! Vogel Peak, Sardauna Prov. (Nov.) Hepper 1454! **S. Nig.:** Owo (Oct.) Stanfield 32! 138! Igarra (Dec.) Stanfield 74!

Also apparently in Brazil and Paraguay.

The specimens cited by C. B. Cl. in DC., Monogr. Phan. 3: 270 (1881) under typical *F. glabrata* Hassk. not seeming separable. The other varieties of *F. glabrata* may well represent different taxa.

Floscopa sp.

Annual herb 4-12 in. high. Rather similar to *F. axillaris*, with similar elongate cincinni up to 5 cm. long, but flowers and cymules larger, the latter 2-2.5 mm. across.

Sen.: Oussouye (Apr.) Berhaut 5844! Ziguinchor (Dec.) Berhaut 6698! Bignona (Dec.) Berhaut 6738! **Port. G.:** Nhampassare, Gabu (Oct.) Esp. Santo 3526!

Imperfectly known species.

5. ANEILEMA

R. Br., Prod. 290 (1810); F.T.A. 8: 33, excluding *Tricarpellria*; Brückner in E. & P., Pflanzenfam., ed. 2, 15A: 174 (1930); J.K. Morton in J. Linn. Soc. 60: 168 (1967). **APD acc**

- 1 Petals yellow; capsule truncate at apex with two rather projecting subacute corners like little horns; cells on surface of capsule isodiametric and projecting, giving a minutely papillose surface easily seen under a $\times 10$ lens; leaves ovate-lanceolate, ovate-oblong or ovate-elliptic, mostly 2-6.5 cm. broad; plant with hooked clinging hairs; inflorescence 1. aequinoctiale
 Petals white, pink, lilac or mauve; capsule rounded and often emarginate at apex, without projecting corners; cells on surface of capsule usually transversely elongate, wider than tall (except in *A. paludosum* where they are more or less isodiametric but scarcely projecting, so that the capsule-surface is shiny); leaves variable:2
- 2 Capsule with a single seed in each loculus; capsule usually about as wide as or wider than long:3
 Capsule with two or more seeds in each loculus; capsule longer than wide:9
- 3 Leaves mostly 2-4.5 cm. broad, ovate to elliptic-lanceolate, mostly narrowed, into a false petiole above the sheath; inflorescence dense, about 3-5 cm. long and 2-4 cm. broad, its axis puberulous, rarely with some longer hairs as well4. *dispermum*
 Leaves mostly less than 2 cm. broad, lanceolate to linear-lanceolate, mostly sessile on the sheath; inflorescence about 1-2.5 cm. broad:4
- 4 Capsule broader than long, usually emarginate; stems slender; plant annual with fibrous roots; seeds globose: ..5
 Capsule longer than broad, not emarginate; stems slender to stout; plant perennial with fusiform tuberous roots clustered at the rootstock; seeds longer than wide:7
- 5 Bracts on main inflorescence-axis elongate, linear, 5-7 mm. long, exceeding the flowers at least in bud; inflorescence all or at least the better-developed ones densely cylindrical, 2-4 cm. long, 1-1.5 cm. broad; sepals with projecting glands at apex; capsule very sparsely and shortly pubescent10. *mortonii*
 Bracts on main inflorescence-axis short, ovate, 1-3 mm. long, not exceeding the flowers or flower-buds; inflorescence capitate, rarely slightly elongate and 2-3 cm. long; sepals without projecting glands at apex; capsule more densely and longly pubescent:6
- 6 Inflorescences single or 1-2 together at ends of flowering shoots9a. *paludosum* subsp. *paludosum*
 Inflorescences several together near ends of flowering shoots which are thus much branched distally, small, few-flowered9b. *paludosum* subsp. *pauciflorum*
- 7 Stems slender, their internodes mostly exposed to near the inflorescence; no red bristly hairs; inflorescence 1.5-3 cm. long and about 1.5 cm. diam.; seeds more or less ellipsoid, about 2.5 mm. long and 1.25 mm. broad ..9c. *paludosum* subsp. *pseudolanceolatum*
 Stems stout, their internodes usually totally concealed in the upper part of the stem by the imbricate leaf-sheaths, occasionally partly exposed but then stems and sheaths with spreading red bristly hairs; inflorescence about 2-4 cm. long and 1.5-2.5 cm. broad; seeds ellipsoid, about 4 mm. long and 2 mm. broad:8
- 8 Leaf-sheaths with dark rusty-red spreading bristly hairs outside and on margins8a. *setiferum* var. *setiferum*

Leaf-sheaths with colourless bristly hairs usually on margins only, sometimes outside also [8b. setiferum var. pallidiciliatum](#)

- 9 Stems erect or suberect from a basal rootstock with fusiform tubers; leaves lanceolate to linear; savanna species: **10**

Stems straggling to creeping, or with erect branches, producing fibrous roots from the lower nodes; but without fusiform tubers at the rootstock; leaves lanceolate to elliptic or ovate; mostly forest species, rarely in savanna: **12**

- 10 Leaves increasing markedly in length towards the base of the stem where there is a rosette of linear-lanceolate leaves (6-)15-25(-30) cm. long which are tapered below into false petioles; leaf-margins ciliate with more or less spreading conical hairs; flowers opening after mid-day [7. pomeridianum](#)

Leaves on stem more or less uniform in length except that the lamina becomes reduced or absent towards base of stem; basal rosette thus absent; leaf-margins closely and minutely cartilaginous-serrate; flowers opening in the morning: **11**

- 11 Flowers usually produced with the leaves which are then mostly more than 5 cm. long and 8 mm. broad; inflorescence mostly 1.5-5 cm. diam., its axis usually not deep purple or blue [6a. lanceolatum subsp. lanceolatum](#)

Flowers usually produced before the leaves develop fully (at flowering time leaves up to about 5 cm. long and 6-8 mm. broad, later elongating to about 13 cm. but still as narrow); inflorescence often narrower than in 6a, its axis often deep purple or blue [6b. lanceolatum subsp. subnudum](#)

- 12 Inflorescence a more or less lax open panicle; leaves ovate to elliptic, usually with distinct false petioles: **13**

Inflorescence dense, subcapitate to ovoid: **14**

- 13 Leaf-sheaths usually with some rusty-red (sometimes colourless) spreading bristly hairs on margins and outside surface; inflorescence-branches (4-)8-31; leaves up to 13 cm. long and 4 cm. broad [2a. umbrosum subsp. umbrosum](#)

Leaf-sheaths without rusty-red hairs; sometimes a few colourless cilia on margins but not on outside surface which is puberulous; inflorescence-branches 2-8; leaves mostly up to 8 cm. long, 3 cm. broad (rarely 10 cm. long and 4 cm. broad) [2b. umbrosum subsp. ovato-oblongum](#)

- 14 Inflorescence small, 1-2 cm. long and wide; capsule with distinct acumen at apex; leaves elliptic to lanceolate, up to about 7 cm. long and 2.5 cm. broad; ciliate on margins, with a distinct false petiole [5. silvaticum](#)

Inflorescence larger, more than 2 cm. long; capsule rounded, subtruncate or minutely apiculate at apex; leaves not ciliate on margins, falsely petiolate or not: **15**

- 15 Leaves linear to lanceolate, usually without a petiole; fusiform tubers always present at rootstock, but the stems may straggle and root at lower nodes; capsule with short spreading pubescence outside; a savanna species (see also above) [6a. lanceolatum subsp. lanceolatum](#)

Leaves lanceolate to elliptic or ovate, more or less clearly falsely petiolate, up to about 24 cm. long and 6 cm. broad; no fusiform tubers; roots all fibrous; capsule glabrous; a forest species [3. beniniense](#)

1. **Aneilema aequinoctiale** (*P. Beauv.*) *Kunth* Enum. 4: 72 (1843); C. B. Cl. in DC., Monogr. Phan. 3: 221 (1881), partly, excl. vars. minor and kirki; F.T.A. 8: 65; Chev. Bot. 666, at least partly; Irvine, Pl. Gold Coast 30 (1930); Nielsen, Introd. Fl. Pl. W. Afr. 183 (1965); J. K. Morton in J. Linn. Soc. 59: 443, fig. 4 (1966). *APD acc*

Commelina aequinoctialis *P. Beauv.*, Fl. Oware 1: 65, t. 38 (1806-9).

A scrambling or sometimes erect robust herb up to 6 ft. high or more, clothed with clinging hairs; flowers bright or orange-yellow, opening about 7-10 a.m.; in forest, often secondary; said sometimes to be a weed in farmland.

Lib.: Harley 1205! Peahtah (Oct.) Linder 1010! Ganta (Feb.) Harley 906! Nimba (June) Adam 21580! **Ghana:** Kumasi (Oct.) Darko 349! Agogo (Jan.) Irvine 877! Ampam, Kwahu. (Dec.) Morton 5031! Widespread in the rain-forest regions of tropical Africa.

[Morton in J. Linn. Soc. 59: 466 (1966) distinguishes 1: subsp. *beniniense*, with more or less pubescent or ciliate leaf-sheaths, rather small inflorescences of pinkish-mauve flowers, and truncate to slightly emarginate capsules with pale brown seeds; and 2: subsp. *sessilifolium* (Benth.) J. K. Morton, with puberulous rarely slightly ciliate leaf-sheaths, broader leaves, larger inflorescences of white flowers, and apiculate capsules with whitish-scaly seeds. The latter subspecies is said to be common from Ghana to Cameroun. I have not found it possible to distinguish clearly between these two taxa in the herbarium.

The more recently described subsp. *leonense* J. K. Morton in J. Linn. Soc. 60: 169, t. 1 (1967) from Sierra Leone, with rather large leaves inflorescences and capsules, and an indumentum of short hooked hairs, seems to need further consideration before it is accepted-J.P.M.B.]

4. ***Aneilema dispernum* Brenan** in Kew Bull. 7: 198 (1952); J. K. Morton in J. Linn. Soc. 59: 445 (1966). *APD acc*

A straggling herb up to about 2 1/2 ft. high with dense ovoid-oblong inflorescences; flowers white in W. Africa but said to be bluish or pinkish elsewhere; **in montane forest.**

W. Cam.: Cam. Mt., 4,500-6,500 ft. (Nov.-Mar.) Morton K694! GC 6726! Migeod 31! Breteler et al. MC 286! **F. Po:** Monod 10422!

Also in **Tanzania** and **Malawi**.

5. ***Aneilema silvaticum* Brenan** in Kew Bull. 7: 203 (1952) (var. *silvaticum*); J. K. Morton l.c. 459 (1966). *APD acc*

***Aneilema affine* De Wild.** in Bull. Jard. Bot. Brux. 5: 83 (1915), not of R. Br. (1810).

A slender, straggling herb with fibrous roots at the lower nodes and ascending flowering stems up to about 1 ft. high; flowers white or very pale blue.

S. Nig.: Kennedy 2674! Sapoba Kennedy 1758a! Sapoba to Agbadi (Nov.) Meikle 637!

Also in **E. Cameroun** and the **Congo**.

[The variety in our area is typical var. *silvaticum* resembling a miniature *A. beniniense* but with ciliate-margined leaves and acuminate capsules.]

6. ***Aneilema lanceolatum* Benth.** in Fl. Nigrit. 546 (1849); C. B. Cl. in DC., Monogr. Phan. 3: 227 (1881); F.T.A. 8: 72, partly; Irvine, Pl. Gold Coast 30 (1930); F.W.T.A., ed. 1, 2: 314; Nielsen, Introd. Fl. Pl. W. Afr. 183 (1965); J. K. Morton l.c. 453 (1966), *APD acc*

6a. ***Aneilema lanceolatum* subsp. *lanceolatum*-J. K. Morton** in J. Linn. Soc. 59: 453, fig. 8 (1966). *APD acc*

***Aneilema lanceolatum* var. *evolutius* C. B. Cl.** (as "evolutior") l.c. (1881), partly, excl. lectotype.

***Aneilema schweinfurthii* C. B. Cl.** l.c. (1881); F.T.A. 8: 71; Chev. Bot. 667.

***Aneilema soudanicum* C. B. Cl.** in F.T.A. 8: 72 (1901).

***Aneilema lanceolatum* var. *lanceolatum*-Brenan** in Kew Bull. 7: 202 (1952), partly, excl. syn. *Lamprothyros gracilis*, *Aneilema gracile*, *A. subnudum*.

***Aneilema lanceolatum* var. *pilosum* Brenan** in Kew Bull. 15: 219 (1961).

A variable perennial herb with fusiform tuberous roots at the rootstock and erect ascending or prostrate stems up to about 3 ft. long; flowers mauve, opening in the morning, from 7 .30 a.m. to noon; **in savanna-woodland and grassland.**

7. PALISOTA

Reichb. ex Endl., Gen. Pl. 125 (1836); F.T.A. 8: 27. Nom. cons. *APD acc*

- 1 Plants with a distinct aerial main stem, sometimes short and 15-100 cm. high, sometimes branched and up to 5(-6) m. high:[2](#)
Plants without a distinct aerial main stem; rosettes of leaves at ground-level:[7](#)
- 2 Inflorescence lax, elongate, 10-30 cm. long, with rather slender lateral peduncles usually about 1-2 cm. long; stems up to about 6 m. high, somewhat branched, with leaves mostly in terminal rosettes; leaves oblanceolate to obovate, 15-30(-40) cm. long, 4-11.5 cm. wide, more or less long-hairy near base, particularly on margins; inflorescences often several per rosette[1. hirsuta](#)
Inflorescence either dense, up to 15(-20) cm. long, or lax, but then only 4-10 cm. long and normally 1 per rosette:[3](#)
- 3 Inflorescence rather lax and narrow, 3-10 cm. long, with lateral peduncles very short, 0-3 mm. long; flower-bearing part of each partial inflorescence at first very short, becoming elongate in fruit, 5-30 mm. long, and thickened; inflorescence puberulous; stems up to about 2 m. high, often branched, with leaves mostly in

- rosettes; leaves obovate to oblanceolate or elliptic, 12-23 cm. long, 4-10 cm. broad; petiole short, up to 2.5 cm.; inflorescence normally 1 per rosette [2. *ambigua*](#)
- Inflorescence dense: **4**
- 4** Leaves scattered along the upper part of the stem, not whorled; petiole 1-2.5 cm. long; lamina, elliptic to oblong-elliptic, 13-27 cm. long, 4.5-7 cm. broad; stems slender, about 3-5 mm. diam.; inflorescence solitary, terminal, about 5-9 cm. long and 1.5-2 cm. broad [3. *preussiana*](#)
- Leaves mostly whorled in rosettes; petiole 2-30 cm. long; stems stouter, mostly 5 mm. or more in diameter; inflorescences solitary to several per rosette: **5**
- 5** Inflorescence short, about 2-2 1/2 times as long as broad; stem about 15-100 cm. tall; leaf-lamina elliptic to somewhat ovate or obovate, 12-50 cm. long, 5-18 cm. broad, narrowed at base to a distinct petiole about 2.5-30 cm. long [8. *barteri*](#)
- Inflorescence elongate, about 4-7 times as long as broad: **6**
- 6** Petioles short, 1-8 cm. long; peduncles 2-6 cm. long; leaf-lamina usually elliptic to oblong-elliptic, 15-40 cm. long, 4-15.5 cm. broad; inflorescence about 6-15 cm. long and 1.5-3.5 cm. broad [4. *schweinfurthii*](#)
- Petioles long, 10-33 cm. long; peduncles about 8-15 cm. long; leaf-lamina mostly about 40-100 cm. long, 13-21 cm. broad; inflorescence about 7-19 cm. long and 1.5-4 cm. broad [5. *mannii*](#)
- 7** Peduncle of inflorescence and inflorescence itself (except for flowers) completely covered with very long dense silky-woolly hairs; lamina 15-36 cm. long, 8-12 cm. broad, obovate-oblanceolate, tomentose beneath; petiole about 5-7 cm. long; inflorescence about 2.5-5 cm. long and 2-2.5 cm. broad [6. *lagopus*](#)
- Peduncle of inflorescence not or scarcely tomentose; inflorescence (except sometimes for bract-margins) not tomentose; lamina not or scarcely tomentose beneath: **8**
- 8** Inflorescence with conspicuous ovate bracts about 5-10 mm. broad subtending each lateral branch and projecting among the flowers; bracts long-ciliate; leaf-lamina elliptic to oblanceolate or narrowly obovate, about 25-40 cm. long and 5.5-14 cm. broad, often with a pale stripe along the midrib, gradually cuneate at base, almost sessile or with a petiole up to 25 cm. long; inflorescence about 4-8(-18) cm. long and 1.5-4 cm. broad; fruits pilose, beaked [7. *bracteosa*](#)
- Inflorescence with inconspicuous lanceolate to linear bracts mostly 2-3 mm. broad or less: **9**
- 9** Inflorescence about 4-8 times as long as broad, about 10-23 cm. long and 2-4 cm. broad, in fruit up to 50 cm. long and 10 cm. broad; leaf-lamina about 60-110 cm. long and 11-34 cm. broad, tapering at base (sometimes rather abruptly) into a petiole 20-30 cm. long; fruits glabrous or nearly so (in our area) [5. *mannii*](#)
- Inflorescence about 1 1/2-2 times as long as broad, about 2-9 cm. long and 1.5-4 cm. broad; leaf-lamina about 20-60 cm. long and 6-12 cm. broad, gradually narrowing to the petiole which is sometimes short and indistinct sometimes up to 25 cm. long; fruits hairy, beaked [8. *barteri*](#)

(May) Onoce FHI 32919! **W. Cam.:** Buea (Apr.) Hamblen 182! Victoria (Dec.) Ndi FHI 50345! S. Bakundu F.R., Kumba (Jan.) Binuyo & Daramola FHI 35054! Above Buea (Mar.) Morton GC 6714! **F. Po:** Mann 94! (June) Barter! (fr. Sept.) Melville 454! Balea Mt. (Dec.) Guinea 384!

Also in **E. Cameroun** and **Congo**.

The above-cited specimens are all typical stemless *P. barteri*. Occasionally stems up to c. 120 cm. long are developed. The taxonomic status of such plants is doubtful. Examples are: *S. L.*: Tingi Hills (Dec.) Morton & Gledhill SL 3020! *S. Nig.*: Usonigbe F.R., Benin (Nov.) Keay FHI 125580! 25625! Okomu F.R., Benin (Dec., Feb.) E. W. Jones in Hb. Brenan 8606! Brenan 9019!

[The Liberia and Ghana specimens, with larger leaves more rounded at base than usual, may prove to be taxonomically separable.]

- Palisota staudtii** K. Schum. in Engl., Bot. Jahrb. 24: 346 (1897).

APD: *Synonym of Palisota barteri* Hook.

W. Cam.: Victoria to Bimbisa (fl. Apr., May), Preuss 1157; 1229

It may well be a synonym of *P. barteri* as suggested in Ed. 1. The very slender pedicels up to 1 cm. long seem unusual, however—J.P.M.B.]

Uncertain species.

Palisota bicolor Mast. in Gard. Chron., n.s. 9: 527 (1878); C. B. Cl. in DC., Monogr. Phan. 3: 134 (1881); F.T.A. 8: 32. *APD acc*

Stem abbreviated; petiole 7.5-10 cm. long; lamina 30-35 cm. long; midrib brown-woolly-pubescent beneath; flowers and fruits not described.

Described from a plant cultivated by Messrs. Veitch, originally from Fernando Po.

Imperfectly known species.

Palisota sp.

Stems 6 ft. long, straggling; infructescence lax, stout 14 cm. long; [in dense forest.](#)

Ghana: Pusopuso ravine, Asiakwa (fr. Feb.) Morton A3864!

[Resembling *P. hirsuta* (Thunb.) K. Schum., but fruiting pedicels 5-6 mm. long (1-3 mm. in *P. hirsuta*). Near to and possibly conspecific with *P. pedicellata* K. Schum. from B. Tomé. More material needed.]

8. COLEOTRYPE

C. B. Cl. in DC., Monogr. Phan. 3: 238 (1881). *APD acc*

- 1 A rather robust straggling herb, often producing aerial roots from the lower nodes, with vegetative parts almost glabrous except for short hairs on margins of leaves and sheaths; leaves elliptic, 9-20 cm. long, 3-6.5 cm. broad, not at all rosetted, very acuminate at apex, gradually tapering to a short false petiole at base; inflorescences piercing the leaf-sheaths, appearing as dense sessile clusters of conspicuous green leafy bracts mixed with white flowers; the clusters about 1.5-3 cm. long and broad, mainly at the lower nodes or even at ground-level [laurentii](#)

Coleotrype laurentii K. Schum. in Engl., Bot. Jahrb, 33: 377 (1903); Brenan in Kew Bull. 7: 456 (1952); Aké Assi Contrib. 2: 222, t. 19 (1964); J. K. Morton in J. Linn. Soc. 60: 171, fig. 1 (1967). *APD acc*

A straggling herb with stems up to about 6 ft. long and 4 ft. high, often stoloniferous, with compact clusters of white flowers and green bracts sessile on the stem; flowers open from about 11 a.m. to 3 p.m.; [in rain-forest, sometimes abundant where clearing has taken place.](#)

Iv. C.: Divo Forest (Oct.) Aké Assi 5410! **Ghana:** Mampong (Dec., Jan.) Morton GC 9676! A1543! Mpraeso Scarp (Oct.) Hall GC 65! **S. Nig.:** Akure F.R. (Aug.) Tamajong FHI 19516! Owo (fl. & fr. Also in [the Congo](#) and [Uganda](#).

9. CYANOTIS

D. Don, Prod. Fl. Nepal. 45 (1825); F.T.A. 8: 78. Nom. cons. *APD acc*

- 1 Plant with a bulb-like thickened basal stock, or with tuberously thickened roots, or with the stem abruptly thickened and corm-like (but then also producing fibrous roots from stem-nodes above the corm); plants always perennial, with usually more or less erect stems: **2**
 Plant producing only fibrous roots (bulbs, corms and tuberously thickened roots absent, but beware specimens of *C. barbata* showing only fibrous roots, whose corm has been left behind in the ground!; these are accounted for in the key): **10**
- 2 Outer bract of each cincinnus (partial inflorescence) or cluster of cincinni not or only slightly exceeding them; base of stem covered by the persistent leaf-bases which are themselves clothed with long silky hairs; tuberously thickened roots radiating from stem-base; leaves in a radical rosette, up to 21 cm. long and 3-5 cm. broad; flowering stems often produced before the radical leaves expand, the stems themselves without developed leaves but with scales or small bracts, ending in an irregular inflorescence of several small mostly pedunculate cincinni, mostly borne separately (i.e. singly) [5. caespitosa](#)
 Outer bract of each cincinnus (if borne singly) or cluster of cincinni clearly exceeding them: **3**
- 3 Plant with a conspicuously enlarged bulb-like base 1.5-3 cm. across whose scales are the persistent papery leaf-bases, more or less clothed with long straight silky hairs; leaves mostly radical, linear, up to 20 cm. long, 2-7 mm. broad; stems usually with 1-2 reduced leaves and irregular inflorescence of pedunculate cincinni borne separately and singly [6. angusta](#)
 Plant without a bulb-like base, either with a small corm (tuberously thickened stem) below ground-level or with tuberously thickened roots only: **4**
- 4 Plant with a pea-like corm about 1-1.5 cm. diam., below ground-level; fibrous roots produced from nodes above the corm; no radical rosette of leaves; leaves linear, up to about 8 cm. long; stems more or less spreading-pilose above; individual cincinni sessile or subsessile, normally in terminal or axillary clusters of 2 or more together, with more or less falcate outer leafy bracts [7. barbata](#)
 Plant without a corm but with tuberously thickened roots radiating from stem-base; a radical rosette of leaves usually present, their sheaths often with long straight silky hairs: **5**

- 5 Stems very short, 5-10 cm. high; cincinni 1-5 per stem, borne singly and pedunculate, each cincinnus with 1 outer leafy bract; radical leaves up to 5 cm. long and 7 mm. broad; stem leaves 0 or very reduced:6
 Stems 15-100 cm. high; cincinni normally sessile and clustered 2 or more together in terminal or axillary heads; heads mostly 1.5-3 cm. diam., usually with 2 or more leafy bracts; leaves 5-22 cm. long, 0.3-2.5 cm. broad; cauline leaves well developed:7
- 6 Cincinni (including bract) up to about 1.1 cm. long; bracteoles and sepals glabrous [3. scaberula](#)
 Cincinni (including bract) about 1.5-2.7 cm. long; bracteoles and sepals hairy [4. lourensis](#)
- 7 Leaves (0.1-1)-0.4-1.8 cm. broad, the lowest leaves mostly 10-20 cm. long, the upper ones decreasing in length; lamina not or scarcely amplexicaul at base; radical rosette usually present 1. longifolia8
@
 Leaves 2-2.5 cm. broad (the bracts slightly narrower), the lowest leaves 7-9 cm. long, the upper scarcely shorter; lamina amplexicaul at junction with sheath; no radical rosette [2. ake-assii](#)
- 8 Leaves mostly 3-20 mm. broad; plant usually tall, 30-100 cm. high:9
 Leaves 1-3 mm. broad; plant slender, 7-50 cm. high [1c. longifolia var. rupicola](#)
- 9 Plant robust; leaves mostly 8-20 mm. broad; sepals generally with a dorsal longitudinal line of pubescence .. [1a. longifolia var. longifolia](#)
 Plant more slender; leaves 3-8 mm. broad; sepals pubescent all over back [1b. longifolia var. gracilis](#)
- 10 Bracts on stems subtending cincinni ovate, 1-1.5 cm. broad above base, about 1.5-3 cm. long; plant densely spreading-hairy; cincinni all sessile, single, or clustered near ends; plant apparently perennial [9. hepperi](#)
 Bracts on stems subtending cincinni linear to lanceolate, usually less than 1 cm. broad (if, very rarely, as broad as above, then bracts much longer than 3 cm., plant without spreading hairs and annual): 11
- 11 Cincinni in clusters of 2 or more together, mostly sessile or nearly so; clusters usually with 3 or more leafy bracts; plant annual (C. lanata): 12
 Cincinni mostly single, sometimes paired at end of stem; plant; apparently perennial (certainly so in C. arachnoidea): 13
- 12 Heads of cincinni (other than terminal one) some at least usually pedunculate; bracteoles mostly subacutely pointed; occurring between 6,000 and 12,000 ft. altitude [7. barbata](#)
 Heads of cincinni (other than terminal one) almost always sessile; bracteoles acute; below 5,000 ft. altitude .. [11. lanata](#)
- 13 Cincinni (including bract) 1.5-2.5 cm. long, on peduncles 1.5-5.5 cm. long; leaves linear, 2-4.5 mm. broad ... [8. ganganeñsis](#)
 Cincinni (including bract) 0.5-1.5 cm. long, those other than the falsely pedunculate terminal ones mostly sessile, occasionally pedunculate; leaves mostly more than 4.5 mm. broad: 14
- 14 Plant perennial: 15
 Plant annual [11. lanata](#)
- 15 Plant more or less silky or cottony, but not spreading-hairy [10a. arachnoidea var. arachnoidea](#)
 Plant densely spreading-hairy [10b. arachnoidea var. pilosa](#)

1. **Cyanotis longifolia Benth.** in Fl. Nigrit. 543 (1849); F.T.A. 8: 81; Brenan in Kew Bull. 7: 205 (1952); Schnell in Bull. I.F.A.N. 19, Sér. A: 729 (1957); J. K. Morton in J. Linn. Soc. 60: 195 (1967). **APD acc**

APD: *Synonym of Cyanotis lanata Benth.*

1a. **Cyanotis longifolia var. longifolia APD acc**

Cyanotis djurensis C. B. Cl. in DC., Monogr. Phan. 3: 256 (1881); F.T.A. 8: 83; F.W.T.A., ed. 1, 2: 317.

Widespread in the savana regions of tropical Africa.

A very variable plant particularly in its indumentum: sometimes it is almost glabrous, usually more or less grey-cottony, sometimes with spreading hairs, or rarely densely velvety-hairy all over (Adames 309, Guinée, Fouta Djallon, near Labé airport; Morton SL 2643, Sierra Leone, Bintimani).

1b. *Cyanotis longifolia* var. *gracilis* (Schnell) Schnell in Bull. I.F.A.N. 19, Sér. A: 733 (1957); J. K. Morton in J. Linn. Soc. 60: 197 (1967). *APD acc*

Cyanotis lamata **Benth.** var. *gracilis* **Schnell** in Bev. Gén. Bot. 57: 287 (1950).

A perennial herb similar to var. *longifolia* but more slender, up to 21/2 ft. high, more or less densely grey-cottony; **in savanna, particularly where damp.**

Cyanotis longifolia var. *maliensis* **Schnell** in Bull. I.F.A.N. 19, Sér. A: 736 (1957); J. K. Morton l.c. (1967).

Cyanotis longifolia var. *fonensis* **Schnell** in Bull. I.F.A.N. 19, Sér. A: 737 (1957).

A perennial herb similar to var. *gracilis* but even more slender and narrower-leaved, and not so tall.

Guin.: Fouta Djallon (Sept.) Schnell 7089! Nimba Mts. (Aug.) Schnell 6213! Massif de Fon (Aug.) Schnell 6601! **S. L.:** Kponkporto to Wala, Koinadugn Dist. (July) Marmo 299! Sakasakala, Zambia Dist. (Sept.) Deighton 5158!

2. *Cyanotis ake-assii* Brenan in Kew Bull. 22: 389 (1968). *APD acc*

A perennial herb with rather stout hairy stems about 21/2 ft. long and densely clustered thickened roots; leaves rather broad, with more or less grey-cottony hair on both surfaces.

Mali: Bamako, Baguinedi (Aug.) Roberty 2663! 64 km. W. of Ségou (Aug.) Roberty 3769! **IV. C.:** Boundiali to Korhogo (July) Aké Assi 5440!

3. *Cyanotis scaberula* Hutch. in Kew Bull. 1939: 243; F.W.T.A., ed. 1, 2: 317 (1936), English descr. only; Schell in Bull. I.F.A.N. 19, Sér. A: 749 (1957). *APD acc*

A perennial herb about 4 in. high with tubarously thickened roots.

Guin.: Kouroussa Pobéguin 268! 368!

4. *Cyanotis lourensis* Schnell Bull. I.F.A.N. 19, Sér. A: 744 (1957); J. K. Morton in J. Linn. Soc. 60: 194 (1967). *APD acc*

A perennial herb 1-4 in. high, with tuberously thickened roots, rose-purple flowers, blue or violet staminal hairs and yellow anthers; similar to the last but with larger hairier cincinni and probably wider leaves; the leaves are all radical and appear to be purplish, at least when dry; **in shallow poor gravelly soil, seasonally moist, near bare rocks.**

Guin.: Mt. Loura, Fouta Djallon, 4,800 ft. (Sept.) Schnell 7126! Misside Banga, Pita (July) Adames 298!

5. *Cyanotis caespitosa* *Kotschy & Peyr.* Pl. Tinn. 48 (1867); F.T.A. 8: 82; Schnell in Bull. I.F.A.N. 19, Sér. A: 748 (1957); J. K. Morton l.c. 192, fig. 7 (1967). *APD acc*

A perennial herb with a stout hairy base and purple flowering stems 11/2-12 in. high; flowers normally blue (occasionally lilac, purple or even white) with blue staminal hairs and yellow anthers; in grassland, often flowering after fires.

7. *Cyanotis barbata* *D. Don* Prodr. Fl. Nepal. 46 (1825); J. K. Morton in J. Linn. Soc. 60: 198 (1967).

APD: *Synonym of Cyanotis vaga (Lour.) Schult. & Schult. f.*

Cyanotis vaga of Merr. in Trans. Amer. Phil. Soc., n.s. 24, 2: 102 (1935), partly; Rao in Notes R.B.G. Edinb. 25: 186 (1964), partly, as to syn.

Cyanotis barbata *Don*, prob. not of (Lour.) Schult. & Schult. f. (1830). *Cyanotis hirsuta*. Fisch. & Mey., Ind. Hort. Sem. Petrop. 8: 57 (1842), nomen subnudum; F.T.A. 8: 78.

Cyanotis mannii *C. B. Cl.* in DC., Monogr. Phan. 3: 258 (1881); F.T.A. 8: 83; F.W.T.A., ed. 1, 2: 317.

A perennial herb 2-18 in. high, variable in appearance, with normally blue, rarely mauve or white flowers; in our area the stems and sheaths are more or less spreading-pilose. Differs from *C. angusta* in its slender stem at ground-level, only swollen below the surface of the soil. In grassland at high altitudes.

Ghana: Wudidi, Togo Plateau (Nov.) Morton A3448! **W. Cam.:** Cam. Mt., 7,000-12,000 ft. (Nov.-Jan.) Mann 1310! N2140! Johnston 34! Deistel 79! Morton K776! Maitland 1286! Bamenda, 6,500 ft. (Jan.) Migeod 417! **F. Po:** Clarence Peak, 9,000 ft. (Dec.) Mann 616!

Also in **Congo, Sudan, Ethiopia, Uganda, Kenya, Tanzania, Malawi** and **Rhodesia**; extending also along the Himalayas from India to China.

[Merrill's adoption, followed by Rao, of *C. vaga* as the correct name of this species seems unjustified because no type-specimen appears extant, the original description does not agree very well with *C. barbata*, and it seems unlikely that Loureiro could have found true *C. barbata*, only known at high altitudes in China, near Canton, the type-locality of *C. vaga*.]

8. *Cyanotis ganganensis* *Schnell* in Bull. I.F.A.N. 19, Sér. A: 746 (1957); J. K. Morton l.c. 199 (1967). *APD acc*

A herb-with stems 8-16 in. long, with narrow leaves scattered along the stems and not in a basal rosette, and blue to pink flowers in falcate cincinni, the latter borne singly on peduncles.

Guin.: Gangan Mt., Kindia (Oct.) Schnell 7487! Pita, Fouta, Djallon (Sept.) Adames 367! Kinkou to Pita (Oct.) Pilot!

9. *Cyanotis hepperi* *Brenan* in Kew Bull. 22: 390 (1968). *APD acc*

A densely spreading-hairy, apparently perennial herb with leaves up to 9 cm. long and 1-2 cm. wide in basal clusters and erect or straggling stems up to 18 in. long; hairs on stamen-filaments white; **in rock crevices in upland savanna.**

N. Nig.: Vogel Peak Massif, above Gurum, 4,700 ft. (Nov.) Hepper 1360!

10. **Cyanotis arachnoidea** *C. B. Cl.* in DC., Monogr. Phan. 3: 250 (1881); J. K. Morton in J. Linn. Soc. 60: 194, t. 2, 1 (1967). *APD acc*

10a. **Cyanotis arachnoidea var. arachnoidea** *APD acc*

A perennial, succulent, much branched, prostrate herb, with stems up to about 1 1/2 ft. long forming loose mats on rocks, more or less clothed with white indumentum like silk or cotton-wool; flowers pink to mauve, open from 7-10 a.m.

Lib.: Sinoe Dinklage 2138! **Ghana:** Aboma F.R., Ashanti, 1,000 ft. (Nov.) Vigne 3440! Atonso, Ashanti (Oct.) Baldwin 13496! **S. Nig.:** Mt. Orosun, Idanre (Oct.) Keay FHI 22584! Akure W.R., Ondo (Dec.) Morton K956! Okelife, Ondo, 1,200 ft. (Nov.) Onochie FHI 34217! Igarra, Owo (Oct.) Stanfield 30! Oba, Owo (Nov.) Stanfield 48! Owo (June) Stanfield 97!

Also in **Kenya, Tanzania, India** and ? **Ceylon.**

Similar in appearance to *C. lanata* but perennial, with the cincinni frequently borne singly, and with the leaf-sheaths usually larger and more overlapping.

- 10b. **Cyanotis arachnoidea var. pilosa** *Brenan* in Kew Bull. 22: 389 (1968). *APD acc*

Similar to var. *arachnoidea* but stems, leaves bracts and peduncles densely spreading-hairy.

S. Nig.: Oba, Owo (June) Stanfield 98! Owo F.R. (July) Onochie FHI 3335!, partly!

11. **Cyanotis lanata** *Benth.* in Fl. Nigrit. 542 (1849); F.T.A. 8: 80; Sousa in Anais Junta Inv. Col. 7: 63 (1952); Schnell in Bull. I.F.A.N. 19, Sér. A: 789 (1957); Berhaut, Fl. Sén. 209; J. K. Morton in J. Linn. Soc. 60: 194 (1967). *APD acc*

APD: Synonym of Cyanotis longifolia Benth. var. longifolia

Cyanotis lanata var. schweinfurthii *C. B. Cl.* in DC., Monogr. Phan. 3: 258 (1881); Sousa l.c. 5: 48 (1950).

Widely distributed in tropical Africa, reaching as far S. as the Transvaal.

[The plant is variable in its indumentum from more or less densely grey-cottony to subglabrous or glabrous. Chev. 22196 (Iv.C., Nzi Valley, Tiébissou to Languira) appears to be an unusual variant with spreading hairs. Certain Ghana gatherings (e.g. Agomenda to Somanya Adams 4386; Bole to Wa Rose Innes in Herb. Dept. Agric. 345; Tumu Irvine 4705), also Iv.C., Séguéla Aké Assi 6578, have few-flowered often single cincinni and may represent a distinct taxon.]

10. BUFORRESTIA

C. B. Cl. in DC., Monogr. Phan. 3: 233 (1881); F.T.A. 8: 76 partly; Brenan in Kew Bull. 14: 280-281(1960). *APD acc*

- 1 Stems up to about 1-1.2 m. high; leaf-sheaths about 2-3 cm. long, glabrous to very shortly ciliate on margins; leaf-lamina elliptic, broadest about middle, 12-30 cm. long, 5-11 cm. broad, tapering above into a conspicuous narrow acuminate about 1.5-3 cm. long; inflorescence-axes glabrous, about 6-15 cm. long, bearing 2-4 clusters of flowers (more if bifurcate); sepals in fruit about 1.5 cm. long; petals small; seeds rather closely and coarsely warted [1. mannii](#)

Stems about 10-35 cm. high; leaf-sheaths about 1.5 cm. long, more densely and conspicuously ciliate on margins than above; leaf-lamina obovate, broadest in upper part, rather abruptly narrowed above to a very short point about 2-7 mm. long, not or scarcely acuminate; inflorescence-axes pubescent, about 2-4 cm. long, bearing 1 cluster of flowers and 1(-2) lower bracts without flowers; otherwise similar to above [2. obovata](#)

1. **Buforrestia mannii** **C. B. Cl.** in DC., Monogr. Phan. 3: 233, t. 6 (1881); F.T.A. 8: 76; Brenan in Kew Bull. 14: 283, fig. 1, 1-10 (1960), partly, excluding Linder 561; Aké Assi, Contrib. 2: 222 (1964), partly, excluding Linder 561; J. K. Morton in J. Linn. Soc. 60: 169 (1967). *APD acc*

APD: *Synonym of Buforrestia obovata Brenan*

A stout herb about 1 1/2-5 ft. high with acuminate leaves and lateral inflorescence-axes each emerging through a hole at the base of the leaf-sheath; flowers small, white, open from 10 a.m. until 3 p.m.; **in lowland rain-forest.**

S. Nig.: Aponmu, Akure Dist. (July) Olorunfemi FHI 34155! Akure F.R. (Mar.) Richards 5134! Owo (July, Nov.) Stanfield 45! 103! Ifon (Dec.) Stanfield 51! Oban F.R., Calabar (Jan.) 11. POLYSPATHA

Benth. in Fl. Nigrit. 543 (1849); F.T.A. 8: 61. *APD acc*

- 1 Inflorescence-axes (i.e. those bearing spathes) elongate, at least the longer ones on each stem 6-20 cm. long; leaves glabrous or almost so, rarely shortly pubescent on surface but not long-pilose, elliptic or subrhombic-elliptic, cuneate at base, acutely more or less acuminate at apex, the larger ones 7-20 cm. long, 3-7 cm. broad; inflorescence usually of several flexuose axes apparently terminally clustered but sometimes single, leafless but

bearing small recurved spathes about their own distance apart; vigorous plants with some axillary inflorescence-axes in addition which perforate the leaf-sheaths; capsule 4-5 mm. long; seeds 2.5-3 mm. long, with ribs radiating from embryostega [1. paniculata](#)

Inflorescence-axes (i.e. those bearing spathes) all short, about 1.5-4 cm. long; leaves more or less scattered-long-pilose on upper surface, glabrous or sparsely pilose below, elliptic or oblong-elliptic, cuneate at base, gradually and acutely acuminate at apex, the larger ones 6-13 cm. long, 2-4(-4.5) cm. broad; inflorescence a short dense apparently terminal cluster of axes bearing spathes more or less as above but about half to three-quarters their own distance apart; capsule about 3 mm. long; seeds 2-2.5 mm. long, more or less faintly ribbed [2. hirsuta](#)

12. COMMELINA

Linn., Sp. Pl. 40 (1753); F.T.A. 8: 33. *APD acc*

- 1 Spathe-margins free to base: **2**
 Spathe-margins more or less connate at base above insertion of peduncle; spathe sometimes forming a wide funnel-shaped tube: **13**
- 2 Leaves linear, 1-5(-7) mm. broad, mostly 3-15 cm. long; plant annual, subsimple to much branched, 10-60 cm. high, producing fibrous roots from lowest nodes; spathes small, 5-15 mm. long, sessile or subsessile (peduncle to 5 mm.), deflexed; flowers apricot to buff, rarely blue; seeds with 2-5 coarse, deep, irregular furrows radiating from the embryostega on the side opposite the hilum [6. subulata](#)
 Leaves ovate to lanceolate, rarely linear but then spathes more than 2 cm. long, on peduncles 2-5 cm. long, and flowers blue: **3**
- 3 Flowers yellow: **4**

- Flowers blue, violet or white:9
- 4 Spathes borne singly, not clustered; plant glabrous to hairy, very rarely with rusty hairs; transverse nerves on leaves and spathes obscure or absent in dried specimens; capsule with dorsal loculus developed but indehiscent and with one seed; ventral loculi each with 2 ovules, one or both of which usually abort; seeds smooth or minutely reticulate; lamina lanceolate, sessile or subsessile on the sheath (*C. africana*):5
- Spathes more or less clustered at ends of stems; rusty marginal hairs usually present round spathes and/or mouths of leaf-sheaths, occasionally absent; transverse nerves on leaves and spathes usually conspicuous in dried specimens; capsule with dorsal loculus absent; ventral loculi each developing 2 seeds; seeds large, pale, elongate, conspicuously and deeply pitted; lamina elliptic-lanceolate or oblanceolate, asymmetric at base, often with a short distinct petiole [7. capitata](#)
- 5 Leaves glabrous or almost so (some long marginal hairs normally present near mouth of leaf-sheath):6
- Leaves more or less densely pubescent:8
- 6 Leaves normally up to 6(-7) cm. long or less; spathes mostly about 1.5-3.5 times as long as broad:7
- Leaves (at least larger ones) normally 7-13 cm. long; spathes about 1.5-5 times as long as broad, often (by no means always) more acuminate than above [1c. africana var. lancispatha](#)
- 7 Base of leaves rounded to rounded-cuneate; if cordate then leaves more than 4 cm. long [1a. africana var. africana](#)
- Base of leaves cordate; leaves up to 4 cm. long, ovate, sessile [1b. africana var. mannii](#)
- 8 Leaves normally up to 7 cm. long or less [1d. africana var. villosior](#)
- Leaves (at least larger ones) normally 7-13 cm. long [1e. africana var. boehmiana](#)
- 9 Plant, particularly stems, sheaths and spathes, more or less densely pubescent with colourless hairs hooked at tip, scandent; spathes on divergent peduncles on special mostly lateral shoots bearing mostly leafless sheaths; spathes not or scarcely acuminate; flowers blue; capsule with dorsal loculus developed, 1-seeded, indehiscent, ventral loculi with 2 ovules of which 1 or both often abort; seeds elongate, coarsely ridged [4. ascendens](#)
- Plant without hooked hairs, erect, straggling or prostrate; spathes not on special more or less leafless lateral shoots, usually acuminate: 10
- 10 Spathes 4-9 times as long as broad, elongate, 2.5-6.3 cm. long, narrow, 4-8 mm. broad (folded), gradually long-acuminate; stems not rooting from lower nodes above base; leaves linear-lanceolate, 5-16 cm. long, 5-11 (-15) mm. broad, glabrous or subglabrous; seeds large, elongate, reticulate, covered with white powder [5. macrospatha](#)
- Spathes 2-4 times as long as broad, often more than 10 mm. broad (folded); stems usually rooting freely from lower nodes above base; leaves often (not always) more than 11 mm. broad and shorter in proportion to width, seeds not covered with white powder: 11
- 11 Seeds smooth: 12
- Seeds reticulate; prostrate or straggling plant up to 1.2 m. high; lamina lanceolate to elliptic, rarely more than 8 cm. long; spathes 1.5-3 cm. long; flowers blue to violet; capsule 5-seeded [2a. diffusa subsp. diffusa](#)
- 12 Leaves lanceolate to linear-lanceolate, gradually attenuate-acute at apex, mostly 4-11 cm. long, 1-1.8 cm. broad; spathes acuminate, mostly 2.5-5 cm. long; flowers whitish to very pale violet; leaf-sheaths often more or less spreading-hairy all over outside [3. thomasi](#)
- Leaves ovate-elliptic, obtuse to acute, not attenuate at apex, 1.5-4.5(-5) cm. long, 1-1.6(-2) cm. broad; spathes not or scarcely acuminate, 1.2-2.3 cm. long; flowers pale or bright blue; leaf-sheaths pubescent on margins and on a longitudinal line opposite insertion of lamina, sometimes all over [2b. diffusa subsp. montana](#)
- 13 Leaves about 2-6 times as long as broad, lanceolate, elliptic, oblong-elliptic, ovate or ovate-elliptic: 14
- Leaves about 9-10 times or more as long as broad, linear to linear-lanceolate: 31
- 14 Flowers white to yellow; species of high forest except for *C. congesta* and *C. bracteosa*, (very rare albino variants): 15
- Flowers blue: 20
- 15 Flowers yellow; spathes more or less clustered at ends of stems; rusty marginal hairs usually present round spathes and/or mouths of leaf-sheaths, occasionally absent; capsule with dorsal loculus absent; ventral loculi each developing 2 large, pale, elongate, conspicuously and deeply pitted seeds [7. capitata](#)
- Flowers white: 16
- 16 Leaves obovate, distinctly ((0.5-)1-3 cm.) petiolate, up to about 18 cm. long and 7 cm. broad; stems decumbent, rooting at nodes; spathes clustered and imbricate at ends of stems [8. longicapsa](#)
- Leaves of various shapes but never obovate, always broadest at or below middle, sessile or with a very short petiole up to about 5 mm. long: 17
- 17 Leaf-sheaths rusty-hairy; lamina elliptic-lanceolate to ovate-lanceolate, acuminate at apex, 4-12 cm. long, 1-7-4 cm. broad; spathes sessile or subsessile, clustered 1-3 together at or near ends of stems; capsule with 2 loculi each containing 1 smooth ellipsoid seed [19. cameroonensis](#)

- Leaf-sheaths without rusty hairs:..... **18**
- 18** Seeds reticulate-pitted, large, about 4 mm. long and 2.5 mm. broad; stems stiff, slender, not rooting at nodes; leaves ovate-elliptic, acute at apex, asymmetric at base with one side rounded and the other cuneate; spathes mostly single, sometimes more than one together, on short bracteate shoots among upper leaves; spathes semicircular or semicordate, about 10-17 mm. long, not or scarcely acuminate; capsule with 2 single-seeded loculi [18. macrosperma](#)
- Seeds smooth or nearly so; capsule normally with 3 single-seeded loculi; stems often rooting at nodes:..... **19**
- 19** Spathes sessile and imbricate in terminal clusters, each spathe with margins connate for some distance, thus more or less obliquely funnel-shaped or triangular in outline; leaf-sheaths often spreading-hairy; flowers very pale blue or violet, almost white [20. congesta](#)
- Spathes more or less pedunculate, solitary or several together, more or less semicircular in outline; flowers normally bright blue, very rarely and casually white [16. bracteosa](#)
- 20** Leaf-margins rather strongly undulate, at least when dry, cartilaginous; lamina oblong-elliptic, rarely exceeding 7 cm. long and 1.7 cm. broad, usually obtuse to subacute, occasionally acute but never much tapering at apex; spathes small, about 8-13 mm. long, not or scarcely acuminate, borne singly and shortly pedunculate; cleistogamous flowers on basal underground shoots present, but rusty hairs on leaf-sheaths quite absent [10. forskalaei](#)
- Leaf-margins not or scarcely undulate (occasionally more or less undulate in *C. petersii*, but then leaves normally longer than 7 cm. and spathes longer than 2 cm.; also in *C. erecta* subsp. *maritima* where spathes are usually more than 1.5 cm. long and seeds are laterally ridged); leaves (other than those towards base of stem) acute to very acute at apex; cleistogamous flowers absent except in *C. benghalensis* which has rusty hairs at least on the margins of the leaf-sheaths:..... **21**
- 21** Seeds rough with coarse more or less reticulate ridges or transverse wrinkles on the side opposite the hilum; leaf-sheaths (at least on margins) usually with more or less elongate red or rusty hairs; cleistogamous flowers often present on short underground stems; leaves ovate to ovate-lanceolate; spathes usually more or less clustered: **22**
- Seeds smooth, at most faintly and shallowly reticulate, or sometimes with a low ridge on either side but otherwise smooth; red or rusty hairs and cleistogamous flowers absent: **24**
- 22** Spathes on peduncles 1.5-3.5 cm. long, the spathes themselves 2-3 cm. long; rusty hairs on leaf-sheaths and cleistogamous flowers absent [13. petersii](#)
- Spathes sessile or subsessile (peduncles to about 7 mm. long); spathes usually less than 2 cm. long; rusty hairs usually present on leaf-sheaths; cleistogamous flowers often present:..... **23**
- 23** Leaves narrowed but not or scarcely attenuate to the acute to subacute apex; leaf-sheaths rusty-ciliate on margins, with sometimes a few rusty hairs on surface outside [9a. benghalensis var. benghalensis](#)
- Leaves more or less gradually attenuate-acute at apex; leaf-sheaths more or less densely rusty-hairy all over outside [9b. benghalensis var. hirsuta](#)
- 24** Spathes pedunculate: **25**
- Spathes sessile or subsessile, usually more or less congested: **29**
- 25** Laminae (at least on some of the upper leaves) amplexicaul, sessile on the leaf-sheath and clasping the stem by a rounded base; spathes shortly pubescent outside, 2-3 cm. long, on peduncles 1.5-4 cm. long; peduncle of lower cincinnus normally projecting 1-2 cm. beyond spathe; capsule bilocular, each loculus with 2 ellipsoid-oblong seeds [12. imberbis](#)
- Laminae not amplexicaul, usually very shortly petiolate above the sheath, which itself may bear small green auricles distinct from the lamina; loculi 1-2-seeded:..... **26**
- 26** Capsule (4-)5-seeded, ventral loculi each 2-seeded; seeds ellipsoid to subglobose, usually very shallowly reticulate, without lateral ridges; plant robust with more or less erect stems; leaves often 10-16 cm. long and 2.5-4.5(-5.5) cm. broad; spathes 1.7-3.4 cm. long, not or scarcely acuminate, on peduncles (1-)1.5-3.5(-5) cm. long [11. zambesica](#)
- Capsule 2-3-seeded, ventral loculi each 1-seeded; seeds not reticulate, often with lateral ridges; peduncle of spathe 0.5-1.2 cm. long:..... **27**
- 27** Seeds globose or nearly so, without lateral ridges:..... **28**
- Seeds ellipsoid to subglobose, with a lateral ridge on each side below the embryostega; ridge sometimes continuous round the seed; spathes often (not always) more or less acuminate at apex [21. erecta aggregate \(see note on Berhaut 897\)](#)
- 28** Leaves small, up to about 6 cm. long, ovate to ovate-lanceolate, often rounded at base; stems prostrate, up to 1 m. long, rooting at nodes; sheaths spreading-hairy or pubescent outside; peduncles 5-10 mm. long [17. lagosensis](#)
- Leaves much larger, 5-13 cm. long, ovate-lanceolate to lanceolate, often cuneate at base; stems erect or straggling, normally not rooting freely at nodes; indumentum of leaf-sheaths variable; peduncles 8-22 mm. long [16. bracteosa](#)
- 29** Seeds smooth, without 2 lateral or 1 peripheral thickened ridge, ellipsoid; stems rooting at nodes; leaf-sheaths often more or less clothed with long soft spreading hairs, without spreading green auricles at mouth; flowers

- very pale violet, almost white [20. congesta](#)
- Seeds with 2 lateral or 1 peripheral thickened ridge, ellipsoid to subglobose; stems often not rooting at nodes; leaf-sheaths without long soft spreading hairs except a few on margins, often with small spreading green auricles at mouth; flowers bright blue: **30**
- 30** Leaves mostly about 4-8 times as long as broad, not markedly fleshy, often cuneate at base into a short petiole; plant straggling to erect [21a. erecta subsp. erecta](#)
- Leaves mostly about 2-3 times as long as broad, fleshy, mostly sessile or almost so on the sheath; plant prostrate, almost glabrous [21b. erecta subsp. maritima](#)
- 31** Flowers white to yellow or orange or deep purple, not blue: **32**
- Flowers blue: **35**
- 32** Spathes large, 2.8-3.8 cm. long, 1.5-2 cm. deep (folded), on peduncles 4-7 cm. long; stems to 1 m. long, straggling and rooting at nodes; leaves to about 12 cm. long and 1.2 cm. broad; flowers deep purple . [14. sp. B](#)
- Spathes smaller, not more than 1.5 cm. long and 1 cm. deep, on peduncles not exceeding 1.5 cm. in length; flowers white, yellow or orange: **33**
- 33** Spathes scattered singly at nodes, not more than 1-3 on each stem or branch; peduncles, usually short but distinct, 0.5-1.5 cm. long; spathes usually abruptly narrowed at base into the peduncle: **34**
- Spathes in terminal clusters of usually more than 3; peduncles up to about 5 mm. long; spathes narrowed at base into a pale funnel-shaped, part tapering into the peduncle; capsule with 3 single-seeded loculi; seeds subglobose, smooth [23. aspera](#)
- 34** Seeds ellipsoid, smooth except for 2 prominent pits on the side opposite the hilum, and usually some tiny scattered paler tubercles; loculi of capsule single-seeded [22a. nigritana var. nigritana](#)
- Seeds subglobose, reticulate; loculi (partly at least) 2-seeded [23b. nigritana var. gambiae](#)
- 35** Spathes single on each stem (rarely 2 at separate nodes), terminal, (1.5-)2-3-3 cm. long, on a peduncle (1-)2-4 cm. long; leaves more or less amplexicaul at base and with rather revolute margins [15. schweinfurthii](#)
- Spathes usually clustered several together, sometimes single, subsessile or shortly (to 1 cm.) pedunculate; leaves not markedly amplexicaul at base (though sometimes auriculate at sheath-mouth) and with involute not revolute margins [21c. erecta subsp. livingstonii](#)

Also in **E. Cameroun, Chad, Congo, Uganda, Tanzania, Zambia, Rhodesia, Angola**, and **S.W. Africa**.

[Broader-leaved variants occur in south tropical Africa but not (so far) in our area.]

1. *Commelina* sp. *APD acc*

A perennial, apparently erect herb about 20 cm. high; leaves linear, 8-17 cm. long, 7-10 mm. broad, more or less spreading-hairy at least on margins; sheaths more or less hairy; spathes spreading-hairy, conspicuously purple-veined, 1.5-4.5 cm. long, 1-1.5 cm. deep, on peduncles 4-12 cm. long; capsule probably 4-seeded.

Guin.: Kinkou (June) Adam 14677!

[Very close to *C. carsonii* C. B. Cl. from southern tropical Africa, to which it is referred by Morton in J. Linn. Soc. 60: 179 (1967), but more robust; also close to the east African *C. elgonensis* Bullock, which may not be specifically distinct from *C. carsonii*.]

Imperfectly known species.

2. *Commelina pilosissima* Hutch., F.W.T.A., ed. 1, 2: 320 (1936), described only in English.

APD: *Synonym of Commelina livingstonei C.B. Clarke*

A perennial herb with stems about 50 cm. long and linear leaves up to about 15 cm. long and 1 cm. broad; the whole plant densely hairy, very like *C. erecta* subsp. *livingstonii* of which it may well be only a variant. It also somewhat resembles *C. schweinfurthii* except for being densely hairy and having peduncles c. 5-7 mm. long. It has not been refound.

Iv. C.: Sassandra valley, Orodougou, between Siflé and Séguéla (June) Chev. 21826!

FLAGELLARIACEAE

Erect or climbing. Leaves sometimes ending in a tendril; leaf-sheath embracing the stem, closed. Flowers hermaphrodite or dioecious, in terminal panicles. Perianth persistent, segments 6, 2-seriately imbricate, dry or somewhat petaloid. Stamens 6; anthers 2-locular, introrse, opening lengthwise by slits. Ovary superior, 3-locular; style 3-lobed. Ovules solitary in each loculus, spreading or pendulous from the central axis. Fruit indehiscent, fleshy or drupaceous. Seeds with copious endosperm.

Tropics and subtropics of Old World.

FLAGELLARIA

Linn., Sp. Pl. 333 (1753); F.T.A. 8: 90.

Flowers hermaphrodite; perianth subpetaloid, 2-seriate, the outer shorter; stamens 6; ovary 3-celled, with a solitary ovule in, each cell; fruit a small berry.

- 1 A tall herbaceous climber; branches covered by the encircling leaf-sheaths, the latter deeply split on one side, glabrous, 1.5-3 cm. long; leaves linear-lanceolate, sessile on the sheath, with a slender tendriform tip, 10-20 cm. long, 1.5-3 cm. broad, many- and closely-nerved, glabrous; flowers numerous, in a terminal panicle 6-10 cm. long; perianth-segments in 2 series, the outer half as long as the inner, subpetaloid; stamens 6, exerted; ovary glabrous, trigonous; fruit subglobose, mucronate, about 6 mm. diam., bright red *guineensis*

Flagellaria guineensis *Schumach.* in Schum. & Thonn., Beskr. Guin. Pl. 181 (1827); F.T.A. 8: 90; Chev. Bot. 672. *APD acc*

A tough herbaceous forest climber, usually near rivers; flowers small, yellow or white; fruits red in dense clusters.

In tropical Africa generally, especially in coastal forest, to Natal.

XYRIDACEAE

Perennial or annual herbs. Leaves mostly radical, tufted, linear, terete or filiform, sheathing at the base. Flowers hermaphrodite, slightly zygomorphic, arranged in pedunculate terminal globose or cylindrical heads; bracts imbricate, leathery or rigid, the lower sometimes forming an involucre. Sepals 3 or rarely 2, the lateral 2 exterior, boat-shaped, keeled, glumaceous, the third interior, membranous, forming a hood over the corolla and pushed aside as the latter develops. Corolla with a short or long tube and 3 equal spreading lobes. Stamens 3, opposite the corolla-lobes, and 3 alternate staminodes or the latter absent; anthers 2-locular, opening by slits. Ovary superior, 1-locular, with 3 parietal placentas or imperfectly 3-locular at the base; style simple or 3-lobed. Ovules numerous to few. Fruit a capsule enclosed in the persistent, corolla-tube. Seeds numerous, with copious endosperm and small embryo.

Warm regions; in saline and freshwater marshes and seepage areas.

XYRIS

Linn., Sp. Pl. 42 (1753); F.T.A. 8: 7.

- 1 Bracts acutely mucronate, scabrid; lateral sepals with ciliate keel and spinous apex; perennials:.....2
 Bracts at most acute, usually obtuse or emarginate:5
- 2 Outer (lower) bracts larger than the inner bracts, up to 2 cm. long, broadly lanceolate, lacinate on margins, median nerve extending as a spine, reflexed on fruiting; inflorescence many-flowered, at first spherical, about 1 cm. diam. extending to nearly 2 cm. in fruit; leaves up to 60 cm. long, 3-6 mm. broad, stiffly acute at apex (Fig. 334/F) [1. leonensis](#)
 Outer bracts not markedly different from inner ones, nearly orbicular, entire; keel of lateral sepals ciliate:3
- 3 Inflorescence spherical, less than 1 cm. diam.; flowers about 1 cm. diam.:4
 Inflorescence elongated (see also below) [4. hildebrandtii](#)
- 4 Leaf-bases abruptly broadened, half-width about 1 cm., shining dark brown forming a thick tuft, lamina up to 60 cm. long, 2-3 mm. broad, finely acute at apex; inflorescence nearly 1 cm. diam., not elongating markedly in fruit; bracts 4 mm. diam., with a median keel extending as a short (0.5 mm.) spine [2. rehmannii](#)
 Leaf-bases narrow, half-width 2-3 mm., pale brown or reddish with hyaline margin forming a light tuft, lamina up to 30 cm. long, 1.5-2 mm. broad, curved, acute; inflorescence 4-7 mm. diam.; bracts 3 mm. diam., outer bracts finely mucronate, inner bracts with a horny apex and more or less mucronate [3. barteri](#)
- 5 Inflorescences elongated up to 15 mm. long and 7 mm. broad (rather larger in fruit), closely imbricated with numerous closely imbricated bracts; bracts all similar, sometimes minutely mucronate, nearly orbicular, 3 mm. diam., margin entire; keel of lateral sepals ciliate, the whole length; peduncle terete, up to 80 cm. long; leaves 2 mm. broad, in the fresh state flat on one side and convex on the other (Fig. 334/D) [4. hildebrandtii](#)
 Inflorescences more or less spherical, at least not elongated:.....6
- 6 Peduncle flattened and 2-edged or almost winged, without ribs between the edges; annuals; (see also note after No. 7):7
 Peduncle terete (sometimes more or less ridged or angular):8
- 7 Leaves and margins of peduncles not rugulose; bracts pale greenish yellow (at length pale brown), suborbicular, with membranous margins and a hardened greenish keel or triangle towards the apex; lateral sepals hyaline, broadly oblanceolate, with a sharp hyaline entire glabrous keel; inflorescence 5-8 mm. long; leaves 2-4 mm. broad and up to 24 cm. long (Fig. 334/C) [5. anceps](#)
 Leaves and usually margins of peduncles markedly rugulose; bracts reddish brown, occasionally pale brown, suborbicular, entire margins, green patch at apex very small and linear or absent; keel of lateral sepals smooth, entire; inflorescence 3-5 cm. long; leaves 1-2 mm. broad, 1-8 cm. long [6. rubella](#)
- 8 Keel of lateral sepals quite smooth and entire:9
 Keel of lateral sepals ciliate or serrulate:..... 10
- 9 Bracts chestnut shining brown, almost opaque, orbicular-obovate, obtuse, scarcely keeled; inflorescences 4-8 (-10) mm. long, (3-)5-8 mm. broad (up to 14 mm. in fruit); peduncle up to 70 cm. long, usually stout 1-2 mm. diam. and terete (sometimes compressed and 1 mm. diam., see note); leaves up to 20 cm. long, 2-4 mm. broad, broadly sheathing at the base [7. capensis](#)
 Bracts transparent or translucent and tinged pink or brown, elliptic-oblong, acute, not keeled; inflorescences 3-6 mm. long, 2-3 mm. broad; peduncle up to 30 cm. long, usually about 15 cm., very slender 0.5 mm. or less diam.; leaves 3-8(-12) cm. long, 1-2.5 mm. broad, sometimes minutely transversely rugulose when dry (Fig. 334/A) [8. straminea](#)
- 10 The keel of lateral sepals ciliate or ciliate: 11
 The keel of lateral sepals serrulate: 13
- 11 Lowland annual; leaves 6-11 cm. long, 2-3 mm. broad, minutely transversely rugulose when dry; peduncles very slender, 10-42 cm. long; inflorescences obovate, 3-6 mm. long, bracts chestnut brown, horny with a linear rough area towards the apex; lateral sepals hyaline, ciliate on the keel at least towards the apex . [9. filiformis](#)
 Highland perennials with bulbous base; inflorescences more or less spherical, 6-7 mm. diam.:..... 12
- 12 Bracts dark brown, thin with recurved margins, rather prominently keeled, apex usually emarginate; keel of lateral sepals ciliate at least in the lower 2/3; peduncles 17-50 cm. long; leaves 13-32 cm. long, 2-3 mm. broad [10. sp. near obscura](#)
 Bracts pale brown to straw-coloured, thin with recurved margins, not keeled, apex rounded; keel of lateral sepals long-ciliate; peduncles about 45 cm. long, minutely rugulose; leaves about 30 cm. long and 2 mm. broad [11. sp. A.](#)
- 13 Leaves (2)3-6 mm. broad, up to 50 cm. long, not shiny at the base; peduncles stout, strongly angular-ribbed, up

to 75 cm. long; inflorescences about 1 cm. diam.; bracts broadly obovate-orbicular, about 5 mm. long, brown with an elliptic median green patch, margins slightly jagged (Fig. 334/B) [12. *decipiens*](#)

Leaves 1 min. broad, 5-35 cm. long, greatly expanded at the base and shiny brown; peduncles slender, more or less angular; inflorescences 9 mm. long, 3-5 mm. broad; bracts about 5 mm. long, brownish, with small triangular patch towards apex, margins entire becoming broken (Fig. 334/E) [13. *festucifolia*](#)

1. ***Xyris leonensis* Hepper** in Kew Bull. 21: 422, fig. 2, 1-8 (1968).

APD: Synonym of Xyris aristata N.E. Br.

Stout tufted herb with large aristate outer bracts.

Guin.: Ditinn (Feb.) des Abbayes 858! **S. L.:** Bintumane Peak, 5,400 ft. (Dec., Jan.) T. S. Jones 90! Morton SL 408! **Lib.:** Nimba Reserve (fr. Feb.) Adam 20882! **iv. C.:** Sifé (Aug., Sept.) Aké Assi 6173! 7022! Séguéla (Oct.) Aké Assi 6180! **Ghana:** Ejura (Dec.) Morton GC 9705!

2. ***Xyris rehmannii* Nilss.** in Kongl. Svensk Vet. Akad. Handl. 24, No. 14: 28 (1892); Hepper in Kew Bull. 21: 424 (1968). *APD acc*

***Xyris dispar* N. E. Br.** in F.T.A. 8: 12 (1901).

Perennial herb forming large tufts with peduncles 1 1/2-2 ft. high; flowers bright yellow; bracts very dark brown; **sometimes abundant in upland wet places.**

N. Nig.: Nguroje, Mambila Plateau (Jan.) Hepper 1758! **W. Cam.:** Oku to Kumbo (= Bansa) (Feb.) Hepper 2018!

Also in **Rhodesia** and **Transvaal**.

3. ***Xyris barteri* N. E. Br.** in F.T.A. 8: 22 (1901). *APD acc*

***Xyris ledermannii* Malme** (1912).

Erect perennial herb 1-2 ft. high, the terete peduncles with only one ridge; flowers rather large, yellow, bracts chestnut brown; **in permanently wet places.**

Guin.: Kala Plateau, Fouta Djallon (Nov.) des Abbayes 860! **N. Nig.:** Bida (Jan.) Meikle 1014! Nupe Barter! Kontagora (Nov.) Dalz. 255! Vom, 4,000 ft. (Oct.) Hepper 1154!

4. ***Xyris hildebrandtii* Nilss.** in Öfvers. Vet. Akad. Förhandl. Stockh. 1891: 155; F.T.A. 8: 24; Perrier de la Bathie, Fl. Madag. 35: 10, fig. 2, 8-11 (1946); Hepper in Kew Bull. 21: 421 (1968).

APD: Synonym of Xyris congensis Büttner

A massively tufted perennial herb with peduncles 2 1/2-3 1/2 ft. high; flowers bright yellow, bracts dark brown in an elongated head; **dominant in open wet depressions in upland.**

N. Nig.: Kakara, Mambila Plateau, 4,900 ft. (fl. & fr. Jan.) Hepper 1771! **W. Cam.:** Oku to Kumbo (= Bansa), 6,000 ft. Hepper 2839!

Known in eastern and southern tropical Africa and in **Madagascar**.

5. ***Xyris anceps* Lam.** Tabl. Encycl. 1: 132 (1791); F.T.A. 8: 12; Meikle & Baldwin in Am. J. Bot. 39: 50 (1952); Berhaut, Fl. Sén. 184; Hepper l.c. 419 (1968). *APD acc*

APD: Synonym of Xyris anceps var. minima (Steud.) Lock

***Xyris perroteti* (sic) Steud.** (1855).

***Xyris minima* Steud.** (1855).

Herb with a fan of leaves reddish at the base; inflorescence pale yellowish, 1 ft. or more high; **in wet places, rice fields and mangrove swamps.**

Sen.: Perrottet 809! Kaolak Berhaut 642! 2353. Cayor Leprieur! Casamance Heudelot 562, partly! **Port. G.:** Catió (Dec.) Raimundo & Guerra 716! **Guin.:** Koba (Nov.) Jac.-Jél 7229! **S. RAPATEACEAE

Perennial herbs with a thick rhizome. Leaves radical, narrow, with parallel lateral nerves. Inflorescence scapose, capitate or unilaterally spicate. Flowers hermaphrodite, actinomorphic. Perianth double, the outer hyaline, lobes chaffy, rigid, imbricate, inner tubular, hyaline, lobes ovate, spreading, broadly imbricate. Stamens 6, inserted in the tube; anthers basifixed, 4-locular, loculi confluent at the top and opening by 1 or 2 pores or by a terminal cleft. Ovary superior, perfectly or imperfectly 3-locular; style simple. Ovules few to solitary, basal or axile. Fruit a capsule, opening by 3 valves septate in the middle. Seeds with copious mealy endosperm.

In West Africa (Sierra Leone, Liberia, Iv.Coast), otherwise entirely South American.

MASCHALOCEPHALUS

Gilg & K. Schum. in Engl., Bot. Jahrb. 28: 148 (1900); F.T.A. 8: 89.

- 1** A tufted herb with fibrous roots; leaves in a basal rosette, all in one plane, elongate linear-lanceolate, narrowed to a subobtusate apex, gradually contracted into the sheath at the base, up to 45 cm. long and 3 cm. broad, with a prominent midrib and several less prominent lateral parallel nerves, with distant faint cross-nerves between; sheath folded on each side of the sheath of the next leaf, winged on the back, about 12 cm. long; flower-head sessile in axils of the leaves; bracts 2, almost concealing the flowers; bracteoles several; perianth-tube slender, about 4 cm. long; lobes 6; stamens 6; anthers 5 mm. long, with a produced connective; capsule triangular
.....[dinklagei](#)

Maschalocephalus dinklagei *Gilg & K. Schum.* l.c. (1900); F.T.A. 8: 89; Baldwin in Amer. J. Bot. 37: 402 (1950); Mangelot in Ic. Pl. Afr. I.F.A.N. 7: 61 (1965). *APD acc*

A tufted sedge-like herb with an inflorescence amongst the leaf-bases; flowers yellow; **in wet forested areas in sandy savanna.**

S. L.: Bagroo R. (Apr.) Mann 900! **Lib.:** Grand Bassa (Oct.) Dinklage 2088! E. of Monrovia (Aug.) Baldwin 13054! Kotobanu to Fayapulu, St. Paul R. (Oct.) Bequaert! Gbanga Linder 1002c! Langevina

Jac.-Fél. in Bull. Mus. Hist. Nat. Paris, sér. 2, 19: 88 (1947).

Although this was described as an additional genus in Rapateaceae, its true identity is *Mapania amplivaginata* K. Schum. (*M. oblonga* C.B.Cl.) in Cyperaceae.

Excluded genus

ERIOCAULACEAE

Annuals or perennials; stems often very short, occasionally elongate; leaves narrow, often crowded or rosulate, frequently with large, conspicuous cells. Inflorescence an involucre capitulum comprising numerous small, densely crowded flowers often subtended by floral bracts; peduncle leafless, unbranched, usually arising from a well-developed basal sheath; flowers unisexual, the males and females mixed in the same capitulum, or the males in the middle and the females around, or rarely males and females in separate capitula; perianth membranous or scarious, the segments usually in 2 distinct series, the outer segments ("sepals") generally free in female flowers, often connate in male, the inner ("petals") free or rarely connate in female flowers, connate and often very reduced in male flowers. Stamens equal in number to, or twice as many as the inner perianth segments; anthers 2-thecous, or less often 1-thecous, introrse. Ovary 2-3-locular, ovules solitary, pendulous in each loculus; style usually distinct, divided above into 2-3 elongate, simple (or occasionally bifid) stigmas, sometimes with alternating appendages. Fruit a membranous loculicidal capsule; seeds relatively large, testa generally scabrid or papillose; endosperm copious.

A small homogeneous family of 13 genera, widely distributed in the tropics of the Old and New Worlds, with a few outlying representatives in temperate areas of America, Europe (Skye, Coll and western Ireland) and eastern Asia; many of the species are restricted to wet habitats, a few are strictly aquatic.

The subdivision of the family into genera with stamens equal in number to the inner perianth segments (conveniently named "petals") and those with twice as many stamens as inner perianth segments, is generally valid, but subject to exception in some African Eriocaulon species; it should not be employed as the sole criterion for separating Eriocaulon and Mesanthemum from Paepalanthus and Syngonanthus, though usually a reliable pointer to generic identity.

- 1** Stamens 6 or 4, twice as many as the petals, in 2 series; petals often glandular within near apex:**2**
Stamens 3, as many as the petals; petals rarely glandular within near apex:**3**

- 2 Petals of female flowers free; leaves, peduncles and basal sheaths generally glabrous [1. *Eriocaulon*](#)
 Petals of female flowers connate except at apex and base; leaves, peduncles and basal sheaths generally pubescent [2. *Mesanthemum*](#)
- 3 Petals of female flowers free: [4](#)
 Petals of female flowers connate except at apex and base; leaves, peduncles and basal sheaths usually pubescent and often glandular [4. *Syngonanthus*](#)
- 4 Leaves, peduncles and basal sheaths glabrous; petals glandular near apex; male flowers with much reduced, but distinct, petals (spp. 15 & 25) [1. *Eriocaulon*](#)
 Leaves, peduncles and basal sheaths pubescent; petals eglandular; male flowers without any apparent petals ... [3. *Paepalanthus*](#)

1. ERIOCAULON

Linn., Sp. Pl. 87 (1753); F.T.A. 8: 231; Ruhland in Engl., Pflanzenr. Eriocaulac. 30 (1903).

- 1 Capitula sessile; stamens 3 [25. *sessile*](#)
 Capitula pedunculate; stamens 4 or 6, very rarely 3: [2](#)
- 2 Involucral bracts radiating beyond the head of flowers: [3](#)
 Involucral bracts not radiating beyond the head of flowers: [6](#)
- 3 Sepals of female flowers strongly keeled: [4](#)
 Sepals of female flowers not keeled: [5](#)
- 4 Floral bracts cuspidate-acuminate; sepals of female flowers 2, not overlapping; petals of female flowers 2 or 3; ovary 2-3-locular [21. *irregulare*](#)
 Floral bracts blunt and rounded at apex; sepals of female flowers 2, overlapping; petals of female flowers 2; ovary 2-locular [22. *remotum*](#)
- 5 Capitula 5-9 mm. diam.; leaves 2-6 mm. wide at base; receptacle pilose [20. *togoense*](#)
 Capitula 3-5 mm. diam.; leaves 1-2 mm. wide at base; receptacle glabrous [23. *pulchellum*](#)
- 6 Ovary 2-locular; male flowers with 4 stamens; female flowers with 2 sepals and 2 petals [24. *adamesii*](#)
 Ovary 3-locular; male flowers with 6 (or very rarely 3) stamens: [7](#)
- 7 Female flowers without petals and usually with 2 (rarely without) sepals; receptacle glabrous; anthers pallid [19. *cinereum*](#)
 Female flowers with 3 petals: [8](#)
- 8 Female flowers with 2 sepals; male flowers with 2 free sepals: [9](#)
 Female flowers with 3 sepals and 3 petals; male flowers with 2-3 free or united sepals: [11](#)
- 9 Peduncles 15-35 (-50) cm. long; capitula subglobose, 5-8 mm. diam. [6a. *plumale* subsp. *plumale*](#)
 Peduncles 5-15 (-20) cm. long; capitula 3-5 (-7) mm. diam.: [10](#)
- 10 Involucral bracts dark brown, rather rigid; capitula subglobose [6b. *plumale* subsp. *jaegeri*](#)
 Involucral bracts pallid or fuscous, membranous; capitula hemispherical [6c. *plumale* subsp. *kindiae*](#)
- 11 Leaves and basal sheaths distinctly reddish; peduncles commonly more than 30 cm. long, much longer than the relatively short (1.5-3.5 cm. long) leaves; capitula globose; flowers densely white-papillose [5. *rufum*](#)
 Leaves and basal sheaths not reddish: [12](#)
- 12 Leaves large, either exceeding 15 cm. in length or 1 cm. in width at the base: [13](#)
 Leaves generally less than 10 cm. long or 1 cm. wide at base: [14](#)
- 13 Anthers pallid; leaves rather flaccid, 15-40 (-50) cm. long; sepals of female flowers not distinctly winged-keeled; capitula rarely viviparous [4. *latifolium*](#)
 Anthers fuscous; leaves not flaccid, rather succulent, broad and obtuse at apex; sepals of female flowers strongly winged-keeled; capitula commonly viviparous [1. *zambesiense*](#)
- 14 Male flowers with well-developed plumose, glanduliferous petal-lobes; capitula generally more than 5 mm. diam., flowers conspicuously white-papillose: [15](#)
 Male flowers with minute (generally eglandular) petal-lobes; flowers shortly and sparsely papillose or glabrous: [16](#)
- 15 Leaves flaccid, long-acuminate, usually exceeding basal sheaths; capitula 5-8 mm. diam., peduncles slender, about 5-sulcate [3. *mamfeense*](#)

- Leaves rigid, excavate at apex, much shorter than basal sheaths; capitula about 8 mm. diam., peduncles stout, 7-8-sulcate [2. intrusum](#)
- 16** Floral bracts acuminate-cuspidate, exceeding the flowers and giving the capitula an echinate appearance: **17**
- Floral bracts not acuminate-cuspidate; capitula not echinate in appearance: **18**
- 17** Stamens 3, anthers pallid; petals linear; capitula subglobose, pale, stramineous [15. jordanii](#)
- Stamens 6, anthers fuscous; petals oblanceolate; capitula hemispherical, pallid or fuscous towards centre. [14. meikleii](#)
- 18** Stem elongate; leaves filiform, scattered, not in a rosette; capitula blackish; aquatic plant [7. setaceum](#)
- Stem very short or almost wanting; leaves in a dense tuft or rosette; plants generally terrestrial: **19**
- 19** Involucral bracts minute or apparently wanting; capitula small, globose, black or more or less densely white-papillose [12. elegantulum](#)
- Involucral bracts well developed and easily visible, especially in the young capitula: **20**
- 20** All the sepals of the female flowers concave, but without a spongy or winged keel, not markedly unequal: **21**
- Two of the larger sepals (or all the sepals) of the female flowers with a distinct spongy or winged keel, the third sepal usually much smaller than the others: **24**
- 21** Sepals of male flowers 3, free to base; sepals and petals of female flowers linear or filiform [16. bongense](#)
- Sepals of male flowers connate into a spathe: **22**
- 22** Receptacle glabrous or very thinly pilose; leaves subulate with a long slender acumen; petals of female flowers narrowly linear [17. abyssinicum](#)
- Receptacle pilose; leaves linear or strap-shaped, acute or shortly acuminate; petals of female flowers narrowly oblanceolate: **23**
- 23** Involucral bracts erect, appressed to capitulum, rather rigid; capitula greyish, shortly papillose; floral bracts rather regularly imbricated [8. afzelianum](#)

- Involucral bracts not conspicuous, concolorous with floral bracts; capitula globose; petals of female flowers glanduliferous [11. inundatum](#)

1. *Eriocaulon zambesiense* Ruhland in Engl., Bot. Jahrb. 27: 75 (1899); F.T.A. 8: 252. *APD acc*

Peduncles up to 2 ft. 8 in. high; capitula 5-8 mm. diam. covered with whitish papillae, generally viviparous.

W. Cam.: Pinyin, 5,500 ft. (Apr.) Brunt 1092! Kumbo to Oku, Bamenda, 6,000 ft. (Feb.) Hepper 2021! Lakom, Bamenda, 6,000 ft. (June) Maitland 1400! **F. Po:** (Dec.) Monod 10358!

[The specimen from F.Po closely resembles typical *E. zambesiense*, but those from W.Cam. are altogether more robust, with very broad and blunt leaves, up to 1.5 cm. wide at the base.]

2. *Eriocaulon intrusum* Meikle in Kew Bull. 22: 141 (1968).

APD: Synonym of Eriocaulon teusczii Engl. & Ruhland

Eriocaulon lacteum of F.W.T.A., ed. 1, 2: 327, not of Rendle.

Each plant generally with only one scape; peduncle up to 16 in. long; capitulum white-papillose with conspicuous pale brown, blunt involucral bracts.

N. Nig.: Naraguta, Plateau Prov. (June) Lely 283!

3. *Eriocaulon mamfeëense* Meikle l.c. 141 (1968). *APD acc*

Each plant with several scapes; peduncle to 1 ft. long, shining; capitula subglobose, densely white-papillose.

W. Cam.: Mamfe (Nov., Mar.) Morton K676! Migeod 276! Tamajong FHI 22107! Richards 5246!

4. *Eriocaulon latifolium* Sm. in Rees, Cyclop. 13 (1819); F.T.A. 8: 243; Ruhland in Engl., Pflanzenr. 4, 30: 78 (1903). *APD acc*

Eriocaulon rivulare G. Don in Hook., Fl. Nigrit. 547 (1849).

Eriocaulon thunbergii Wickstr. ex Koern. in Linnaea 27: 677 (1856).

Eriocaulon banani Lecomte in Bull. Soc. Bot. Fr. 55: 645 (1909).

Eriocaulon latifolium forma *proliferum* Moldenke in Phytologia 8: 387 (1962).

Mesanthemum radicans Stapf in Johnston, Liberia 2: 662 (1906), not of (Benth.) Koern.

Robust aquatic perennial; capitula densely white-papillose, to 14 mm. diam.

Mali: Banankoro (Mar.) Chev. 524! Sikasso (May) Chev. 803! **Port. G.:** Boé, Madina (Feb.) Pereira 2999! **Guin.:** Conakry (Jan.) Dalz. 8247! Dalaba (Oct., Nov., Mar.) des Abbayes 699! Adames 416! Langdale-Brown 2638! **S. L.:** Afzelius! York (Apr.) Adames 206! Tawia Deighton 1031! Gbangabatok (Jan.) Capstick in Hb. Deighton 5301! Magbema (Mar.) Jordan 427! Farangbaya Crisp Al! Bandakafaia (Oct.) Jaeger 8096! **Lib.:** Mouth of Loffa R., Grand Cape Mount (Dec.) Baldwin 10946! Genne Tanyehun, Grand Cape Mount (Dec.) Baldwin 10091! Kakatown Whyte! Nimba (Dec.) Adames 808!

Also in **Congo** and **Angola**.

5. *Eriocaulon rufum* Lecomte in Bull. Soc. Bot. Fr. 55: 644 (1909).

APD: *Synonym of Eriocaulon plumale* N.E. Br. subsp. *plumale*

Eriocaulon plumale of F.W.T.A., ed. 1, 2: 327 partly, not of N.E. Br.

Strictly erect; scapes usually numerous; capitula globose to 10 mm. diam., florets generally concealing involucre bracts in fully developed capitula.

Guin.: Conakry Maclaud! Ouassou (Nov.) Jac.-Fél. 7256! Kindia (Oct.) Pobéguin 1312! Bena, Fouta Djallon (Feb.) Arrieu 230 in Hb. Chillou 3139! **S. L.:** Kasawe F.R., Yoni Mamila Chiefdom (Dec.) King 55b!

6. *Eriocaulon plumale* N.E. Br. in F.T.A. 8: 251 (1901); Ruhland in Engl., Pflanzenr. 4, 30: 106 (1903); F.W.T.A., ed. 1, 2: 327 partly. *APD acc*

Eriocaulon senegalense N.E. Br. in F.T.A. 8: 251(1901).

6a. *Eriocaulon plumale* subsp. *plumale* *APD acc*

Each plant with numerous leaves and scapes; leaves narrow, linear-subulate; capitula subglobose, white, plumose; involucre bracts pale shining brown.

Sen.: Badi (Dec.) Berhaut 1121! Bala (Nov.) Berhaut 1258! **Guin.:** Rio Nunez Heudelot 680! **S. L.:** Wellington (Nov.) Deighton 1867! Port Loko (Oct.) Jordan 632! Kambia (Oct.) Jordan 658! 944! **Iv. C.:** Cissé Dougou, Boundiali to Mankono (Nov.) Aké Assi 8294!

6b. *Eriocaulon plumale* subsp. *jaegeri* (Moldenke) Meikle in Kew Bull. 22: 142 (1968). *APD acc*

Eriocaulon jaegeri Moldenke in Phytologia 5: 338 (1956).

Mesanthemum necopinatum Moldenke l.c. 8: 389 (1962).

Scapes and leaves numerous; leaves subulate-filiform; capitula white, plumose, 5-7 mm. diam., subglobose; involucre bracts rather rigid, dark brown.

Guin.: Friguiagbé Chillou 906! Fouta Djallon (Sept., Oct.) Adames 342! Schnell 7393! Loursa Mt., Dabola (Sept.) Jaeger 4917!

6c. *Eriocaulon plumale* subsp. *kindiae* (Lecomte) Meikle l.c. 142 (1968). *APD acc*

Eriocaulon kindiae Lecomte in Bull. Soc. Bot. Fr. 55: 646 (1909).

Eriocaulon pumilum of F.W.T.A., ed. 1, 2: 326 partly, not of Afzel. ex Koern.

Mesanthemum chilloui Moldenke in Phytologia 8: 389 (1962).

Scapes and leaves numerous; leaves subulate-filiform; capitula hemispherical, 3-5 mm. diam., white, plumose, said to be fragrant; involucre bracts pale brown or greenish, not rigid.

Guin.: Friguiagbé (Sept.) Chillou 716! 717! Boismaré 386 in Hb. Chillou 3903! Kindia Pobéguin 1359 bis! **S. L.:** Waterloo (Aug.) Melville & Hooker 276! Kambia (Aug., Sept.) Jordan 303! Adames in Hb. Jordan 664! Harvey 33!

Also in **Chad**.

7. *Eriocaulon setaceum* Linn. Sp. Pl. 87 (1753). *APD acc*

Eriocaulon melanocephalum Kunth, Enum. Pl. 3: 649 (1841).

Eriocaulon bifistulosum van Heurck & Muell. Arg. in van Heurck, Obs. Bot. 105 (1870); F.T.A. 8: 239 (1901); Ruhland in Engl., Pflanzenr. 4, 30: 90 (1903); F.W.T.A., ed. 1, 2: 326.

Eriocaulon limosum Engl. & Kuhl. in Engl., Bot. Jahrb., 27: 74 (1899).

Floating aquatic; stems elongate, clothed with numerous filiform leaves; scapes generally numerous; capitula blackish, small, seldom exceeding 4 mm. diam.

Sen.: Oussouye (Nov.) Berhaut 6502! **Mali:** Macina (Nov.) Monod! Sarekoye (Feb.) Davey 22! **Port. G.:** Saucunda to Buba (Oct.) Esp. Santo 2195! **Guin.:** Boffa (Dec.) Jac.-Fél. 7361! Plants forming dense cushions; leaves greyish, strongly recurved; capitula greyish, pilose, hemispherical, about 5 mm. diam.; sepals of female flowers not recurving at maturity.

S. L.: Kissy Bockstatt!

[A very rare plant, only once collected, and unsatisfactorily localized; its rediscovery would be very welcome.]

4. SYNGONANTHUS

Ruhland in Urban, Symb. Antill. 1: 487 (1900). and in Engl., Pflanzenr. 4, 30: 242-282 (1903). *APD acc*

1.1. Leaves thinly pubescent or nearly glabrous above, lanuginose at base, densely tufted, up to 3 cm. long; scapes often numerous, arising from the centre of the leaf-tuft, up to 25 cm. long, sheaths and peduncles subglabrous or more often with patent glandular hairs; capitula hemispherical, about 5-7 mm. diam., involucre bracts brownish; sepals thinly pilose towards apex [*wahlbergii*](#)

***Syngonanthus wahlbergii* (Koern.) Ruhland** in Engl., Pflanzenr. 4, 30: 247 (1903). *APD acc*

Paepalanthus wahlbergii Koern. in Mart., Fl. Brasil. 3, 1: 459 (1863); F.T.A. 8: 283.

Syngonanthus chevalieri Lecomte in Bull. Soc. Bot. Fr. 55: 597 (1909); F.W.T.A., ed. 1, 2: 328.

Plants usually forming crowded tufts; leaves narrowly linear-subulate, often distinctly recurved, and white-lanuginose at base; peduncles slender, wiry, minutely glandular (especially just below capitulum); flowers brownish, sometimes dark brown.

N. Nig.: Nupe Barter 1539!

Widespread in tropical Africa and south to the Transvaal.

BROMELIACEAE

Mostly short-stemmed epiphytes or growing on rocks. Leaves usually in a dense cluster, long and strap-shaped, rigid and spinulose-toothed or rarely flaccid, often coloured towards the base. Flowers in a terminal head, spike, or panicle often with highly coloured bracts, actinomorphic, bisexual or rarely unisexual. Perianth hypogynous to epigynous, segments in two series, the outer calyx-like, imbricate, the inner corolla-like and free or variously connate, imbricate. Stamens 6, mostly inserted at the base of the segments, free or partially adnate to them; anthers free or rarely connate in a ring, linear, usually versatile, 2-locular, opening by longitudinal slits. Ovary superior to inferior, 3-locular; style slender, elongated, stigmas 3. Ovules numerous in each loculus, the axile placentas sometimes divided. Fruit fleshy and indehiscent or rarely opening unevenly, or rarely a septicidal or loculicidal capsule. Seeds with abundant mealy endosperm and a small embryo, sometimes winged.

A tropical American family with only the following species represented in Africa.

Ananas comosus (Linn.) Merrill

A. sativus Schult. f.

The pineapple is widely cultivated and often naturalized.

PITCAIRNIA

L'Hérit., Sert. Angl. 7, t. 11 (1789), nom. cons.

- 1** Rhizomatous, glabrous herb; leaves linear, 30-50 cm. long, 5-9 mm. broad, distantly serrate with spiny curved teeth; inflorescence racemose, 8-15 cm. long, borne on an erect leafy scape about 30 cm. long; flowers 5 cm. long; sepals coriaceous, lanceolate, acute 15-22 cm. long, petals 5 cm. long; stamens 3/4-length of petals; ovary 3-lobed, style longer than the stamens; style capitate and contorted; seeds numerous, linear[feliciana](#)

Pitcairnia feliciana (A. Chev.) Harms & Mildbr. in Notizbl. Bot. Gart. Beri. 14: 118 (1938); Hepper in Webbia 19: 601 (1965). *APD acc*

Willrussellia feliciana A. Chev. in Bull. Soc. Bot. Fr. 84: 502, fig. 1 (1937).

A tufted herb with stout rhizomes and narrow spiny leaves; flowers orange-yellow; [in crevices on rock out-crops](#).

Guin.: Kindia (fl. July, fr. Sept.) Jac.-Fél. 1856! Schnell 2201! 3126! Télimélé (fr. Jan.) Roberty 16453!

MUSACEAE

Stems formed by the imbricate bases of the petioles, erect. Leaves spirally arranged, very large, with a thick midrib and numerous pinnately parallel nerves. Flowers mostly unisexual, clustered and subtended by large green spathaceous bracts, the male flowers within the upper bracts, the female within the lower. Calyx elongated, at first narrowly tubular, soon splitting on one side, variously toothed at apex. Corolla more or less 2-lipped. Stamens 5 perfect, with a rudimentary sixth, or 6 perfect; filaments filiform; anthers 2-locular, the loculi parallel and contiguous. Ovary inferior, 3-locular; ovules numerous, axile; style filiform, with a lobulate stigma. Fruit fleshy, indehiscent, 3-locular. Seeds with a thick hard testa and straight embryo in copious endosperm.

Many varieties of bananas and plantains (*Musa* spp.) are cultivated in our area. The wild African bananas are now distinguished as a separate genus *Ensete*, which is monocarpic. *Musa* differs from *Ensete* in being perennial and producing

suckers; bracts and flowers are inserted independently on the axis; seeds are small and rarely produced. See Simmonds, Bananas (1959).

Ravenala madagascariensis *Sonn.*

The fan-like Travellers Tree from Madagascar, is occasionally cultivated.

This genus is now usually placed in the family Strelitziaceae.

Strelitzia spp.

From S. Africa may be cultivated as ornamentals.

This genus is now usually placed in the family Strelitziaceae.

ENSETE

Horan., Prod. Monogr. Scit. 40, t. 4 (1862); Cheesman in Kew Bull. 2: 97 (1947); Baker & Simmonds in Kew Bull. 8: 405 (1953).

- 1 Plant 1.5-3 m. high; leaves spread along the stem and not aggregated towards apex, lower leaves up to 1.5 m. long reducing in size upwards so that the upper leaves become bracts; male bracts 4.5-9 cm. long, 17-25 cm. broad; stamens 6, 12 mm. long; female flower with rudimentary stamens; fruit squat angular, rather obconic, about 5 cm. long; seeds 7-9 mm. diam., hard [gillettii](#)

Ensete gillettii (*De Wild.*) *E. E. Cheesman* l.c. 103 (1947); Baker & Simmonds l.c. 407 (1953); Koechlin in Fl. Cam. 4: 11, t. 3.

APD: Synonym of Ensete livingstonianum (Kirk) Cheesman

Musa gillettii *De Wild.* in Rev. Cult. Colon. 8: 102 (1901); Not. Pl. Ut. Intér. Fl. Congo 1: 73, t. 5, 6, 7(1-2) (1903).

M. chevalieri *Gagnepain* (1908).

M. schweinfurthii of F.W.T.A., ed. 1, 2: 328 not of K. Schum. & Warb. ex K. Schum.

A wild banana of hilly grassland savanna. The leafy young stem dies back to a hard round corm about 1 ft. across remaining on the soil surface; fertile stem nodding, bearing a mass of small fruits about 2 in. long with yellow or orange pulp and large dark brown seeds which are later exposed by longitudinal splitting of the fruit; male bracts mauve.

Musa martreliana A. Chev. and *M. riperti* A. Chev., Bot. 632, names only, cited in Ed. 1 as synonyms of *M. schweinfurthii*, are rejected by Simmonds (l.c. 409) as being nomina nuda and having no standing.

ZINGIBERACEAE

Perennial herbs, usually aromatic, with horizontal tuberous rhizomes; stems sometimes very short, leafy or bearing only flowers. Leaves in two rows or spirally arranged, with an open or closed sheath, sessile or stalked on the sheath, the blade usually large with numerous closely parallel pinnate nerves diverging obliquely from the midrib. Flowers solitary or in a distinct inflorescence accompanying or separate from the leaves, mostly bisexual, symmetric or asymmetric. Perianth 6-merous, 2-seriate, the outer calyx-like, the inner corolla-like and often very showy and delicate; outer segments united into a tube, inner more or less united, the posterior segment usually the largest. Stamen 1, with a 2-locular anther, sometimes accompanied by petaloid staminodes which may form the conspicuous part of the flower (see Fig. 341). Ovary inferior, (2-)3-celled with axile placentas, or 1-locular with parietal or rarely basal placentas; style sometimes enveloped in a groove of the fertile stamen. Ovules mostly numerous. Fruit fleshy and indehiscent or a capsule. Seeds mostly arillate; endosperm abundant, white.

Tropics and subtropics.

- 1 Flowers paniculate, inflorescences terminating leafy stems or arising separately; lateral staminodes rudimentary or suppressed; filament and connective of stamen not petaloid [1. *Renealmia*](#)
- Flowers spicate often in a strobiliform inflorescence, or solitary: **2**
- 2 Flowers at ground level appearing before the leaves (or when the leafy shoot is beginning to grow); lateral staminodes large and petaloid, forming the conspicuous part of the flower; stamen connective not petaloid .. [2. *Kaempferia*](#)
- Flowers appearing with the mature leaves either on leafy shoots (sometimes at ground-level) or on separate basal inflorescences; lateral staminodes rudimentary or suppressed; conspicuous part of the flower usually a large labellum (= petaloid staminode): **3**
- 3 Leaves distichously arranged on tall steins; inflorescences always separate with 1-several flowers; filament and connective not petaloid, but surmounted by 2 lateral horns and usually an apical process between them [3. *Aframomum*](#)
- Leaves spirally arranged on tall or short stems or only 1 or 4 leaves present; inflorescences terminal or separate; filament and connective petaloid bearing the anther in the middle [4. *Costus*](#)

[Both destroyed at Berlin]. Although the type of this species was seen for F.W.T.A., ed. 1, and the species was maintained it seems to be doubtfully distinct from *R. africana*. Imperfectly known species

2. KAEMPFERIA

Linn., Sp. Pl. 2 (1753); F.T.A. 7: 294 (1898); K. Schum. in Engl., Pflanzenr. 4, 46, Zingib.: 64 (1904); F.W.T.A., ed. 1, 2: 334.

- 1 Calyx 3-4 cm. long, shortly 3-lobed, lobes rounded; petals lanceolate, 4 cm. long, united into a slender tube; petaloid staminodes about 10 cm. long, limb nearly as wide, the tip broad and emarginate; flowers arising in a separate cluster from the rhizome; leafy stems arising separately from the rhizomes; pseudostems of petioles well developed, about 50 cm. long; basal leaves reduced to sheaths, mature upper leaves oblong-lanceolate to oblanceolate, up to 38 cm. long and 4.5(-9) cm. broad, very acute at apex; ligule conspicuous, 1-1.5(-3) cm. long; tubers oblong-fusiform, about 5 cm. long [1. *aethiopica*](#)

Calyx about 1-5 cm. long; ligule inconspicuous, 2-5 mm. long; mature upper leaves almost elliptic about 40 cm. long and 15 cm. broad; pseudostem of petioles not well developed, about 20 cm. long when fully grown [2. *nigerica*](#)

Kaempferia galanga Linn.

This Asiatic species is cultivated in southern Sierra Leone.

1. *Kaempferia aethiopica* (Schweinf.) Solms-Laub. in Schweinf. l.c. 198 (1867); F.T.A. 7: 294; K. Schum. l.c. 66, fig. 10 A-C; F.W.T.A., ed. 1, 2: 334; Troupin in Expl. Parc Nat. 3. AFRAMOMUM

K. Schum. in Engl., Pflanzenr. 4. 46, Zingib.: 201 (1904). *APD acc*

Amomum Linn., partly—F.T.A. 7: 302.

- 1 Leaves hairy on both surfaces or only beneath:2
 Leaves glabrous beneath except sometimes on the midrib and along the margins:5
- 2 Leaves loosely pilose with rather long hairs; lateral parallel nerves very numerous:3
 Leaves shortly felted-tomentose beneath, glabrous above, elongate-oblong, subobtusate at base, about 35 cm. long and 6 cm. broad, with very numerous crowded ascending parallel lateral nerves; ligule 6 mm. long, ribbed; leaf-sheath with conspicuous transverse veinlets; inflorescences short (but see note after sp.), about 10 cm. long, 1-2-flowered, with closely imbricated bracts; fruits narrowly obovoid, about 7 cm. long (Fig. 344G) ...[3. subsericeum](#)
- 3 Inflorescences very short (about 4 cm.) and clustered, 1-flowered; labellum and hood very narrow; fruit oblong, 2.5 cm. long; lamina subsessile on the pilose sheath, unequal-sided at base, long-acuminate, nearly 30 cm. long and 5-6 cm. broad, laxly pilose on both surfaces, with a conspicuous striated midrib, densely ciliate (Fig. 344D) [1. pilosum](#)
 Inflorescences nearly as long as or longer than the lamina, several-flowered; lamina unequal-sided at the base, rounded into a distinct short stalk on the sheaths, long-acuminate, 20-35 cm. long, 5-10 cm. broad, glabrous above, sheath pilose or more or less glabrous:4
- 4 Labellum about 4 cm. long; peduncle covered with stiff imbricated bracts about 4 cm. long; flowers rather few; fruits ovoid, 2-4 enveloped in upper bracts [2. elliotii](#)
 Labellum about 2 cm. long; peduncle with few papery bracts hardly imbricated, about 3 cm. long; flowers up to 20; fruits longitudinally ribbed [4. polyanthum](#)
- 5 Leaves auriculate-cordate and sessile at the base at the junction with the sheath, elongate-oblong, acuminate, about 30 cm. long and 5 cm. broad, with numerous spaced ascending parallel nerves; sheath ribbed but without transverse veinlets; inflorescences much elongated, simple or branched at the top; bracts shortly overlapping; fruits with a long, persistent, tubular beak (Figs. 343D, 344E) [6. longiscapum](#)
 Leaves not auricled, at most rounded-subcordate at the junction with the sheath and false petiole:6
- 6 Fruit grooved or corrugated (usually 9 regular longitudinal lines), pubescent or glabrous; labellum broad:7
 Fruit smooth, not grooved or corrugated (apart from perhaps a few folds towards the apex and shrinkage wrinkles in dried specimens); ovary glabrous: 10
- 7 Fruit (and ovary) pubescent, corrugated when fresh, about 6 cm. long, several clustered at apex of 8-18 cm.-long inflorescence; bracts becoming narrower and thinner towards apex; leaves oblong-lanceolate, almost 20 cm. long and 6 cm. broad, rounded at each end and tailed at apex, lateral veins more than twice their own thickness apart3 (Fig. 343B) [7. exscapum](#)
 Fruit glabrous, deeply grooved or ribbed:8
- 8 Lateral veins of leaves very close and less than twice their thickness apart3; fruits ovoid, deeply grooved, about 5 cm. long, crowned by long persistent calyx:9
 Lateral veins of leaves more than twice their own thickness apart3, lamina oblong-elliptic, 18-28 cm. long, 5-10 cm. broad, midrib pubescent, false petiole 1 cm. long; ligules short and rounded; inflorescence simple, with numerous flowers, labellum 2 cm. long, less than 1 cm. broad; fruits strongly ribbed, ovoid, about 4 cm. long, with short calyx [5. chlamydanthum](#)
- 9 Flowers mauve, well exerted from bracts, labellum obovate 3.5 cm. broad; anther connective with an oblong-deltoid appendage at the apex; inflorescences simple or sometimes branched; leaves oblong-lanceolate, acuminate, 10-30 cm. long, 3-7 cm. broad, hardly petiolate [8. sulcatum](#)
 Flowers orange-red, crowded by bracts, labellum oblong, 2 cm. broad; anther connective with a rounded appendage at apex; inflorescences branched; leaves 30-50 cm. long, 7-10 cm. broad [9. daniellii](#)
- 10 Lateral nerves of the leaves more than twice their own thickness apart3: 11
 Lateral veins of leaves very close, twice their own thickness apart or less; margins glabrous; ligulos short: 18
- 11 Leaf-margins the whole length pubescent with short brown hairs; lamina linear-oblong, 20-31 cm. long, 3-6 cm. broad midrib tomentose or glabrous; ligule rounded, up to 3 mm. long; inflorescences very short; labellum broad (Fig. 344F) [10. limbatum](#)
 Leaf-margins glabrous or only upper part pubescent; labellum very broad and conspicuous: 12
- 12 Ligules up to 4 mm. long; inflorescences at base of stem; ligule rigid, not divided: 13
 Ligules 1-3 cm. long or if less then papery and paired on each sheath: 15

- 13** Flowers white: **14**
 Flowers mauve, inflorescences several-flowered, short up to 10 cm. long, with broad imbricated bracts; leaves oblong, 20-30 cm. long, rounded to a short petiole at the base, abruptly acuminate at apex, 4-5 cm. broad .. [13. sp. A](#)
- 14** Tufted herb lacking slender rhizomes; leaves oblong to oblong-elliptic, 13-38 cm. long, 2-8 cm. broad, cuspidate at apex, rounded at base, shortly petiolate; fruits long beaked; seeds angular, grey; bracts closely imbricated, stiff, striate [11. strobilaceum](#)
 Rhizomatous herb; leaves elliptic, 10-27 cm. long, 4-7.5 cm. broad, long-tailed at apex, cuneate to rounded at base, distinctly petiolate; fruits ovoid, not beaked; seeds rounded, glossy brown; bracts papery .. [12. stanfieldii](#)
- 15** Inflorescences arising at base of the stem; plant tufted or rhizomatous: **16**
 Inflorescences arising from slender rhizomes some distance from the stem, very short with pale papery bracts 1 cm. broad, flowers usually paired [17. leptolepis](#)
- 16** Inflorescence slender, 10-30 cm. long, distinctly pedunculate and covered with rather stiff bracts, few-flowered: **17**
 Inflorescences short and massive with numerous broad imbricated bracts 6 cm. broad; flowers numerous; ligules obtuse or acute, 1-3 cm. long; fruits ovoid, about 4.5 cm. long with persistent calyx at least the same length (Figs. 343C, 344A) [16. citratum](#)
- 17** Rhizomatous herb; inflorescences at ground level, 10-30 cm. long, covered with papery bracts; labellum very broad, mauve; fruits narrowly ovoid; leaves oblong, 12-20 (-28) cm. long, acuminate, cuneate to rounded at base, with more or less distinct false petiole; ligule very variable, more or less triangular apex, easily breaking off (Figs. 343A, 344C) [14. sceptrum](#)
 Tufted herb; inflorescences about 12 cm. long, closely imbricated by stiff bracts; labellum broadly elliptic, 5.5 cm. long, 4.5 cm. broad [15. erythrostachyum](#)
- 18** Midrib beneath pubescent or pilose its whole length at least along the side of the midrib; lamina oblong-ob lanceolate, cuneate at base, gradually but acutely acuminate, 20-33 cm. long, 4-7 cm. broad; inflorescences short at ground level, labellum oblong and similar in size to the hood; fruits broadly ovoid (see also No. 2.) [18. baumannii](#)
 Midrib glabrous; labellum about 4 cm. long, rather or very broad and much larger than the hood: **19**
- 19** Leaves narrow (broadly-linear), about 3 cm. broad, 20 cm. long; numerous lateral nerves very prominent and all similar on both sides of the lamina, tailed-acuminate, ligule short and rounded; inflorescences very short and narrow, 1-flowered; bracts rounded and mucronate; fruits ovoid, 4 cm. long, beaked by the persistent calyx; tufted plant (Fig. 344H) [19. melegueta](#)
 Leaves lanceolate to oblong-lanceolate, the veins often rather indistinct, about 20 cm. long, 3-10 cm. broad, acute to shortly tailed at apex, rounded at base, false petiole wanting; ligules short; inflorescences several flowered, about 10 cm. long; fruits broadly ovoid, 7 cm. long, shortly beaked; creeping rhizomatous plant [20. latifolium](#)

1. Aframomum pilosum (Oliv. & Hanb.) K. Schum. in Engl., Pflanzenr. 4, 46, Zingib.: 206 (1904); Koechlin in Fl. Cum. 4: 45, t. 9 (1965). *APD acc*

Amomum pilosum Oliv. & Hanb. in J. Linn. Soc. 7: 110 (1863); Baker in Hook., Ic. Pl. t. 2483 (1892); F.T.A. 7: 307.

A herb 6-8 ft. high, with very short bracteate 1-flowered inflorescences at the base of the stem; labellum yellow.

S. Nig.: near Umudike (fl. Aft. June) Ariwaodo ARS 1227! Oban Talbot 94! **F. Po.:** Mann 1415!

Also in **E. Cameroun**.

2. Aframomum elliotii (Bak.) K. Schum. l.c. 209 (1904); Chev. Bot. 625; Aké Assi, Contrib. 2: 16 [225]. *APD acc*

Amomum elliotii Bak. in F.T.A. 7: 309 (1898).

A herb in shady woods; inflorescences from the base of the stem, stout, about 1 ft. long, with a cluster of vanilla-scented flowers at the top; bracts on the peduncle about 2 in. long; petaloid staminode white, yellowish in the throat, fruits red and shining; **in swamp forest, brackish lagoon bank, or wet grassland.**

Sen.: Perrottet! Yambalba, Cape Verde (May) Leprieur! **Guin.:** Erimakuna (= Hérémakuna) (fr. Mar. Sc. Elliot 5249! source of the Sassandra R., near Sahadougou (Mar.) Chev. 20872! **S. Also in **E. Cameroun.**

[The type of *A. kayseranum* was collected at Buea in forest: it may not, therefore, be conspecific with *A. latifolium* a savanna species-F.N.H.]

4. COSTUS

Linn., *Sp. Pl.* 2 (1753); *F.T.A.* 7: 297.

Cadalvena Fenzl (1865)-*F.T.A.* 7: 296.

- 1 Leaves in a basal rosette or solitary; inflorescence amongst leaves:2
 Leaves numerous borne on tall stems; inflorescences may be separate, terminating leafy stems or lateral:3
- 2 Leaves several in a basal rosette flat on the ground, obovate-orbicular, rounded to a mucronate apex, broadly cuneate at the base, up to 12 cm. long and 10 cm. broad, with fairly numerous ascending nerves and fine parallel transverse veins, pubescent beneath; flowers arising from the centre of the rosette; calyx spathaceous, tube 4 cm. long; savanna herb [1. spectabilis](#)
 Leaves solitary, broadly obovate-elliptic, not acuminate, shortly narrowed at the base, 8-12 cm. long, 6-8 cm. broad, with numerous ascending nerves, glabrous; flower-spike small, sessile at the apex of the stem within the leaf-sheath, 2-3-flowered [2. engleranus](#)
- 3 Inflorescences lateral with few flowers on leafy stems; leaves glabrous; ligules tubular and very long, reaching nearly to the next leaf:4
 Inflorescences terminal or on separate shoots, with numerous flowers; leaves obovate-elliptic, cuneate at the base, long-acuminate, 10-31 cm. long, 3-7 cm. broad, glabrous to pubescent, shortly petiolate:5
- 4 Inflorescences surrounded by a few imbricated ovate bracts up to 2 cm. long forming a small compact subsessile head about 2 cm. across; floral bracts lanceolate, pubescent; calyx 1.5 cm. long, 3-toothed, glabrous; leaves oblong, long-acuminate, narrowed and shortly petiolate, 12-20 cm. long, 4.5-5 cm. broad [3. talbotii](#)
 Inflorescences with small bracts at the base about 5 mm. long, head shortly stalked; floral bracts oblong, truncate, pubescent; calyx 1-1.5 cm. long, 3-toothed, shortly pubescent; leaves ovate, acuminate, cuneate at the base, shortly petiolate (8-)10-18 cm. long, (3-)4-8 cm. broad [4. lateriflorus](#)
- 5 Each bract covering one flower:6
 Each bract covering two flowers (at different stages of development); flowers pink, yellow or white; large cone-like inflorescences usually terminating leafy shoots and sometimes short leafless stems:9
- 6 Bracts all leafy at apex with broadly ovate appendage up to 3 cm. long, and 2 cm. broad; inflorescences apparently always terminal; plant densely pilose [5. fissiligulatus](#)
 Bracts (except sometimes outer ones) not leafy at apex; leaf-sheaths without a rim below the apex; plant glabrous or pubescent:7
- 7 Leaves and stems densely setose and with fine short pubescence beneath i.e. two kinds of hairs; edge of leaf-sheath lanate with long matted hairs; inflorescences always basal; flowers uniform pale pink [6. schlechteri](#)
 Leaves pubescent (at the most sparsely setose on the stem), or glabrous:8
- 8 Flowers white with yellow throat; inflorescences basal and terminal; ochrea as long as broad; leaves shortly appressed-pubescent [7. dubius](#)
 Flowers white with rich pink tip; inflorescences always terminal; ochrea very short; leaves pilose beneath [8. sp. A](#)
- 9 Leaf-sheaths usually without a rim below the apex or if present then lacking long bristles: 10
 Leaf-sheaths with a long bristly rim below the apex; calyx-tube usually much longer than the bract, puberulous; inflorescence globose [11. lucanusianus](#)
- 10 Calyx-tube included behind the bract, more or less glabrous: 11
 Calyx-tube longer than the bract, usually densely puberulous [11. lucanusianus](#)
- 11 Leaf-sheaths expanded 2-5 mm. beyond insertion of petiole; leaves glabrous or slightly pubescent; stems usually stout [9. afer](#)
 Leaf-sheaths prolonged into a cylindrical ochrea 1 cm. or more long; leaves glabrous; stems slender; inflorescence cylindrical [10. deistelii](#)

Guinea 2293!

Also in **E. Cameroun**.

3. *Costus talbotii* Ridl. in Cat. Talb. 111 (1913). *APD acc*

Herb with wiry stem covered with long cylindrical ligules; flowers in apparently lateral heads.

S. Nig.: Oban Talbot 1521!

[Talbot 839 included as *C. dinklagei* K. Schum. in Ed. 1 appears to be a mixture. A leafy shoot with densely hairy sheaths may be *C. dinklagei* but it is sterile and the type from E. Cameroun is not available for comparison. The remainder of Talbot 839 included glabrous detached leaves, a leafless stem with long sheaths and a few flowers resembling those of *C. talbotii* or *C. lateriflorus*-F.N.H.]

4. *Costus lateriflorus* Bak. in F.T.A. 7: 301 (1898); Koechlin in Fl. Gabon 9: 76, t. 16. *APD acc*

An epiphyte in forest; flowers pale yellow with a red patch inside.

S. Nig.: Orukim to Unyene, near Stubbs Creek, Eket Dist. (May) Onochie FHI 33177! Ikette, Obudu Savory & Keay FHI 25202!

Extending to Gabon.

5. *Costus fissiligulatus* Gagnep. in Bull. Soc. Bot. Fr., sér. 4, 2: 93 (1902); Koechlin in Fl. Gabon 9: 78, t. 17, and in Fl. Cam. 4: 86, t. 18. *APD acc*

A hairy herb with foliaceous bracts in a cone-like inflorescence.

S. Nig.: Calabar to Mamfe (Feb.) Onyeachusim & Latilo FHI 54099! Ubiaja to Ihishi, Benin (Dec.) Lowe FHI 47973!

Extending to Gabon.

[Several similar species have been described and the specimens cited are tentatively referred to *C. fissiligulatus* Gagnep. They are possibly the robust var. major Gagnep l.c. 94 (1902), which approaches *C. dewevrei* De Wild. & Th. Dur.-F.N.H.]

6. *Costus schlechteri* Winkler in Engl., Bot. Jahrb. 41: 275 (1908). *APD acc*

A herb with hairy leaves and stem, up to 6 ft. high, with terminal inflorescence.

Lib.: Sarbo, Webo Dist. (July) Baldwin 6410! **Iv. C.:** Dyolas country, Upper Sassandra (Aug.) Chev. 21517! **S. Nig.:** Afi River F.R. (May) Jones & Onochie FHI 18913! Calabar to Mamfe, Ikpai Dist. (Feb.) Onyeachusim & Latilo FHI 54099! **W. Cam.:** Victoria Winkler 25a.

7. *Costus dubius* (Afzel.) K. Schum. in Engl., Pflanzenr. 4, 46: 395 (1904); Hepper in Kew Bull. 22: 464 (1968). *APD acc*

Zingiber dubium Afzel., Remed. Guin. 3: 9 (1810).

Costus zechii K. Schum. l.c. (1904).

Costus albus A. Chev. ex J. Koechl., Fl. Gabon 9: 68, t. 14 (1964), and in Fl. Cam. 4: 78, t. 16; Chev. Bot. 607 (1920), name only; F.W.T.A., ed. 1, 2: 334.

Tall perennial herb up to 6 ft. high; flowers white in succulent inflorescences either terminating the leafy shoots or short leafless stems at their foot; in rain forest.

S. L.: Gberia Fotombu (Sept.) Small 286! Rokel R. Bridge (Apr.) Hepper 2565! Mokebi, Kori (May) Jordan 900! Bonjema, Kori (Dec.) Pyne 88! Bwedue (Apr.) Deighton 3172! **Lib.:** Brewerville (Nov.) Extends to Gabon.

[Ker-Gawler (in Reg. Bot. t. 683 (1823)) pointed out that lie obtained from seeds of his *C. afer* a number of plants with a great range of variation including some with a ring of hairs at the base of the ligule. Such plants were later separated as *C. lucanusianus* and it may be that Ker-Gawler used mixed seed, or population studies will prove that *C. lucanusianus* cannot be maintained as a species distinct from *C. afer*-F.N.H.]

CANNACEAE

Tall leafy perennial rhizomatous herbs. Leaves large, broad, pinnately nerved, with a distinct midrib. Flowers racemose or paniculate, bracteate, zygomorphic, bisexual, mostly large and brightly coloured. Perianth double, the outer calyx-like, the inner corolla-like. Sepals 3, imbricate, free, herbaceous. Petals 3, connate at the base and adnate to the staminal column. Stamens petaloid, 3 outer sterile, imbricate, 2 inner more or less connate, 1 free; anther solitary, 1-locular, adnate to the side of the petaloid portion. Ovary inferior, 3-locular; ovules numerous, axile. Fruit a capsule, pericarp often warted. Seeds many, rounded, with very hard endosperm.

Mainly in tropical and subtropical America.

CANNA

Linn., Sp. Pl. 1 (1753); F.T.A. 7: 327; Kränzlin in Engl., Pflanzenr. 4, 47 Cannac.: (1912).

- 1 Stems glabrous, erect; leaves ovate-elliptic, broadly acuminate, abruptly cuneate at the base, up to 40 cm. long and 25 cm. broad, glabrous, with numerous fine close parallel nerves diverging from the midrib at an angle of 45°; racemes terminal, few-flowered; pedicels very short; bracts ovate, about 1.3 cm. long; sepals lanceolate, 1.3 cm. long; petals linear-lanceolate, acute, about 4 cm. long; staminodes 3, one of them bidentate at the apex, spatulate-oblancheolate, about 4 cm. long; style as long as the staminodes, flattened; fruit closely muricate[indica](#)

Canna indica *Linn.* Sp. Pl. 1 (1763); Morton, W. Afr. Lilies & Orchids 52, fig. 62. *APD acc*

Canna indica subsp. *orientalis* (*Rosc.*) *Bak.* in F.T.A. 7: 328 (1898).

Canna orientalis *Rosc.* (1827).

Canna bidentata Bertol. (1859) -Kränzlin l.c. 46; F.W.T.A., ed. 1, 2: 335.

Herb 3-4 ft. high with scarlet or orange-red flowers.

The Indian Shot plant.

[Kränzlin (l.c.) recognised the tropical African plants as a distinct native species under the name of *C. bidentata* Bertol. But it is found in and near towns and villages, mainly in the forest belt, and it was presumably originally an escape from cultivation. It would seem better to regard the wild African plants as naturalised *C. indica*, a native of tropical America, and the cultivated plant as a stouter, finer form. D. P. Stanfield reports two forms sometimes occurring in mixed populations in Nigeria: form 1 with purplish leaf margins and red fruit, form 2 with leaves uniformly green and green fruits. L. Aké Assi also records two forms growing side by side in Ivory Coast.]

MARANTACEAE

Perennial herbs. Leaves in two rows, differentiated into an open sheath, stalk and blade, the stalk often winged, but terete and pulviniform towards the apex, this being referred to as the calloused portion (see Fig. 345), the blade sometimes with one straight and one curved side, with closely parallel numerous nerves diverging obliquely from the midrib. Flowers bisexual, asymmetric, in a terminal bracteate spike or panicle, or the inflorescence arising from the rhizome. Perianth mostly differentiated into calyx and corolla; outer segments free, inner more or less tubular, divided into 3 mostly unequal parts. Fertile stamen 1; anther 1-locular; staminodes variously petaloid. Ovary inferior, 3-1-locular, sometimes 2 of the loculi infertile; style stout, often dilated at the apex. Ovule solitary, erect. Fruit fleshy or a loculicidal capsule. Seeds with abundant endosperm and much incurved or folded embryo, and often with an aril.

Tropics and subtropics, mostly in moist or swampy primary forest.

- 1 Stems simple, usually bearing simple leaf and inflorescence, or stem absent with petiole arising from rhizome; petiole with no distinct circular groove at junction of petiole with the calloused portion; ovary and fruit smooth, not muricate:2
- Stems branched, sometimes repeatedly so to form a scrambling plant, leaves numerous; ovary and fruit 3-locular, smooth or muricate:8
- 2 Inflorescence arising at ground-level, 6-15 cm. long:3
- Inflorescence aerial; fruits more or less rounded or cylindrical, not winged:4
- 3 Inflorescence arising from the lowest node of the leaf, simple or forked; fruits 3-winged, 3 cm. diam.; leaves very large, 60 cm. or more long, 40 cm. broad [1. *Thaumatococcus*](#)
- Inflorescence arising separate from the leaves, simple; leaves up to 35 cm. long and 10 cm. broad [2. *Afrocalathea*](#)
- 4 Leaves strongly asymmetrical with one side nearly straight and the other rounded:5
- Leaves not strongly asymmetrical, both sides rounded:6
- 5 Fruit 3-seeded, more or less rounded; (see also below) [3. *Marantochloa*](#)
- Fruit 1-seeded, cylindrical; inflorescence with closely imbricated bracts and erect branches [4. *Halopegia*](#)
- 6 Ovary 1-locular with 1 erect ovule; fruit 1-seeded, the seed filling the cavity, arillate; inflorescences lax panicles; in open swamps [5. *Thalia*](#)
- Ovary 3-locular; inflorescence borne on a simple stem terminating in a single leaf; in shady places:7
- 7 Nodes of inflorescences each with 1 cymule; each bract enclosing the part of the inflorescence above it, caducous at anthesis; each cymule with 1 fleshy bracteole; fruit with well marked sutures; seed arillate [6. *Megaphrynium*](#)
- Nodes of inflorescences each with 2-4 cymules; bracts not enclosing the part of the inflorescence above it, persistent; each cymule with 2 fleshy bracteoles; fruit without obvious sutures; seeds without an aril [7. *Sarcophrynium*](#)
- 8 Junction of the petiole with the calloused portion marked by a distinct circular groove with thickening (see Fig. 345); ovary and fruit muricate:9
- Junction of the petiole with the calloused portion not marked by a circular groove, only marked by a change in texture; calloused portion uninterrupted with midrib on lower surface (see Fig. 345); fruits not muricate: 10
- 9 Calloused portion of the petiole separated from the midrib on the lower surface by a slight but distinct thickening and on the upper surface by a prominent beak; fruits indehiscent; seeds not arillate [8. *Hypselodelphys*](#)
- Calloused portion of petiole continuous with the midrib on the lower surface and not marked by any disjunction, and on the upper surface the junction with the midrib marked by an interruption but not beaked; fruits dehiscent; seeds arillate [9. *Trachyphrynium*](#)
- 10 Bracts suborbicular; stems often prickly; leaves hardly asymmetric, both sides curved [10. *Haumania*](#)
- Bracts oblong; stems not prickly; leaves strongly asymmetric with one side curved and the other side almost straight; cymules without fleshy bracteoles; seeds arillate: 11
- 11 Bracts acute; flowers at different levels; fruit ultimately dehiscent; inflorescence erect [3. *Marantochloa*](#)
- Bracts obtuse; flowers more or less side by side; fruits indehiscent; inflorescence more or less reflexed [11. *Ataenidia*](#)

Maranta arundinacea Linn.

The arrow-root, a native of tropical S. America, is widely cultivated in gardens in the forest zone of W. Africa.

1. THAUMATOCOCCUS

Benth. in *Benth. & Hook. f., Gen. Pl.* 3: 652 (1883); *F.T.A.* 7: 320.

- 1 Leaves ovate-elliptic, rounded-truncate at the base, shortly acuminate, up to 46 cm. long and 30 cm. broad, papery, with very numerous parallel nerves diverging from the midrib at an angle of about 45°; petiole subterete; spikes simple or forked, about 10 cm. long; bracts imbricate, 4 cm. long; flowers as long as the bracts; sepals broadly linear, 1 cm. long; corolla-tube very short, lobes oblong, 2.5 cm. long; ovary silky; fruit 3-winged, hard, 3 cm. diam.[daniellii](#)

Thaumatococcus daniellii (*Benn.*) *Benth.* l.c. (1883); *F.T.A.* 7: 321; *K. Schum.* in *Engl., Pflanzenr.* 4, 48: 40, fig. 8; *Chev. Bot.* 630; *Mangenot in Ic. Pl. Afr., I.F.A.N.* 4: 95 (1957); *Schnell in Bull. I.F.A.N.* 19: 1133 (1957); *Koechlin in Fl. Gabon* 9: 141, t. 30 (1964), and in *Fl. Cam.* 4: 144, t. 28 (1965). *APD acc*

Phrynium daniellii *Benn.* (1855).

Monostiche daniellii (*Benn.*) *Horan.* (1862).

Donax daniellii (*Benn.*) *Roberly* (1955), as (*Horan.*) *Roberty*.

A herb up to 10 ft. high; rhizome slender, creeping; spikes arising from the base, rough with the scars of fallen flowers, the latter pale purple; fruit crimson, at or below ground-level; seeds black, hard, shining; in large clumps in forest.

2. AFROCALATHEA

K. Schum. in *Engl., Pflanzenr.* 4, 48: 51 (1902). *APD acc*

- 1 Perennial rhizomatous herb; leaves in pairs or solitary from the rhizome, petiole about 12-60 cm. long, the calloused portion about 2 cm. long, continuous with the petiole and midrib beneath, interrupted above at junction with lamina, pubescent; lamina oblong-lanceolate, slightly asymmetrical, shortly acuminate at apex, deltoid at the base, 10-35 cm. long, 4-10 cm. broad, glabrous; inflorescences up to 15 cm. long, arising directly from the rhizome, 3-4-flowered, spicate with imbricate bracts; sepals linear, 1 cm. long; ovary densely pubescent[rhizantha](#)

Afrocalathea rhizantha (*K. Schum.*) *K. Schum.* l.c. (1902); *Koechlin in Fl. Gabon* 9: 134, t. 30 (1864), and in *Fl. Cam.* 4: 137, t. 28 (1965). *APD acc*

Calathea rhizantha *K. Schum.* (1892)-*F.T.A.* 7: 327.

Rhizomatous herb; flowers whitish; in forest.

S. Nig.: Unyene to Stubbs Creek F.R., Eket Dist. (Oct.) Daramola FHI 55320!

Also in **E. Cameroun** and **Gabon**.

3. MARANTOCHLOA

Brongn. ex Gris in *Bull. Soc. Bot. Fr.* 7: 321 (1860)

Clinogyne of *Benth.* in small part, not of *Salisb.*

Donax of *K. Schum.* in *Engl. Bot. Jahrb.* 15: 434, and of *Baker* in *F.T.A.* 7: 315, not of *Lour.*

Phrynium of *K. Schum.* (1902), and of *F.W.T.A.*, ed. 1, 2: 337, partly.

- 1 Inflorescence congested, about 5 cm. long and nearly as broad composed of numerous short branches, erect, sessile; bracts about 3 cm. long with several flowers to each bract, finely pubescent; leaves oblong-elliptic, rounded to a very slightly acute base, acumen eccentric, 14-31 cm. long, 6-14 cm. broad, with very numerous parallel lateral nerves, petiole up to 28 cm. long, the calloused portion 1.5-3.5 cm. long and shortly pubescent on the upper side, portion above sheath up to 8 cm. long [1. mannii](#)
- Inflorescence lax or spiciform: [2](#)
- 2 Leaves dissimilarly asymmetric, mirror image of the next above, i.e. asymmetry of the leaves on alternate sides in relation to the midrib (see Fig. 345A), 7-15(-25) cm. long; calloused portion of petiole 2-7 (-10) mm. long, pilose, sheath contiguous or almost so with callous portion; branchlets and nodes normally glabrous, sometimes villous; inflorescence lax and delicate, simple or with few branches, bracts and pedicels usually spreading at right angles to the glabrous rhachis; bracts 12-20 mm. long [2. congensis](#)
- Leaves all similar in their asymmetry (see Fig. 345B), or plant monophyllous: [3](#)
- 3 Aerial stems absent, leaf arising from rhizome: [4](#)
- Aerial stems bearing leaves: [5](#)
- 4 Inflorescences about 5 cm. long, very narrow, unbranched; ovary and fruit thinly pubescent; sepals broadly lanceolate, 3 mm. long; bracts about 1.5 cm. long, shortly pubescent; rhizomes bearing only one leaf; leaf oblong-lanceolate, slightly cordate or broadly and very shortly cuneate at the base, 21-30 cm. long, 7-12 cm. broad, with distinct transverse nerves between the numerous lateral nerves; calloused portion of petiole about 1 cm. long, sheathing part of petiole much shorter than the unsheathed portion [3. holostachya](#)
- Inflorescences 15-18 cm. or more long, apparently unbranched, upper bracts imbricate, 3 cm. long, folded half-width about 5 mm.; leaves solitary or paired from rhizome, petioles about 30-50 cm. long, slightly pubescent, calloused portion about 3 cm. long; lamina acuminate, rounded to truncate at base with cuneate portion at top of petiole, about 20 cm. long and 7 cm. broad, coriaceous, glossy above [4. sp. A](#)
- 5 Nodes and branchlets glabrous: [6](#)
- Nodes and branches pubescent: [7](#)
- 6 Leaves 7-16 cm. long, 3.5-7(-11) cm. broad; calloused portion of petiole 3-7 mm. long, shortly pubescent above, contiguous with sheath; inflorescence with slender rhachis simple or once branched; bracts 1.5-3.5 cm. long, caducous; sepals 2-5-6 mm. long; seeds 3-4 mm. long [5. filipes](#)
- Leaves 10-25 cm. long, 6-5-12 cm. broad; calloused portion of petiole 5-14 mm. long, shortly pubescent above, contiguous with sheath; inflorescence 1-3 times branched; sepals 5 mm. long; fruits spherical, 1 cm. diam. with 3 suture grooves, sparsely pubescent; seeds 5-6 mm. long [6. leucantha](#)
- 7 Inflorescences lax and well-branched, up to 20 cm. long, bracts about 3.5 cm. long, persistent: [8](#)
- Inflorescences narrow, 10-25 cm. long, simple or with erect narrow branches; seeds with laminate aril: [9](#)
- 8 Flowers white (see also above) [6. leucantha](#)
- Flowers deep purple; leaves broadly ovate-elliptic, truncate at the base, abruptly apiculate at apex, up to 40 cm. long and 20 cm. broad, calloused portion of petiole 1-6 cm. long, portion above sheath up to 7 cm. long (may be absent or very short in upper leaves only); fruits spherical, 8 mm. diam., pubescent [7. purpurea](#)
- 9 Inflorescence unbranched or usually only divided at the base, 3-4 cm. long, half width 4 mm., enclosing rather large white flowers; corolla-tube about 1 cm. long; stem much-branched; leaves oblong-elliptic, rounded to a very shortly cuneate or slightly cordate base, abruptly tailed-acuminate, up to 26 cm. long and 14 cm. broad [8. ramosissima](#)
- Inflorescence with several parallel branches; bracts more or less imbricate 3 cm. long, half width 3 mm.; corolla-tube about 5 mm. long; stems sparingly branched; leaves ovate to ovate-lanceolate or oblong, rounded to a very shortly cuneate base, abruptly tailed-acuminate at apex, up to 40 cm. long and 26 cm. broad [9. cuspidata](#)

Widespread in tropical Africa.

[The African plants have glabrous bracts and calyx and they are therefore regarded as a species distinct from the American *T. geniculata* Linn. in which they were formerly placed.]

Thalia dealbata Fraser

Cultivated in the Botanic Garden, Victoria, W. Cameroun.

6. MEGAPHRYNIUM

Milne-Redh. in Kew Bull. 7; 169 (1952).

Sarcophrynium K. Schum. (1902), partly-F.W.T.A., ed. 1, 2: 336, partly.

- 1 Inflorescence arising from a sheath up to 10 cm. below the calloused portion of the apical leaf petiole, borne on a simple stem 2-3 m. high; inflorescences up to 20 cm. long with a few lax branches, the branches spike-like and articulated with numerous nodes, cymules solitary at the nodes; bract enclosing the part of the inflorescence above it and caducous at anthesis; flowers side by side; bracteole solitary per cymule; outer staminodes lanceolate, linear, subulate or one absent; calyx-lobes free or more or less connate; fruit 3-lobed, 2 cm. diam. with conspicuous sutures, glabrous, tardily dehiscent; seeds arillate, not keeled, 16 by 10 mm.; leaves arising from the base with erect petioles 1-2 m. high, calloused portion up to 10 cm. long, lamina broadly ovate, rounded at base, shortly acuminate, up to 40 cm. long and 25 cm. broad *1. macrostachyum*

Inflorescence arising from a sheath 50-80 cm. below the calloused portion of the apical leaf petiole, borne on a simple stem 1 m. high; inflorescences about 8 cm. long, compact with few short branches; young fruits ciliate; seeds keeled, 12 by 8 mm. *2. distans*

1. *Megaphrynium macrostachyum* (Benth.) Milne-Redh. l.c. 170 (1952), and in F.T.E.A. Marantac.: 4; Koechlin in Fl. Gabon 9: 156, and in Fl. Cam. 4: 154, t. 31. *APD acc*

Trachyphrynium Benth. (1883), partly; F.W.T.A., ed. 1, 2: 337, partly.

T. subgen. *Hypselodelphys* K. Schum. in Engl., Pflanzenr. 4, 48: 42 (1902).

- 1 Inflorescences congested with several (often many) lateral branches arising from about the same point; bracts persistent, closely overlapping, acutely acuminate, about 3 cm. long; leaves elliptic, rounded at base, gradually acuminate, 12-14 cm. long, about 6 cm. broad, with numerous closely parallel lateral nerves; petiole sheathing in the lower 3/4, the upper quarter articulated in the middle with the calloused portion about 2 cm. long [1. zenkerana](#)
- Inflorescences loosely arranged, little-branched: **2**
- 2 Fruits acutely triangular, each side 4 cm. long, flattened, densely and shortly muricate; inflorescences usually zig-zag, (5-)8-16(-24) cm. long from lowest node, with internodes about 1 cm. apart; bracts 2-3.5 cm. long; flowers 2.5 cm. diam.; leaves oblong-elliptic, rounded-truncate at base, abruptly acuminate, 9-21 cm. long, 5-9 cm. broad, with numerous close parallel lateral nerves; petiole sheathing up to the junction with the calloused portion [2. violacea](#)
- Fruits 3-lobed with rounded comers, muricate: **3**
- 3 Tubercles of fruit short and dense, about 2 mm. long; fruit up to 4-5 cm. diam.; inflorescences nearly straight, 5-9 cm. long from the lowest node, with internodes about 5 mm. apart; bracts 2-3.5 cm. long; leaves oblong-elliptic to ovate-oblong, rounded-truncate at base, abruptly acuminate, 8-15 cm. long, 3-9 cm. broad, with numerous close parallel lateral nerves; petiole as the last [3. poggeana](#)
- Tubercles of fruit long and apparently less numerous, up to 5 mm. long, often curved; fruit up to 5 cm. diam.; inflorescence branches usually zig-zag, about 20 cm. long, with internodes about 1 cm. apart; bracts 3.5-4 cm. long; leaves elliptic, oblong-elliptic or ovate-elliptic, rounded-truncate at base, shortly acuminate, 12-35 cm. long, 5-17 cm. broad with numerous close parallel lateral nerves; calloused portion of petiole above articulation up to 3 cm. long; midrib pubescent or glabrous [4. scandens](#)

1. *Hypselodelphys zenkerana* (K. Schum.) Milne-Redh. in Kew Bull. 5: 161 (1960); Koechlin in Fl. Cam. 4: 109, t. 22. *APD acc*

Trachyphrynium zenkeranum K. Schum. in Engl., Pflanzenr. 4, 48: 45 (1902); F.W.T.A., ed. 1, 2: 337.

A bamboo-like plant in forest.

W. Cam.: Barombi Preuss 873. Buea Deistel 206; 504; 519. Preuss 873b. Dusen 415. Also in E. Cameroun.

[Although Schumann described the fruit as having globose cocci, Zenker 274 (BR) has a detached fruit with pointed cocci. Field observations and further careful collections are required to settle the question.]

2. *Hypselodelphys violacea* (Ridl.) Milne-Redh. l.c. 160 (1950); Koechlin in Fl. Gabon 9: 104, t. 23 (1964), and in Fl. Cam. 4: 112, t. 22 (1965). *APD acc*

Trachyphrynium violaceum Ridl. (1887)-F.T.A. 7: 320; K. Schum. l.c. 44; F.W.T.A., ed. 1, 2: 337.

T. preussianum K. Schum. (1892)-F.T.A. 7: 320.

Donax violacea (Ridl.) Roberty (1955);

Straggling climber with slender stems branching at all angles forming a tangle in forest about 12 ft. high; flowers violet and white.

S. L.: Potoru (Dec.) Deighton 3796! Sefadu, Bari (Nov.) Deighton 5272! Pujehun (Nov.) Deighton 5273! **Lib.:** Bushrod I. (Dec.) Barker 1100! Kakatown Whyte! Vahon, Kolahun Dist. (Nov.) \$/eflora

LILIACEAE

Herbs, mostly perennial, or rarely soft-wooded shrubs; roots from a rhizome, corm or bulb, or tuberous; stem erect or climbing, leafy or scapose. Flowers bisexual or rarely unisexual, actinomorphic or slightly zygomorphic, sometimes large and showy, never in umbels. Perianth mostly corolla-like, with or without a tube; segments usually 6, rarely 4 or more, in 2 similar series, imbricate or the outer valvate. Stamens usually 6, hypogynous or adnate to and always opposite to the perianth segments; filaments usually free; anthers 2-celled, usually opening by a slit lengthwise. Ovary superior, mostly 3-locular with axile placentas, or rarely 1-locular with parietal placentas; style entire or divided, rarely styles free. Ovules usually numerous and mostly 2-seriate in each loculus. Fruit a capsule or berry. Seeds with copious endosperm.

World-wide distribution, more abundant in temperate and subtropical regions.

- 1 Leaves large and fleshy, spiny on the margin; mflorescence up to 1 m. high [1. Aloë](#)
 Leaves not spiny on the margin, usually not fleshy: [2](#)
- 2 Leaves much reduced and scale-like, their function, fulfilled by linear and acicular cladodes; fruit a berry;
 flowers very small; rootstock rhizome with root tubers; stems wiry, often armed [2. Asparagus](#)
 Leaves not reduced to scales; branches not modified, into cladodes: [3](#)
- 3 Stems more or less climbing, leafy; leaves often tendriform at the apex; style spreading at a right angle from the
 top of the ovary [13. Gloriosa](#)
 Stems erect or much reduced; leaves not tendriform at the apex: [4](#)
- 4 Rootstock a rhizome or tuber (neither a bulb nor a corm); roots fibrous or sometimes thick and tuberous: [5](#)
 Rootstock a bulb or corm: [8](#)
- 5 Rootstock a bulb-like tuber, usually surmounted by numerous fibres; seeds villous; flowers on long pedicels .. [4. Eriospermum](#)
 Rootstock not thick and bulb-like, but sometimes the roots ending in tubers; seeds glabrous; pedicels not
 elongated: [6](#)
- 6 Fruits globose or shallowly lobed; seeds not flat: [7](#)
 Fruits deeply lobed; seeds compressed; inflorescence branched or subspicate; reddish mottling absent from the
 base of the leaves; widespread [6. Chlorophytum](#)
- 7 Perianth segments united into a tube; inflorescence a stout spike; highland [3. Kniphofia](#)
 Perianth segments free at the base; inflorescence slender, more or less branched; base of leaves more or less
 reddish mottled; widespread [5. Anthericum](#)
- 8 Perianth segments free to the base: [9](#)
 Perianth segments united at the base: [13](#)
- 9 Capsule more or less deeply lobed; corolla rotate [7. Urginea](#)
 Capsule shallowly lobed: [10](#)
- 10 Stamens hypogynous: [11](#)
 Stamens perigynous; flowers bluish or mauve; bulb [10. Scilla](#)
- 11 Raceme not spike-like, upper flowers fertile: [12](#)
 Raceme spike-like, upper flowers infertile; bulb [9. Drimiopsis](#)
- 12 Leaves basal; corolla more or less campanulate; bulb [8. Albuca](#)
 Leaves cauline; flowers long-pedicellate; corm [14. Iphigenia](#)

- 13 Outer perianth-segments markedly caudate-acuminate; bulb with white coloration; lowland and upland savanna [11. *Dipcadi*](#)
- Outer perianth-segments not caudate-acuminate: 14
- 14 Bulb with purplish coloration; seeds flattened; inflorescence many-flowered; upland savanna [12. *Drimia*](#)
- Tunicate corm; seeds subglobose; inflorescence 2-flowered; montane grassland [15. *Wurmbea*](#)

1. ALOË

Linn., Sp. Pl. 319 (1753); F.T.A. 7: 454; Keay in Kew Bull. 17: 65 (1963). *APD acc*

- 1 Leaf-bases not forming a bulb-like swelling; perianth pink or red; fruits, where known, not exceeding 2.5 cm. long: 2
- Leaf-bases forming an underground bulb-like swelling; plants never suckering; perianth green, yellow or orange or dull red, rounded at base, gradually constricted with the narrowest part about 1/3 length from base (see Fig. 348 K); fruits 3.7-4 cm. long; in grassy places in savanna woodland [4. *buettneri*](#)
- 2 Plants never suckering; lower leaves rosulate and spreading or lying on surface of ground; perianth with pronounced basal swelling truncate at base, abruptly constricted above the ovary with narrowest part about 1/4 length from base and enlarging to the throat (see Fig. 348 E, F); on rocky hills [1a. *macrocarpa* var. *major*](#)
- Plants often suckering; perianth rounded at base, cylindrical or very slightly constricted (see Fig. 348 N): 3
- 3 Leaves up to 8 cm. broad, grey-green; stems sometimes long; perianth about 2-8 cm. long, cylindrical; fruits 2.5 cm. long; on rocky hills [2. *schweinfurthii*](#)
- Leaves 10-12 cm, broad; stems short; perianth about 3 cm. long, very slightly constricted above ovary; Accra Plains [3. *keayi*](#)

1. *Aloë macrocarpa* *Todaro* Hort. Bot. Panorm. 1: 36, t. 9 (1875); F.T.A. 7: 462; Reynolds, Aloes Trop. Afr. 91 (1966). *APD acc*

In *Eritrea* and *Ethiopia*.

1a. *Aloë macrocarpa* var. *major* *A. Berger* in Engl., Pflanzenr. 4, 38, 3, 2: 210 (1908); Keay in Kew Bull. 17: 67 (1963); Reynolds l.c. fig. 98.

APD: *Synonym of Aloë macrocarpa* *Tod.*

Aloë edulis *A. Chev.* in Rev. Boo. Appliq. 31: 592, t. 32A (1952), French descr. only.

Aloë barteri of Schnell in Ic. Pl. Afr. t. 23 (1953), not of Bak.

A perennial herb with fleshy leaves up to about 11/2 ft. long and 4 in. broad, margins sharply toothed, leaf-surfaces strongly mottled and becoming reddish in the dry season; perianth dull scarlet; among rocks.

Dah.: Somba, Atacora Mts. (cult., June) Chev, 24157! *N. Nig.*: Pankshin, 5,100 ft. (July) Lely 433! Jos (Mar-Oct.) Batten-Poole FHI 12874a! Keay FHI 22725! Latilo FHI 25326!

Extending to C. African Rep., Congo, [Angola](#), Zambia and Malawi.

Aloë barbadensis Mill. *APD acc*

Besides the indigenous species, two forms of what appears to be this species are cultivated in Sierra Leone (Freetown and Njala) and at Victoria, W. Cameroun.

2. ASPARAGUS

Linn., Sp. Pl. 313 (1753); F.T.A. 7: 435. APD acc

- 1 Flowers in racemes; cladodes flattened and more or less falcate; branches smooth and glabrous; spines short and recurved, only on the main shoots:2
- Flowers fasciculate or solitary; cladodes subulate or filiform (flattened in *A. schroederi*), straight or nearly so: .3
- 2 Pedicels jointed about or above the middle, about 5 mm. long in flower; cladodes about 2 cm. long and 1 mm. broad; racemes about 3 cm. long usually paired or solitary[1. racemosus](#)
- Pedicels jointed nearly at the base, about 5 mm. long in flower; cladodes about 4 cm. long and 2 mm. broad; racemes about 5 cm. long, often clustered[2. warneckeii](#)
- 3 Pedicels filiform 3-15 mm. long; branches smooth, terete or angular, glabrous or pubescent:4
- Pedicels short and stout, about 3 mm. long, jointed about the middle; stems glabrous, angular and minutely scabrid on the angles:7
- 4 Pedicels jointed above the middle, about 15 mm. long; perianth 5 mm. long; branchlets very slender; cladodes filiform, over 2 cm. long[3. longipes](#)
- Pedicels jointed below the middle:5
- 5 Leaf spines mostly limited to the nodes from which the principal branches arise, strongly reflexed; younger branches densely velvety pubescent; cladodes 1-2 cm. long, subulate, rather numerous at each node; pedicels 5 mm. long; perianth 4 mm. long[4. pubescens](#)
- Leaf spines at most node, acute:6

- 6 Cladodes 2-4 cm. long, filiform; branchlets glabrous; pedicels 7 mm. long; perianth 2-5 mm. long[5. *schweinfurthii*](#)
 Cladodes about 1-1 1/2 cm. long, subulate, stiff; branchlets glabrous or pubescent, smooth and rounded; pedicels 4 mm. long in flower; perianth 2 mm. long[6. *flagellaris*](#)
- 7 Cladodes rigidly subulate, sharply angular 1(-2) cm. long; spines very short and curved from a broad base[7. *africanus*](#)
 Cladodes flattened, more or less triangular in section, about 2 cm. long; spines fairly long, slightly curved[8. *schroederi*](#)

Besides the above indigenous species, *A. sprengeri* Regel, from Natal, and *A. plumosus* Bak., from E. Africa, are cultivated as ornamental plants.

1. ***Asparagus racemosus* Willd.** Sp. Pl. 2: 152 (1799); Chev. Bot. 645. *APD acc*

Climbing plant up to 6 ft. high in thickets; flowers green or white; berries red.

Port.G.: Sonaco (Oct.) Pereira 3333! **Guin.:** Kaba to Haut-Mamou Chev. 12752! Farana Chev. 13175! Diaguissa Chev. 13472! **S. L.:** Konta, Kambia Dist. (Apr.) Hepper 2647! Dawa Mate Kole (Jan.) A. S. Thomas D79! Achimota & Aburl (cult.) Irvine 2028! **S. Nig.:** Yoruba Millson 25!

Widespread in the drier parts of tropical Africa and in tropical Asia.

2. ***Asparagus warneckei* (Engl.) Hutch.** in Kew 1939: 245; Morton, Lilies & Orch. fig. 18. *APD acc*

Asparagus drepanophyllus var. *warneckei* Engl., Bot. Jahrb. 32: 87 (1902).

Climber on shrubs in thickets; leafless at flowering time; flowers white or creamy with strong sickly odour.

Guin.: Pita (Nov.) Pobéguin, **Ghana:** Accra-Dodowah Plains (Feb.) Irvine 1502! Achimota (Dec.) Milne-Redh. 5176! Akpabla 1265! Accra to Aburi (Apr.) Baldwin 11989! **Togo Rep.:** Lomé Warnecke 28

3. ***Asparagus longipes* Bak.** in Kew Bull. 1901: 134. *APD acc*

Slender climbing unarmed plant with pale green-brown flowers.

W.Cam.?: "Cameroon Mountains."

Imported by Messer. Sanders of St. Albans, and flowered at Kew in Nov. 1898. Also cultivated at Achimota, Ghana, in 1936 (Akpabla 485!). Further information is required about the origin and occurrence of this species.

4. ***Asparagus pubescens* Bak.** in Trans. Linn. Soc. ser. 2, Bot. 1: 254 (1878); F.T.A. 7: 430.

APD: *Synonym of Asparagus africanus* var. *puberulus* (Baker) Sebsebe

Trailing or climbing much-branched plant 4-9 ft. high, only the main branches bearing acutely reflexed spines; flowers white.

N. Nig.: Jos Plateau (Apr.) Lely P222! **S. Nig.:** Shaki, Oyo Prov. Keay FHI 37574!

Also in **E. Cameroun**, **Zambia**, **S. Rhodesia**, **Bechuanaland** and **Angola**.

5. ***Asparagus schweinfurthii* Bak.** in J. Linn. Soc. 14: 616(1875); F.T.A. 7: 429.

APD: *Synonym of Asparagus flagellaris* (Kunth) Baker

Erect armed shrub about 4 ft. high branched in the upper part; [in upland grassland among rocks](#).

W.Cam.: Bum, Bamenda Div., 4,000 ft. (fr. Mar) Maitland 1702! Kimbi R. bridge 3,000 ft. Brunt 1016!

Also in **E. Cameroun**, **C. African Rep.** and **Sudan**.

6. ***Asparagus flagellaris* (Kunth) Bak.** in J. Linn. Soc. 14: 614 (1875); F.T.A. 7: 430; Chev. Bot. 644. *APD acc*

Asparagopsis flagellaris Kunth, Enum. Pl. 5: 103 (1850).

Asparagus pauli-guilelmi Solms-Laub. (1867)-F.T.A. 7: 428, incl. var. *daltoni* Bak. (1875); F.W.T.A., ed. 1, 2: 352; Berhaut, Fl. Sén. 53.

Asparagus africanus of Chev. Bot. 644, not of Lam.

Climbing or more or less erect plant with arching spiny branchlets; flowers white, fragrant; fruits orange when ripe.

3. KNIPHOFIA

Moench., Meth. 631 (1794); F.T.A. 7: 450. *APD acc*

Notosceptrum Benth. (1883)-F.T.A. 7: 454; F.W.T.A., ed. 1, 2: 342.

- 1 Leaves in a basal tuft and forming a cylindrical "tube" at the base, linear, up to 60 cm. long and 1.5 cm. broad, glabrous except the minutely scabrid margin, closely nerved; spike stout, about 60 cm. long, the upper two-thirds bearing subsessile flower, the latter rather dense; bracts boat-shaped, soon reflexed, 6 mm. long, scabrid on the margin; perianth campanulate, 1 cm. long, 6-lobed, lobes half as long as the tube, obtusely triangular, 1-nerved to the base of the tube; ovary broadly ovoid, glabrous; style entire, a little longer than the ovary
.....*reflexum*

Kniphofia reflexum Hutch. ex Codd in Bot. Notis. 120: 44 (1967). *APD acc*

Scitosceptrum reflexum Hutch., F.W.T.A. ed. 1, 2: 342 (1936), English descr. only.

A tufted perennial herb with a single sterile inflorescence about 2 ft. high; flowers small, campanulate, yellow.

W. Cam.: Lakom, Bamenda, 6,000 ft. (Apr.) Maitland, 1624!

"scattered in considerable numbers in the grass on the plateau" (Maitland).

4. ERIOSPERMUM

Jacq., Collect. Suppl. 72 (1796); F.T.A. 7: 470. *APD acc*

- 1 Tuber bulb-like or somewhat irregular in shape, crowned by the fibrous remains of the leaf-bases; leaves 1-3, long-petiolate, linear-lanceolate, acute at each end, about 15 cm. long and 1-1.3 cm. broad, markedly nerved, glabrous; raceme about 25 cm. long, slender; pedicels ascending, the lower up to 10 cm. long in fruit; perianth-segments about 8 mm. long, narrowly oblanceolate; capsule obovoid, 8 mm. long; seeds densely villous [abyssinicum](#)

Eriospermum abyssinicum *Bak.* in J. Linn. Soc. 15: 263 (1876); F.T.A. 7: 471; Troupin in Expl. Parc Nat. Garamba 4: 196; Morton, Lilies & Orch. t. 8. *APD acc*

Eriospermum elatum *Bak.* in F.T.A. 7: 471 (1898).

Eriospermum togoense *Dammer* (1905).

Hypoxis villosa of Chev. Bot. 635, partly (Chev. 937, 978), not of Linn. f.

Tuber giving rise to an inflorescence about 1 ft. high towards the end of the dry season with long-pedicellate yellow flowers which, open in the morning or late afternoon; the erect leaf grows later, in rocky savanna.

Sen.: Tambacounda Berhaut 1658! Ouassadou Berhaut 2154! **Guin.:** Samballo Adam 14837! **Iv. C.:** Bouna Reserve (Apr.) Aké Assi 8666! **U. Volta:** Banankalidoro to Bama Chev. 937! Widespread in the savanna of tropical Africa and as far south as Transvaal.

5. ANTHERICUM

Linn., Sp. Pl. 310 (1753); F.T.A. 7: 477. *APD acc*

- 1 Rhachis of the inflorescence pubescent or puberulous:2
Rhachis of the inflorescence glabrous:3
- 2 Leaves linear, expanding to the base, about 12-40 cm. long and 8-14 mm. broad in the middle, often arcuate, minutely serrulate-scabrid on the margins, closely nerved; inflorescence shorter than the leaves, axillary; lower bracts up to 1 cm. long; pedicels 5-10 mm. long1. [pubirhachis](#)
Leaves lanceolate, narrowed towards the base, 8-15(-30) cm. long and about 2 cm. broad, thin and with cross veins visible between the rather widely spaced nerves, minutely serrulate-scabrid on the margins and on some nerves beneath; inflorescence shorter than the leaves, terminal; lower bracts about 2 cm. long; pedicels up to 4 mm. long2. [subpetiolatum](#)
- 3 Peduncle winged:4
Peduncle not winged:7
- 4 Inflorescence unbranched; pedicel jointed near the base; fruits 7 mm. long, closely ribbed:5
Inflorescence branched; fruits 5 mm. long, coarsely ribbed:6
- 5 Perianth about 1 cm. long; flowers congested near the apex of the inflorescence; bracts about 10 mm. long, decreasing in size upwards to about 5 mm., acutely acuminate; leaves narrowly linear-oblanceolate, about 30 cm. long and 2(-3) cm. broad, closely nerved with about 25 nerves on each side of the midrib, not transversely barred with purple towards the base3. [pterocaulon](#)
Perianth about 1.5 cm. long, flowers close together towards apex of the inflorescence; bracts 1.5-4 mm. long, gradually pointed; leaves linear, about 40(-70) cm. long, 6-16 mm. broad, very closely nerved, leaf sheaths transversely barred with purple towards the base4. [uyuiense](#)
- 6 Inflorescence with several branches more than 3 cm. long; flowers usually paired, pairs about 1 cm. apart; pedicels jointed near the base; perianth 6 mm. long; leaves as long as or shorter than the panicle, linear, 1-1.5(-2.5) cm. broad, minutely scabrid on the margins, with about 20 lateral nerves on each side of the midrib5.

limosum

Inflorescence shortly branched, branches up to 2.5 cm. long; flowers congested on branches, several flowers together; pedicels jointed in the middle; perianth 8 mm. long; leaves narrowly linear, about 5 mm. broad, with about 5 lateral nerves on each side of the midrib [6. zenkeri](#)

7 Pedicels jointed near the base or at least below the middle: **8**

Pedicels jointed near the top or at least above the middle: **10**

8 Leaf sheaths mottled towards the base; lower part of lamina and upper part of leaf sheaths ciliate-bristly; leaves linear up to 5 mm. broad; inflorescence paniculate to more or less simple, slender; pedicels very short; perianth 8-10 mm. long; fruit up to 6 mm. long, transversely ribbed [7. dalzielii](#)

Leaf-sheaths un-mottled: **9**

9 Inflorescences ascending, usually with a few equal branches from near the base spreading in opposite directions, very slender, about 20 cm. long usually less, flowers few, evenly spaced; perianth 3-4 mm. long; pedicels up to 5 mm. long in fruit; fruits about 4 mm. broad; leaves as long as the inflorescences, 2-3 mm. broad [8. warneckeii](#)

Inflorescences erect, 23-52 cm. high, flowers few towards apex; bracts broadly ovate hyaline; pedicels about 6 mm. long; perianth-segments 7 mm. long; fruits 5 mm. diam., strongly ribbed; leaves linear 3 mm. broad, shorter than the inflorescence [9. immaculatum](#)

10 Lamina conspicuously setose on the margins [10. sp. A.](#)

Lamina glabrous at most scabrid-ciliolate on the margin (in *A. caulescens*), leaf sheaths glabrous or setose (in *A. nigericum*); pedicels jointed above the middle: **11**

11 Inflorescence erect, branched (or sometimes simple in *A. nubicum*): **12**

Inflorescences deflexed and curved, simple, appearing with and shorter than the leaves: **13**

12 Leaves present at flowering time, linear, 2-2.5 cm. broad; inflorescences well-branched, slender, up to 60 cm. high; bracts narrow, small; pedicels 1-1.5 cm. long in fruit; perianth 1 cm. long, segments narrow; fruits 4 mm. long, 6 mm. broad, transversely ribbed [11. caulescens](#)

Leaves absent at flowering time; leaves linear up to 1 cm. broad; inflorescences simple or branched, up to about 35 cm. long, with scarious leaf sheaths and bracts; pedicels 1 cm. long; perianth 1-2 cm. long, segments rather broad; fruits 7 mm. diam. with a few transverse oblique ribs [12. nubicum](#)

13 Margins of leaf sheaths glabrous, lamina linear, about 20 cm. long, 3-4 mm. broad, long-tailed at apex; inflorescence-rhachis angular; bracts about 5 mm. long, flowers usually paired; fruits nearly oblong, 9 mm. long, 6 mm. broad, surfaces lightly veined, sutures thickened [13. inconspicuum](#)

Margins of leaf-sheaths setose, lamina linear, about 20 cm. long, 2 mm. broad; inflorescence-rhachis cylindrical; bracts 2 mm. long [14. nigericum](#)

1. *Anthericum pubirhachis* Bak in J. Linn. Soc. 15: 302 (1876); F.T.A. 7: 481; Berhaut, Fl. Sén. 182, 186.

APD: Synonym of Chlorophytum affine Baker var. affine

***Dasystashys graminea* A. Chev.**, Bot. 652 (1920), name only.

Small rhizomatous herb with arching leaves and sometimes recurved inflorescences; flowers white.

Sen.: Kounpentoum (June) Trochain 3675! Nickolo-Koba (June) Adam 14162! **Mali:** Baguineda (fr. Aug.) Roberty 2594!

Guin.: Kouroussa (June) Pobéguin 293! **Ghana:** Yendi (Apr.) Morton GC 9081! **Dah.:** Nioro to Kouandé, Atacora Mts. Chev. 24010! **N. Nig.:** Nupe Barter! Zaria to Jos (fl. & fr. June) Stanfield FHI 54823! **S. Nig.:** Upper Ogun, N. of Iseyin (May) Stanfield 59874!

Extends to E. Cameroun, C. African Rep. and? Congo.

2. *Anthericum subpetiolatum* Bak. in J. Linn. Soc. 15: 302 (1876); Troupin, Fl. Sperm. Parc Nat. Garamba 1: 184.

APD: Synonym of Chlorophytum subpetiolatum (Baker) Kativu

***Anthericum limbamenense* Engl. & K. Krause** in Engl., Bot. Jahrb. 45: 126 (1910); F.W.T.A., ed. 1, 2: 341.

Small herb with a short inflorescence of white flowers.

N. Nig.: Abuja, Niger Prov. (July) Latilo FHI 54857! Jos Plateau (July) Lely P354! Bukure to Hephham Lely 350! Birni, Kwaya Dist., Bornu (Aug.) Daggash FHI 24856!

Widespread in the savanna of eastern tropical Africa.

3. *Anthericum pterocaulon* Welw. ex Bak. in Trans. Linn. Soc., ser 2, 1: 258 (1878).

APD: *Synonym of Chlorophytum cameronii* var. *pterocaulon* (Welw. ex Baker) Nordal

Anthericum korrowalense Engl. & K. Krause in Engl., Bot. Jahrb. 45: 125 (1910); F.W.T.A., ed. 1, 2: 341; Troupin, Fl. Sper. Parc Nat. Garamba 1: 184.

Anthericum atacorens A. Chev., Bot. 648 (1920), name only.

A rather stout herb with erect inflorescence about 1 ft. high; flowers white; in damp places in savanna

Dah.: Bokorono to Kouandi, Atacora Mts. (June) Chev. 24219! **N. Nig.:** Anara F.R., Zaria Prov. (May) Keay & Mutch FHI 22927! Zaria to Samara (fl. & fr. July) Keay FHI 25923! Wana (fl. & fr. June, Aug.) Hepburn 111a! Keana, Benue Dist. Hepburn 56! Tola (Oct.) Shaw 97!

4. *Anthericum uyuiense* Rendle in J. Linn. Soc. 30: 415 (1894); F.T.A. 7: 485; Troupin in Bull. Jard. Bot. Brux. 25: 233 (1955), and in Fl. Sper. Parc Nat. Garamba 1: 185, fig. 30.

APD: *Synonym of Chlorophytum cameronii* (Baker) Kativu var. *cameronii*

Anthericum speciosum of F.W.T.A., ed. 1, 2: 341, not of Rendle.

Anthericum koutiense A. Chev. in Mém. Soc. Bot. Fr. 2, 8: 89 (1908).

Leaves and inflorescence appearing together, 1-2 1/2 ft. high; flowers white.

U. Volta: Zorgongo to Ouagnan, Mossi Chev. 24635! **Ghana:** Djowany, Gambaga Dist. (June) Akpabla 699! **Dah.:** Koussokonigou, Atacora Mts. (June) Villiers! Also in **E. Cameroun** and **Angola**.

6. *Anthericum zenkeri* Engl. Bot. Jahrb. 32: 91 (1902).

APD: *Synonym of Chlorophytum staudtii* Nordal

Slender herb with erect inflorescences 1-2 ft. high and grass-like leaves; flowers pale white.

N. Nig.: Vogel Peak, Sardauna Prov., 5,000 ft. (fl. & fr. Nov.) Hepper 1510!

Also in **E. Cameroun**.

7. *Anthericum dalzielii* Hutch. ex Hepper in Kew Bull. 22: 456. fig. 5, 1-3 (1968); F.W.T.A., ed. 1, 2: 342 (1936), English descr. only.

APD: *Synonym of Chlorophytum dalzielii* (Hutch. ex Hepper) Nordal

Leaves about 1 ft. high with the inflorescence taller sometime densely fibrous at the base; leaf sheaths conspicuously red-mottled; flowers white; in sandy places.

N. Nig.: Bukuru, Jos Plateau (fl. & fr July) Lely 459! Tangale-Waja, Bauchi Prov. (May) G. V. Summerhayes 64! S. of Keana Hepburn 54! Abinsi (June) Dalz. 854!

8. **Anthericum warneckeii** Engl. Bot. Jahrb. 32: 91 (1902); Morton, W. Afr. Lilies & Orch. fig. 11.

APD: *Synonym of Chlorophytum warneckeii* (Engl.) Marais & Reilly

Anthericum deightonii Hutch. ex Berhaut, Fl. Sén. 184 (1954), French descr. only.

Small herb with grass-like leaves; inflorescence arching near the ground; flowers small, white; amongst grass.

Sen.: Tamhacounda Berhaut 1644! **Guin.:** Kourousaa (fl. & fr. June) Povéguin 1116! **Ghana:** Elmina (fl. & fr. July) Hall 1523! Accra (Mar.) Deighton 584! Achimota (fl. & fr. May) Irvine 1771! Adidome to Ho (fl. & fr. Apr.) Morton A3218!

Togo Rep.: Schlickboden, near Lomé (May) Warnecke 304. Also in Gabon.

9. **Anthericum immaculatum** Hepper in Kew Bull. 22: 458. fig. 6, 1-3 (1968).

APD: *Synonym of Chlorophytum immaculatum* (Hepper) Nordal

Slender herb about 1 ft. high with white flowers

Sen.: Oussouye, Casamance (fl. & fr. July) Berhaut 6178! Diouloulou (fl. & fr. Sept.) Adam 18213! Kédougou (June) Adam 14422! **Port.G.:** Dandum to Saber Capeidje (June) Esp. Santo 2922! **Guin.:** Sambailo (July) Adam 14843!

10. **Anthericum sp. A.**

Anthericum deflexum A. Chev., Bot. 648 (Chev. 938); Hutch., F.W.T.A., ed. 1, 2: 342 (1936), English descr. only, not of A. Chev. (1913).

Small herb with narrow conspicuously ciliate leaves.

Mali: Banankalidoro to Bama (June) Chev. 938!

[Further material is required to establish the identity of this plant.]

11. **Anthericum caulescens** Bak. in J. Linn. Soc. 15: 303 (1876).

APD: *Synonym of Chlorophytum caulescens* (Baker) Marais & Reilly

Herb with rather broad leaves and tuberous roots; flowers inconspicuous dull green on a branched inflorescence; in dry rocky ground.

N. Nig.: Nupe Barter 1515! Ilorin to Jebba (fr. June) Onochie FHI 40253!

12. **Anthericum nubicum** Bak. l.c. 301 (1876); F.T.A. 7: 484; Milne-Redhead in Kew. Bull. 3: 471 (note under *Urginea glaucescens*).

APD: *Synonym of Chlorophytum nubicum* (Baker) Kativu

Anthericum fibrosum Hutch., F.W.T.A., ed. 1, 2: 342 (1936), English descr. only; Hepper in Bull. I.F.A.N. 27: 504 (1965).

Anthericum articulatum Hutch. l.c. (1936), English descr. only, partly (Lely 690).

Perennial herb with a fibrous corm flowering leafless or nearly so with slender usually unbranched inflorescences a few inches to 1 1/2 ft. high bearing scale leaves; flowers white with a pink median stripe on each tepal; flowering in the dry season in savanna grassland.

Guin.: Kouroussa (Jan.) Pobéguin 629! 635! Labé (Apr.) Chev. 12306! **N. Nig.:** Kontagora (Jan.) Dalz. 261! Minna (Jan.) Onochie FHI 40852Q! Vom (Feb.) McClintock 204! Naragata (Nov.) Lely 690! Wana (Apr.) Hepburn 111b! Yola (fl. & fr. Feb.) Dalz. 230! Vogel Peak (Nov.) Hepper 1388! **S. Nig.:** Kishi to Igreti, Oyo Dist. (Feb.) Keay FHI 22497!

Extending to Sudan and Uganda.

13. **Anthericum inconspicuum** Bak. in J. Bot. 15: 71 (1877); F.T.A. 7: 480.

APD: *Synonym of Chlorophytum filifolium* Nordal & Thulin

APD: Synonym of Chlorophytum inconspicuum (Baker) Nordal

Small herb with arching grass-like leaves about 8 in. high; inflorescence arching and bearing small flowers.

Sen.: Ngor (fl. & fr. July) Berhaut 4768!

Extending to **Somalia**.

14. Anthericum nigericum Hepper in Kew Bull. 22: 459, fig. 5, 4-6 (1968).

APD: Synonym of Chlorophytum angustissimum (Poelln.) Nordal

A slender perennial herb with short fat root tubers and very narrow leaves; inflorescence angled near the base 6-8 in. long, about the same length as the leaves; flowers white; **in rocky savanna**.

N. Nig.: Anara F.R., Zaria Prov. (July) Keay FHI 37081! Jos Plateau (Aug.) Lely P575!

6. CHLOROPHYTUM

Ker-Gawl. in Bot. Mag. t. 1071 (1807); F.T.A. 7: 493. *APD acc*

- 1** Pedicels jointed near the top or at least above the middle: **2**
 Pedicels jointed at or below the middle: **11**
- 2** Inflorescence stout, subspicate or congested lateral racemes or rarely with one branch, not paniculate: **3**
 Inflorescence slender, aniculate or if simple then leaves distinctly petiolate:4 **6**
- 3** Leaves linear, 1-2 cm. broad, up to 45 cm. long, ciliate; flowering part of inflorescence 20-35 cm. long: **4**
 Leaves lanceolate or linear-lanceolate, 3-8 cm. broad: **5**
- 4** Bracts pectinate-ciliate, linear-filiform from a broader base, about 1 cm. long; leaves up to 2 cm. broad **1.**
[*senegalense*](#)
 Bracts not ciliate, triangular-ovate, shortly acuminate; perianth 1 cm. long; leaves up to 1.5 cm. broad with about 20 closely parallel nerves **2.**
[*aureum*](#)
- 5** Leaves lanceolate to oblanceolate, erect, long-acuminate, attenuate towards the base into an indistinct petiole and broadening to the point of insertion, up to 60 cm. long from base to apex, up to 8 cm. broad; peduncle 12-30 cm. long, apparently elongating in fruit up to 40(-60) cm. long, flowers congested in upper third; fruits 7-10 cm. long **3.**
[*macrophyllum*](#)
 Leaves linear-lanceolate, close to ground, acute at apex, broadly petiolate, up to 40 cm, long from base to apex, about 4 cm. broad; inflorescence about 1/3 as long as the leaves, a continuous dense raceme about 8 cm. long; bracts almost imbricate, ribbed, 1 cm. long; fruits 5 mm. long **11.**
[*stenopetalum*](#)
- 6** Leaves linear or nearly so, 1-2 cm. broad, up to 80 cm. long, inflorescence a well-branched panicle longer than the leaves, rhachis not scabrid: **7**
 Leaves not linear, 2-5 cm. broad: **9**
- 7** Lobes of fruit divergent, cuneate to the base, whole fruit 4 mm. long, 6 mm. broad, strongly nerved; perianth 4 mm. long **4.**
[*polystachys*](#)
 Lobes of fruit rounded, lobed at base, whole fruit 3 mm. long, 5 mm. broad, more or less nerved; perianth 6 mm. long: **8**
- 8** Inflorescences much-branched panicles; pedicels up to 5 mm. long **5.**
[*altum*](#)
 Inflorescences sparingly branched usually with 3 equal branches up to 20 mm. long; pedicels 10-12 mm. long **6.**
[*nzii*](#)
- 9** Rhachis of inflorescence smooth, more or less branched; fruits broader than long: **10**
 Rhachis of inflorescence minutely scabrid, simple, about as long as the leaves; perianth about 8 mm. long; fruits as long as or longer than broad, longitudinally broadly elliptic, 8 mm. long; leaves lanceolate, very acute, up to 30 cm. long and 4 cm. broad, with about 9 lateral nerves on each side of the midrib **9.**
[*inornatum*](#)
- 10** Leaves indistinctly petiolate4 linear-lanceolate, 30-45 cm. long, 3-5 cm. broad, with undulate margins, very thin and with numerous slender transverse veins; inflorescences paniculate or with a few slender branches; perianth 5 mm. long; fruit 4-5 mm. long, 5-6 mm. broad (see also *C. laxum*, below) **7.**
[*gallabatense*](#)
 Leaves with a distinct slender petiole about as long as the lanceolate lamina, leaf variable in length, 10-40 cm. long, 2-4 cm, broad, very acute with about 6 lateral nerves on each side of the midrib; inflorescences slender,

- usually much longer than the leaves with a few slender branches or more or less simple; perianth 4 mm. long; fruit 4-6 mm. long, 5-7 mm. broad [8. togoense](#)
- 11** Leaves ciliate, at least towards the base: **12**
 Leaves not ciliate: **13**
- 12** Inflorescence racemose or shortly branched, axis 10-40 cm. long, smooth; bracts subulate-lanceolate, about 1 cm. long, the lower ones much longer, caducous; perianth 8 mm. long; fruits suborbicular, about 1 cm. diam.; leaves linear-lanceolate, erect, the base nearly as broad as the lamina in young plants, older ones narrowed to a petiole and up to 40 cm. long with about 15 nerves on each side of the midrib [10. blepharophyllum](#)
 Inflorescence subcapitate, up to 4 cm. long, with short congested branches; bracts lanceolate less than 1 cm. long, ribbed; perianth 5 mm. long; leaves forming a rosette, lanceolate-elliptic, 12-21 cm. long, 2.5-6 cm. broad, usually distinctly petiolate, petiole 3-6 cm. long [12. geophilum](#)
- 13** Leaves appressed to ground, ovate or ovate-lanceolate, sessile, 5-10 cm. long, 2-4 cm. broad, with about 12 lateral nerves on each side of the midrib; inflorescence very short and subsessile in the cluster of leaves; fruits suborbicular, 5 mm. diam. [13. pusillum](#)
 Leaves erect, not as above: **14**
- 14** Petiole long and distinct: **15**
 Petiole not clearly developed: **18**
- 15** Axis of inflorescence minutely scabrid, usually longer than the leaves, few-flowered with the flowers widely spaced, simple, often arcuate and viviparous; fruits about 5 mm. diam.; leaves obovate to oblanceolate, very acutely acuminate, thin, about 15 cm. long, 3-7 cm. broad; petiole about as long as the lamina [14. sparsiflorum](#)
 Axis of the inflorescence smooth: **16**
- 16** Leaves ovate to ovate-lanceolate, 15-35 cm. long, 5-10 cm. broad, with about 20 strong nerves; inflorescence branched, as long as or longer than the leaves; perianth 6 mm. long, segments linear; fruits suborbicular, 7 mm. diam.; pedicels jointed in the middle [15. orchidastrum](#)
 Leaves smaller, linear to oblanceolate; pedicels jointed below the middle: **17**
- 17** Leaves linear or narrowly linear-oblanceolate, very gradually narrowed to the base, 6-23 cm. long, 1-2 cm. broad, thin, with about 5 parallel nerves on each side of the midrib; inflorescences very slender, shorter than the leaves and with a few short branches; bracts all as long as or longer than the pedicels; fruits suborbicular, 5 mm. diam. [16. laxum](#)
 Leaves lanceolate, rather abruptly narrowed into the petiole, the lamina (4-)6-14 cm. long, 1.5-3.5 cm. broad, with about 8 parallel nerves on each side of the midrib; inflorescences slender, as long as the leaves, more or less branched; bracts (except the lowermost) much shorter than the pedicels; fruit obovate, the lobes appearing divergent, about 5 mm. long and 9 mm. broad [17. alismifolium](#)
- 18** Segments of perianth nearly 2 cm. long, 4 mm. or more broad; pedicels jointed in the middle; inflorescence usually simple, about as long as the leaves; bracts ovate, long-acuminate, as long as or longer than the flowers; fruits oblong-elliptic, 1.3 cm. long; leaves linear, 1-2.5 cm. broad [18. tuberosum](#)
 Segments of perianth up to 1 cm. long, linear: **19**
- 19** Pedicels 1-1.5 cm. long: **20**
 Pedicels a few mm. long: **21**
- 20** Fruit broader than long, 5 mm. broad, 3 mm. long; pedicels about 1 cm. long in flower, slightly longer in fruit; perianth segments 6 mm. long; inflorescence up to 57 cm. long, usually with 3 equal branches up to 20 cm. long; leafy at flowering time, leaves linear lanceolate, about 1.5 cm. broad, acute [6. nzii](#)
 Fruits about as broad as long, nearly square in outline, 7-8 mm. diam.; perianth segments linear-filiform, 1 cm. long; inflorescences up to 80 cm. long with several long branches; bracts 2 mm. long; leaves linear about 10 cm. long and 5 mm. broad, not developed at flowering time or only towards the base of the rhachis, upper ones reduced to sheaths [19. andongense](#)
- 21** Pedicels jointed below the middle; inflorescences slender, about 10 cm. long; fruits suborbicular, 5 mm. diam. (for other characters see above) [16. laxum](#)
 Pedicels jointed in the middle: **22**
- 22** Leaves linear, about 1 cm. broad; inflorescence a slender panicle up to 30 cm. high; perianth segments linear, 5 mm. long, bracts subulate from a broader base, 3 mm. long [20. bequaertii](#)
 Leaves lanceolate, 2-3 cm. broad; inflorescence an interrupted raceme up to 30 cm. high; perianth segments lanceolate, 4 mm. long; bracts ovate-lanceolate, about 1 cm. long [21. deistelianum](#)

1. Chlorophytum senegalense (Bak.) Hepper in Kew Bull. 21: 496 (1968). *APD acc*

Dasystachys sanegalensis Bak. in Bull. Herb. Boiss., sér. 2, 1: 782(1901); F.W.T.A., ed. 1, 2: 345.

D. macensis A. Chev., Bot. 652 (1920), name only.

Stout, unbranched inflorescence 3-4 ft. high arising from a thick tuber or rhizome; flowers white; [in savanna](#).

Sen.: Kaolak (July) Berhaut 2157! Tambacounda to Samballo (fr. Oct.) Pitot 6! **Mali:** Thou to Kirl, S. Macina (Aug.) Chev. 24854! Chlorophytum guineense *A. Chev.*, Bot. 650 (1920), name only; F.W.T.A., ed. 1, 2: 345 (1936), English descr. only; v. Poelln. in Portug. Acta Biol. sér. B, 1: 223 (1945), German descr. only.

Guin.: Grandes Chutes (fr. Dec.) Chev. 20218! Teliko Pobéguin 1120! **S. L.:** Wallia, Scarcies (Feb.) Sc. Elliot 4584!

Also in **E. Cameroun**, **C. African Rep.** and **Angola**.

20. Chlorophytum bequaertii *De Wild.* Pl. Bequaert. 1: 14 (1921).

APD: Synonym of Chlorophytum gallabatense var. micranthum

Chlorophytum inundatum A. Chev., Bot. 651 (1920), name only; F.W.T.A., ed. 1, 2: 345 (1936), English descr. only; Morton, W. Afr. Lilies & Orch. fig. 17.

Herb with narrow leaves and panicle about 1 ft. high; flowers greenish brown with white filaments and style; [on rock outcrops in savanna](#).

Mali: Macina (July) Roberty 2546! **Guin.:** Irébéléya to Timbo, Fouta Djallon (Sept.) Chev. 18328! **S. L.:** Koya Mt., near Bafodia (Aug.) Haswell 11! 60! **Ghana:** fide Morton l.c.

Also in **C. African Rep., Congo** and **Rwanda**.

21. Chlorophytum deistelianum Engl. & K. Krause in Engl., Bot. Jahrb. 45: 134 (1910).

APD: Synonym of Chlorophytum sparsiflorum Baker var. sparsiflorum

Chlorophytum stenopetalum of Chev. Bot. 652, not of Bak.

Leaves thin with undulating margins; inflorescence about 1 ft. high, longer than the leaves.

W. Cam.: Buea Deistel 649!

[I am not certain about the status of this species; it is close to C. sparsiflorum-F.N.H.]

7. URGINEA

Steinh. in Ann. Sci. Nat. Paris, sér 2, 1: 321 (1834); F.T.A. 8: 536.

APD: Synonym of Drimia Jacq. ex Willd.

- 1** Pedicels about 3-5 cm. long, slender, not jointed, arching in flower, erect in fruit; inflorescences few-flowered, 30-70 cm. high; perianth segments 9-15 mm. long, shortly connate at the base; capsule ovate, 2 cm. long, erect; bracts linear, early-caducous; leaves linear, 6(-20) cm. broad [see note after sp.], developing after flowering [1. indica](#)

Pedicels less than 2 cm. long: **2**

- 2** Pedicels 1-2 cm. long; inflorescences stout, very many-flowered, up to 2 m. high, perianth segments about 6 mm. long; capsule depressed globose in outline, deeply 3-lobed, about 1 cm. broad; bracts small and linear, early caducous; leaves broadly linear, about 3 cm. broad, developing after flowering [2. altissima](#)

Pedicels of flower less than 1 cm. long (about 1 cm. in fruit); bracts more or less persistent: **3**

- 3** Inflorescence about 60 cm. long with rather numerous small flowers in the upper third; perianth segments about 6 mm. long, 3-nerved with broad hyaline margins; capsule deeply 3-lobed, 1 cm. long and broad, transversely veined, truncate at the base; leaves linear, about 1-5 cm. broad, developing during flowering [3. ensifolia](#)

Inflorescence up to 10 cm. long, few-flowered, densely clustered near apex; perianth segments 6 mm. long, with a broad dark median nerve and hyaline margins; leafless at flowering time; leaves and fruit unknown [4. pauciflora](#)

- 1. Urginea indica (Roxb.) Kunth** Enum. Pl. 4: 333 (1843); F.T.A. 7: 540; Chev. Bot. 655; Berhaut, Fl. Sén. 5, 181; Morton, W. Afr. Lilies & Orch. fig. 1.

APD: Synonym of Drimia indica (Roxb.) Jessop

Scilla indica Roxb. (1831).

Inflorescence 1-4 ft. high appearing before the leaves; flowers dull green; [in rocky savanna](#).

Maur.: M'Bout (Mar.) Roberty 16883! **Sen.:** Diourbel Chev. 4503! St. Louis Berhaut 878. **Mali:** Dialiba Chev. 258. Sareya Chev. 20625. San Chev. 1099. **Guin.:** Kindia Chev. 13541. Farana Chev. Conakry Airfield (May) Baldwin 5791! **S. L.:** Regent (Apr.) Hepper 2550! Karina (Feb.) Glanville 161! Duunia (Feb.) Sc. Elliot 4817! Wallia (Feb.) Sc. Elliot 4572! Musaia (fr. Apr.) Deighton 5371! **Ghana:** Afram Plains, Ashanti (Feb.) Cansdale 9! Damongo Scarp (Mar.) Morton GC 8683! Nangodi Morton A3165! **Togo Rep.:** Lomé Warnecke 94! **N. Nig.:** Nupe Barter 1099! Jebba (Feb.) Meikle 1172! 1182! Naraguta Hill 35! Abinsi (Apr.) Dalz. 855!

Widespread in tropical Africa and extending to India and tropical Asia.

[U. sebirei Berhaut (in Mém. Soc. Bot. Fr. 1953-54: 7 (1954), as sebirii Senegal Berhaut 461!) has been segregated from U. indica on account of its much broader leaves and peltate bracteoles. As the leaves usually develop after the inflorescence

and the bracteoles are caducous, it may not be easily distinguished. It is one of a number of forms exhibited by the widely distributed *U. indica* aggregate-F.M.H.]

2. *Urginea altissima* (Linn. f.) Bak. in J. Linn. Soc. 13: 221 (1872); Chev. Bot. 655; Berhaut. Fl. Sén. 5, 181; Morton, W. Afr. Lilies & Orch. t. 3.

APD: *Synonym of Drimia elata* Jacq.

APD: *Synonym of Drimia altissima* (L. f.) Ker Gawl.

Ornithogalum altissimum Linn. f., Suppl. 199 (1781).

O. giganteum Jacq., Hort. Schoen. t. 87 (1797).

Drimia altissima (Linn. f.) Ker-Gawl. in Bot. Mag. t. 1074 (1808).

D. barteri (1870)-F.T.A. 7: 526.

Urginea micrantha (A. Rich.) Solms-Laub. (1867)-Chev. Bot. 656.

Inflorescence 1 1/2-7 ft. high appearing without leaves during the dry season from a large bulb; flowers whitish; **very common in savanna.**

Sen.: Kaolak (Feb.) Berhaut 898! Bondou (Mar.) Heudelot 355! **Gam.:** N. Bank, Gambia R. (July) Ozanne 33! **Mali:** Bamako (Jan.) Chev. 236! Kati (Jan.) Chev. 192! [A variable species. Morton (l.c.) draws attention to at least three forms occurring in W. Africa: large, medium and small sized plants which usually grow in uniform populations.]

3. *Urginea ensifolia* (Thonning) Hepper in Kew Bull. 21: 497 (1968).

APD: *Synonym of Drimia glaucescens* (Engl. & K. Krause) H. Scholz

Ornithogalum ensifolium Thonning in Schum., Beskr. Guin Pl. 173 (1827).

Urginea glaucescens Engl. & K. Krause in Engl. Bot. Jahrb. 45: 146 (1910); Milne-Redhead in Kew Bull. 3: 470 (1949); Morton, W. Afr. Lilies & Orch. fig. 2.

Ornithogalum ndellense A. Chev. (1913), name only.

Alcuba narcissifolia of Chev. Bot. 654 (Dahomey), not of A. Chev. (1907) (Ubangi-Shari).

Urginea narcissifolia (A. Chev.) Hutch in F.W.T.A., ed. 1, 2: 348 (1936), partly.

Anthericum articulatum Hutch, in F.W.T.A., ed. 1, 2: 341 (1936), partly (Lely 127), English descr. only.

Inflorescence 1-2 ft. high, flowers white with a broad green median stripe on each tepal, leaves commencing growth at flowering time; **in seasonally wet savanna and amongst rocks.**

Ghana: Coastal areas Thonning! Achimota Irvine 1005! Labadi (Apr.) Irvine 2651! Volta R. Anderson 18! **N. Nig.:** Jira (May) Lely 127! Anara F.R., Zaria (May) Keay FHI 22930! Katagum Dalz. 236! Yola, (July) Dalz. 234! Abinsi (Apr.) Dalz. 856!

Also in **E. Cameroun** and **C. African Republic**.

4. *Urginea pauciflora* Bak. in F.T.A. 7: 539 (1898); Chev. Bot. 656.

APD: *Synonym of Ebertia pauciflora* (Baker) Speta

APD: *Synonym of Drimia calcarata* (Baker) Stedje

A small plant with a small cluster of flowers perianth dark-coloured; bulb scales also dark.

Guin.: Jac.-Fél! Labé, 3,100 ft. (Apr.) Chev. 12304! **S. L.:** Wallia, Scarcies (Feb.) Sc. Elliot 4580!

Linn., Sp. Pl. 308 (1753); F.T.A. 8: 542. *APD acc*

- 1 Flowers bright yellow, 2-5 cm. long, perianth segments free to the base, with broad thin margins; bracts persistent, tailed acuminate from an ovate-lanceolate base, 2.5-4.5 cm. long, many-nerved; pedicels about 7 mm. long, persistent and jointed at the top; capsule ovoid, 2 cm. long, transversely nerved; seeds black, angular, 6 mm. long; leaves developing after flowering, 1-2 cm. broad [1. abyssinica](#)
Flowers yellowish green, 1-2 cm. long:.....2
- 2 Perianth 1.5-2 cm. long; pedicels about 5 mm. long, elongating considerably in fruit; fruit broadly ovoid, 1.5-2 cm. long; bracts variable in length, 1-2.5 cm. long; leaves glabrous, developing during or after flowering2.
[nigritana](#)
Perianth 1 cm. long; pedicels about 4 mm. long, not markedly elongating in fruit; fruit ovoid, about 1 cm. long; bracts usually less than 1 cm. long; leaves sometimes ciliate on the margin, developing during or after flowering3. [sudanica](#)

1. *Albuca abyssinica* Murray Syst. Veg. ed. 14, 326 (1784); Hepper in Kew Bull. 21: 493 (1968); F.T.A. 7: 533. *APD acc*

APD: *Synonym of Albuca abyssinica* Jacq.

Herb with a bulb 1-2 in. diam.; inflorescence up to 7 ft. high with large pendulous pale yellow flowers; wet places in hilly savanna.

N. Nig.: Jos (Aug.) Keay FHI 12705! Naraguta F.R. (July) Lawlor & Hall FHI 45573! Hepham to Ropp, 4,600 ft. (July) Lely 380! Mada Hills (Aug.) Hepburn 77! Fobur, Korom, Jarawa Dist. (July) Summerhayes 18! **S. Nig.:** Mt. Orosun, Idanre Hills (Oct.) Keay FHI 22590!

Extending to **Ethiopia** and **Arabia**.

2. *Albuca nigritana* (Bak.) Troupin in Bull. Jard. Bot. Brux. 25: 231 (1955), and in Expl. Parc Nat. Garamba 4: 181; Morton, W. Afr. Lilies & Orch. fig. 4. *APD acc*

Urginea nigritana Bak. (1873)-F.T.A. 7: 542; F.W.T.A., ed. 1, 2: 348; Berhaut, Fl. S  n. 181.

Albuca schweinfurthii Engl. (1892)-F.T.A. 7: 533.

Albuca ledermannii Engl. & K. Krause (1910).

Albuca sudanica A. Chev. (1908), partly.

Single inflorescence about 2 1/2 ft. high arising from the leafless bulb (or with young leaves) during the dry season; perianth segments with a median green stripe and pale green or whitish margins; in savanna.

Sen.: Cape Verde (Mar.) Adam 871! Camb  r  ne (July) Berhaut 2155! **Mali:** Kita to Bamako (Jan.) Chev. 161! Dio (Jan.) Chev. 172! **Guin.:** Mamou to Conakry (fr. May) Pitot! **S. Probably extending well to the east in savanna country.

9. DRIMIOPSIS

Lindl. in Paxt., Fl. Gard. 2: 73, fig. 172 (1851); F.T.A. 7: 542. *APD acc*

- 1 Leaves ascending, linear-lanceolate, up to 20 cm. long and 2 cm. broad, with spaced parallel nerves, margins subhyaline; inflorescence long-pedunculate, spicate, the flowers subsessile on the axis; perianth campanulate, about 3.5 mm. long; seeds black [barteri](#)

Drimiopsis barteri *Bak.* in Saunders, Ref. Bot. 3, App. 18 (1870); F.T.A. 7: 543; Chev. Bot. 656; Troupin in Expl. Parc Nat. Garamba 4: 195; Morton, W. Afr. Lilies & Orch. fig. 6. *APD acc*

Drimiopsis aroidastrum *A. Chev.* in Mém. Soc. Bot. Fr. 2, 8: 93 (1908).

Drimia barteri (in error) of Chev. Bot. 653, not of Bak.

Bulb about 2 in. long, giving rise to flowers and leaves at the same time; leaves sometimes purple beneath and spotted above; flowers greenish, apparently occasionally cleistogamous with the perianth remaining closed.

Ghana: Yendi (Apr.) Morton GC 9094! **N. Nig.:** Lokoja (Apr.) Parsons L114! Nupe Barter 1512! 3449! Sokoto (June) Dalz. 541! Anara F.R., Zaria Prov. (May) Keay FHI 22924! 25770! Ancho (May) Hepburn 144! Mada Hills Hepburn 79! Yola (Apr.) Dalz. 236!

Also in **E. Cameroun** and **C. African Rep.**

10. SCILLA

Linn., Sp. Pl. ed. 2: 438 (1762); F.T.A. 7: 548.

- 1 Small bulbous herb; raceme occurring together with the leaves and usually rather longer than them; flowers in the upper 1/4 of the peduncle; pedicels 2-4 mm. long; perianth 4 mm. long; leaves about 8 cm. long or up to 15 cm. long, 6-12 mm. broad, closely nerved [sudanica](#)

Scilla sudanica *A. Chev.* in Mém. Soc. Bot. Fr. 2, 8: 94 (1908); Hepper in Kew Bull. 21: 497 (1968).

APD: *Synonym of Ledebouria sudanica* (*A. Chev.*) *J. W. van der Burg*

Scilla picta *A. Chev. ex Hutch.* in Kew Bull. 1939; 244; Chev. Bot. 657, name only; F.W.T.A. ed. 1, 2: 350; Morton, W. Afr. Lilies & Orch. fig. 7.

Scilla camerooniana of F.W.T.A., ed. 1, 2: 350, partly (Chev. 23719) not of Bak.

Scilla dahomensis *A. Chev.*, Bot. 657, name only.

Scilla mankonensis *A. Chev.*, name only.

Leaves often mottled, sometimes almost flat on the ground; inflorescence a few inches to nearly a foot high with inconspicuous greenish flowers tinged dull purple; [amongst rocks in savanna](#).

Sen.: Birkelane (fl. & fr. Aug.) Berhaut 286! Dalafing Koussan Trochain 3571! **Gam.:** (Mar.) Brooks 60! Niana Bantang (July) Rhind in Hb. Deighton 5585! **Guin.:** Timbo (May) Pobéguin 1585! Farana (May) Chev. 13413! Kankan to Kouroussa Brossart in Hb. Chev. 15719! **Iv. C.:** Nandala to Mankono (June) Chev. 21871 bis! Siana to Nandala (June) Chev. 21855! [Chev. 23719 recorded as *S. camerooniana* in Ed. 1 seems to be only a luxuriant form of *S. sudanica*. The latter name has priority over *S. picta*. but when the genus is revised for tropical Africa as a whole, a still earlier name may be applicable-F.N.H.]

***Scilla camerooniana* Bak.** in Saund., Ref. Bot. 3, App. 9 (1870); F.T.A. 7: 554; F.W.T.A. ed. 1, 2: 350.

Although this species was included in Ed. 1, Mann 728, 2230 were collected outside the area of this Flora.

Excluded species

***Scilla bertholetii* Webb** Phyt. Canar. 3: 337, t. 232 (1847); Hook in Bot. Mag. t. 5308; F.T.A. 7: 550.

APD: *Synonym of Autonoë berthelotii (Webb) Speta*

This species was included in F.W.T.A. ed. 1 on the basis of a bulb collected by Mann near Cameroons R., E. Cameroun, and grown at Kew. However, in F.T.A. it was attributed to Barter and so is the specimen in Kew Herbarium. It is unlikely to be the Canary I. species and it seems to be *S. camerooniana* Bak.

11. DIPCADI

Medic. in Act. Palat., Mannheim 6: 431 (1787); F.T.A. 7: 516.

- 1 Inflorescence very slender, few-flowered (10-)20-30 cm. long; leaves up to about 5 mm. broad, linear, usually appearing after the inflorescence; bulb 1-2 cm. diam.; bracts only a little longer than the pedicels; outer perianth segments conspicuously tailed [1. *tacazzeanum*](#)
- Inflorescence many-flowered, 30-100 cm. long; leaves 8-15 mm. long, linear, usually appearing with the inflorescence; bulb up to 4 cm. diam.; bracts much longer than the pedicels; outer perianth segments conspicuously tailed, reflexed during anthesis [2. *longifolium*](#)

1. ***Dipcadi tacazzeanum* (Hochst. ex A. Rich.) Bak.** in J. Linn. Soc. 11: 400 (1870); F.T.A. 7: 520.

APD: *Synonym of Ornithogalum viride (L.) J.C. Manning & Goldblatt*

***Uropetalum tacazzeanum* Hochst. ex A. Rich.**, Tent. Fl. Abyss. 2: 325 (1851).

***Dipcadi occidentale* Bak.** (1895)-F.T.A. 7: 521; F.W.T.A., ed. 1, 2: 350; Aké Assi, Contrib. 2: 19 [228]

***Dipcadi dahomensis* A. Chev.**, Bot. 653, name only.

***Dipcadi gourmaensis* A. Chev. ex Hutch.** in F.W.T.A., ed. 1, 2: 350 (1936), English descr. only.

A slender bulbous plant with small narrow leaves, often leafless at time of flowering; flowers yellowish or purplish-green honey-scented.

Mali: Gao (Aug.) de Wailly 5110! **Guin.:** Kolenté (June) Chillou 1589! **S. L.:** Hastings to Lumley Deighton 2683! Brookfields (May) Deighton 5522! 5523! Wallia, Scarcies (Feb.) Sc. Elliot 4840! Loma Mts. (fl. Jan., fr. Mar.) Jaeger 8794! 9434! **Iv. C.:** Kong Mangenot & Aké Assi IA 4283. **U. Volta:** Diapaga to Fada Chev. 24422! 24502! **Ghana:** Adamsu (fr. Apr.) Morton A3879! Apparently widely distributed in the drier parts of tropical Africa.

[See note after next sp.]

2. ***Dipcadi longifolium* (Lindl.) Bak.** l.c. 397 (1870); F.T.A. 7: 519. **APD acc**

APD: *Synonym of Ornithogalum viride (L.) J.C. Manning & Goldblatt*

***Uropetalum longifolium* Lindl.** in Bot. Reg. t. 974 (1826).

***Dipcadi kerstingii* Dammer** (1905).

Dipcadi tacazzaenum of Morton, W. Afr. Lilies & Orch. fig. 5, not of (Hochst ex A. Rich.) Bak.

A bulbous herb with twisted leaves; inflorescence up to 2 ft. high; flowers green; **in savanna.**

Port. G.: Unknown Coll. 1187! **Iv. C.:** Kouroukourounga (fl. & fr. Apr.) Aké Assi 8743! **Ghana:** Ejura (fl. & fr. Mar.) Hepper & Morton A3203! Yendi to Bawku (fr. Apr.) Morton A3905! Gambaga (May) Morton A3339! **N. Nig.:** Shuifuri (May) Thornehill 187! Ilorin Barter 3441! Yola (Apr.) Dalz. 232! Apparently widespread in tropical Africa.

[The division of our specimens into two species on the characters used in the key is arbitrary. It is apparent that the size of the plants in a population can depend on their age and nourishment, but no morphological characters appear to be reliable. A critical study of living material is essential for an appreciation of the range of variation exhibited by *Drimia* before a satisfactory taxonomic revision can be attempted-F.N.H.]

12. DRIMIA

Jacq., *l.c.* Rar. t. 373-377 (1788); F.T.A. 7: 525.

- 1 Racemes slender, about 40 cm. long, flowering in the upper third, not accompanied by leaves; pedicels 3 mm. long; bracts linear-filiform, early caducous; perianth about 1 cm. long, segments connate in the lower half, linear, reflexed and curled; stamens long-exserted; fruit 3-lobed, orbicular in outline, nearly 1 cm. diam., glabrous; leaves linear, acute, pilose-ciliate, imperfectly known and appearing after the inflorescences [*zombensis*](#)

***Drimia zombensis* Bak.** in F.T.A. 525 (1898); Hepper in Bull. I.F.A.N 28: 123 (1966).

APD: *Synonym of Drimia elata Jacq.*

***Drimia incerta* A. Chev. ex Hutch.** in Kew Bull. 1939: 245; Chev. Bot. 653, name only; F.W.T.A., ed. 1, 2: 351 (1936), English descr. only.

Inflorescence about 1 ft. high or more arising from a bulb 3 in. long and 2 in. thick with purplish scales inside and out and a long neck of purple leaf bases; flowers brownish green; leaves appearing separately; [in rocky upland savanna](#).

Guin.: Zangama, Dalaba (fr. Apr.) Chillou 1235! **S. L.:** Loma Mts. (Feb.) Jaeger 9369! Morton & Gledhil SL 1057! **Iv. C.:** Gouékouma and Koualé, Toura country, Haute-Sassandra (May) Chev. 21656bis. 21733 **N. Nig.:** Ancho (Apr.) Hepburn 139! Mambila, Plateau (Jan) Hepper 1802! Wimbush FHI 48400! **W. Cam.:** Bafut-Ngembu F.R. (Feb.) Hepper 2114! Daramola FHI 40529!

Also in [Uganda](#), [Kenya](#), [Zambia](#), [Malawi Rhodesia](#), [Angola](#) and [Mozambique](#).

13. GLORIOSA

Linn., *Sp. Pl.* 305 (1753); F.T.A. 7: 563.

- 1 Perianth-segments with very crisped-wavy margins for the whole length, narrowly linear, 6-9 cm. long, about 1 cm. broad; leaves sessile, in whorls of 3 or opposite or alternate, the lamina ovate-lanceolate, about 8-10 cm. long and 4 cm. broad, ending in a long slender cirrhose apex; style longer than the perianth, acutely reflexed; filaments shorter than the perianth; anthers about 1 cm. long; fruits about 9 cm. long and 2 cm. broad; climber in forest [*L. superba*](#)

Perianth-segments only slightly undulate towards the apex or with flat margins, broadly oblanceolate and about 4 cm. long or narrowly linear and about 9 cm. long; lower leaves sometimes hardly tendriform; erect or climbing in savanna country [*L. simplex*](#)

1. ***Gloriosa superba* Linn.** l.c. (1753); F.T.A. 7: 563. Bot. Reg. t. 77; Andr., Bot. Rep. t. 129; Berhaut, Fl. Sén. 148; Morton, W. Afr. Lilies & Orch. fig. 12. *APD acc*

Common [forest climber](#); flowers turning from yellow to red.

Widely distributed in tropical Africa to northern Transvaal and in tropical Asia.

2. ***Gloriosa simplex* Linn.** Mant. 62 (1767).

APD: *Synonym of Gloriosa superba L. var. superba*

***Gloriosa caerulea* Mill.** (1768).

***Gloriosa virescens* Lindl.** in Bot. Mag. t. 2539 (1825); F.T.A. 7: 563.

***Gloriosa virescens* var. *grandiflora* (Hook.) Bak.** (1879)-Bot. Mag. t. 5216.

Mainly in savanna, erect or climbing; typically with smaller flower than the last species, although large flowered plants do occur.

Widespread in tropical Africa.

[Owing to great variation the taxonomy of *Gloriosa* remains confused and specimens have not been cited here. Brunt 424 resembles highland specimens from E. Africa known as *G. abyssinica* A. Rich., if this is maintainable as a species distinct from *G. simplex* Linn.-F.N.H.]

14. IPHIGENIA

Kunth, Enum. Pl. 4: 212 (1843); F.T.A. 7: 561.

- 1 Stems very flexuous, bearing 4-5 narrowly linear acute leaves about 10 cm. long with about 4 parallel nerves on each side of the midrib; flowers solitary; pedicels about 2 cm. long, at length elongating; perianth-segments free to the base, linear, 5-7 mm. long; fruit 1-2 cm. long, laterally lobed, slightly rugose [ledermannii](#)

***Iphigenia ledermannii* Engl. & K. Krause** in Engl., Bot. Jahrb. 45: 123 (1910); Morton, W. Afr. Lilies & Orch. fig 9; Aké Assi, Contrib. 2: 19 [228]; Hepper in Kew Bull. 21: 497 (1968).

APD: *Synonym of Iphigenia pauciflora Martelli*

***Helonias guineensis* Thonn.** in Schum., Beskr. Guin. Pl. 182 (1827), not *Iphigenia guineensis* Bak. (1898).

***Iphigenia sudanica* A. Chev.**, Bot. 658, name only.

Rootstock a small corm with brown coverings; flowering stem 5-15 in. high, flowers deep crimson inside with the 6 thread-like segments spreading in the form of a star; in moist places in savanna.

iv. C.: Ouango-Fitini (fr. July) Aké Assi IA 5659! **U. Volta:** Mossi (Aug.) Chev. 24675! Fada, Gourma (July) Chev. 24490! Konkobiri to Diapaga, Gourma Chev. 24355. **Ghana:** Tema (June) Hall 2599! Also in **E. Cameroun**.

15. WURMBEA

Thunb., Nov. Gen. 18 (1781); F.T.A. 7: 560.

- 1 Leaves 1 or 2 arising from the bulb, linear, acute, 6-16 cm. long, 1-5-4 mm. broad, glabrous; corm ovoid about 1 cm. long, covered with brown tunics appearing bulb-like; membranous sheath around the base of the stem truncate, 1-3 cm. long; stem leaves 2-3 decreasing in size upwards; spike 2-6-flowered; perianth segments shortly connate at the base, narrowly oblanceolate, 6 mm. long; anthers broadly ovate-elliptic, cordate at the base [tenuis](#)

***Wurmbea tenuis* (Hook. f.) Bak.** in J. Linn. Soc. 17: 436 (1879); F.T.A. 7: 560. *APD acc*

***Melanthium tenue* Hook. f.** in J. Linn. Soc. 7: 223 (1864).

Tiny tunicated corm giving rise to flowering stem 3-8 in. high; perianth white and purple, fading in older flowers; amongst rocks in montane grassland.

W. Cam.: Cam. Mt.? Preuss 933! Bafut-Ngemba F.R. (Mar., Apr.) Richards 5322! Ujor FHI 30007! Lakom (fl. & fr. Apr.) Maitland 1407! 1511! **F. Po:** 9,000 ft. (May) Mann 1454!

TECOPHILAEACEAE

Herbs with fibrous tunicated corms or thick orbicular flattened tubers. Leaves radical or towards the base of the flowering stems, linear to ovate-orbicular and cordate, glabrous. Flowers bisexual, actinomorphic, in simple racemes separately from the tuber or corm, or in panicles; bracts large and membranous to small. Perianth-tube short or absent; lobes 6, spreading or reflexed, subequal, imbricate

Stamens 6, perfect, or 3 and with 3 staminodes, inserted at the throat of the perianth; anthers 2-locular, the connective often produced at both ends, the base then swollen or spur-like, cells opening by a terminal pore, rarely by a slit. Ovary semi-inferior, 3-locular; style subulate or filiform. Ovules numerous, axile, 2-seriate in each loculus. Fruit a loculicidal capsule. Seeds numerous, with fleshy endosperm.

Mainly Southern Hemisphere, especially S. Africa and Chile.

CYANASTRUM

Oliv. in Hook., *Ic. Pl.* 20: t. 1965 (1891); S. Carter in Kew Bull. 16: 190 (1962).

- 1 Corms solid, depressed-globose, arranged in tiers, with few roots; leaves single from the corm, long-petiolate, very broadly ovate or ovate-orbicular; widely cordate at the base, acutely triangular at the apex, about 15 cm. long and up to 15 cm. broad, with numerous arcuate nerves radiating from the base and faint transverse parallel nerves; petiole up to 30 cm. long; flowering stems short, leafless, arising directly from the corm, clothed with a few membranous oblanceolate sheathing bracts; perianth with 6 equal spreading coralline obovate lobes; stamens 6, opposite the lobes; anthers linear, opening by terminal pores; ovary half inferior; fruit deeply 3-lobed [cordifolium](#)

Cyanastrum cordifolium *Oliv.* l.c. (1891); Engl. in Engl. & Prantl, *Pflanzenfam.* ed. 2, 15a: 189, fig. 72 J-M; S. Carter l.c. 192, fig. 1, 4-9. *APD acc*

Schoenlandia gabonensis *Cornu* (1896).

Herb of the [rain-forest floor](#), often gregarious; flowers bright blue.

S. Nig.: Oru to Ibadan (May) Millson 89! Ibadan South F.R. (July) Ahmed & Chizea FHI 20009! Okomu F.R., Benin Brenan 8462! Sapoba Kennedy 206! 2713! Oban Talbot 911! **W. Cam.:** Eyo, Mamfe Dist. Extends to Gabon.

PONTEDERIACEAE

Aquatic erect or floating herbs. Leaves with floating or immersed blades sheathing at the base. Flowers bisexual, actinomorphic, arranged in racemes or panicles subtended by a spathe-like leaf-sheath; bracts minute or absent. Perianth hypogynous, corolline; lobes 6 or 4, sub-biseriate. Stamens 6 or 3, rarely 1, inserted on the perianth, sometimes somewhat unequal in length or 1 the longest of all; filaments free; anthers 2-locular, opening lengthwise by slits or rarely by pores. Ovary superior, 3-locular, with axile placentas or 1-locular with 3 parietal placentas; style entire or shortly lobed. Ovules numerous to solitary and then pendulous. Fruit a capsule opening by 3 valves, or indehiscent. Seeds ribbed, with copious endosperm.

Fresh water aquatics, in the tropics and subtropics.

- 1 Stamens 6 in the normal flowers: [2](#)
Stamens 3 in the normal flowers, sometimes 1 in the cleistogamous flowers; leaves all alike [3. Heteranthera](#)
- 2 Perianth-segments free to the base; leaves all alike [1. Monochoria](#)
Perianth-segments partially united into a tube; submerged leaves linear, floating ones ovate or ovate-orbicular [2. Eichhornia](#)

Scholleropsis lutea *H. Perr.* *APD acc*

With 4 perianth-segments has been found once in E. Cameroun: it is otherwise only known from Madagascar. Letouzey in Adansonia, sér. 2, 7: 33 (1967).

Pontederia lanceolata *Nutt.*

Native in N. America, is cultivated at Victoria, W. Cameroun.

1. MONOCHORIA

C. Presl, Rel. Haenk. 1: 127 (1827); F.T.A. 8: 5; Verdcourt in Kirkia 1: 80-83 (1961).

- 1 Basal leaves reduced to membranous sheaths; leaves narrowly lanceolate, acutely acuminate, about 6 cm. long and 1 cm. broad, narrowed into a false petiole about as long as the blade and expanded into a membranous sheath at the base; racemes at first embraced by the leaf-sheath, soon exserted, about 8-12-flowered; pedicels stout, 4mm. long; perianth-segments oblong, about 1 cm. long, 6-7 nerved, with membranous margins; anthers subequal, but one larger, 4-5 mm. long; fruit enclosed by the persistent perianth *brevipetiolata*

Monochoria brevipetiolata *Verdc.* l.c., t. 9, 10 (1961). *APD acc*

Monochoria vaginalis var. **plantaginea** of F.W.T.A., ed. 1, 2: 354; of Sousa in Anais Junta Inv. Col. 5: 55 (1950), not of Solms-Laub.
Monochoria africana of Berhaut, Fl. Sén. 185, not of (Solms-Laub.) N. E. Br.

An aquatic herb nearly a foot high with blue or violet flowers; in pools on laterite rocks.

Sen.: Tambacounda Berhaut 1268; 3136. Galam Heudelot 241! **Gam.:** Fulladu West (Nov.) Frith 153! Bansang Duke 14!

Extends in savanna to **Sudan**, **Uganda**, Congo, Zambia, Rhodesia, **Angola** and. S.W. Africa; also in **Cuba** and **tropical S. America**.

E. crassipes (Mart.) Solms-Laub., the water hyacinth, is a tropical American floating aquatic with inflated petioles which is now widespread in the Old World Tropics. It is sometimes cultivated in pools as an ornamental and it has become a serious pest as a water weed in parts of tropical Africa, as yet outside our area (see Wild in Kirkia 2: 9, with fig. (1961)).

3. HETERANTHERA

Ruiz & Pav., Prod. 9, t. 2 (1794); F.T.A. 8: 2 Nom. cons.

- 1 Aquatic herb; leaves petiolate, ovate to lanceolate, cordate to rounded at the base, 5-7 cm. long, 1-5 cm. broad,

thin, glabrous, with numerous slender nerves ascending from the base; petiole sheathing at the base and embracing the capsule; flowers spicate, few; perianth-tube about 5 mm. long, lobes 6, oblong, about 4 mm. long, nervose; stamens 3 or reduced to 1 in the cleistogamous flowers [callifolia](#)

Throughout tropical Africa and into the Transvaal and SW. Africa.

SMILACACEAE

Shrubs, climbing or straggling, often with tendril-like petioles and prickly stems and branches; roots from an often stout rhizome; stems leafy. Leaves alternate or opposite, 3-nerved, reticulate-veiny between the nerves. Flowers dioecious or rarely bisexual, small, arranged in axillary umbels, racemes or spikes. Perianth-segments 6, free or rarely united. Stamens 6; filaments free or united; anthers apparently 1-locular by the confluence of the cells, introrse. Ovary superior, 3-locular; ovules 1-2 in each loculus, pendulous. Staminodes present in the female flower. Fruit a berry. Seeds 1-3; embryo small in hard endosperm.

Widely distributed.

A small family close to Liliaceae.

SMILAX

Linn., Sp. Pl. 1028 (1753); F.T.A. 7: 423.

Flowers dioecious, in umbels or panicles; perianth-segments free; stamens 6 or more, free.

- 1 A climbing shrub with prickly shoots; leaves alternate, ovate-elliptic to broadly elliptic, abruptly and very shortly acuminate (acumen oblique in dried specimens), rounded to subacute at the base, averaging about 12 cm. long and 7 cm. broad, glabrous, prominently 3-nerved from the base, larger leaves widely subcordate; flowers dioecious; umbels axillary, shortly pedunculate, many-flowered; peduncle bracteate at the base; pedicels slender, about 6 mm. long; perianth 5 mm. long; fruit subglobose, nearly 1 cm. diam. [Kraussiana](#)

Widespread in tropical Africa and in S. Africa.

ARACEAE

Herbs with watery, bitter or milky juice, with a tuberous or elongated rhizome, rarely woody and climbing. Leaves solitary or few, sometimes appearing after the flowers, mostly radical, when cauline then alternate and distichous or spirally arranged, entire or variously divided, often hastate or sagittate, with a membranous sheath at the base. Flowers small, arranged on a spadix enclosed in a spathe, bisexual or monoecious, the males in the upper part, females below, rarely dioecious. Perianth present in the bisexual flowers or absent from the unisexual flowers. Stamens hypogynous, 2-4-8, opposite the perianth-segments; anthers opening by pores or slits, free or united. Ovary superior or immersed, 1-many-locular; style various or absent. Ovules parietal, axile, basal or apical. Fruit a berry, or coriaceous and rupturing, 1-many-seeded. Seeds mostly with copious endosperm.

Usually easily recognised by the characteristic spathe enclosing the inflorescence (spadix).

Temperate and tropical regions, particularly tropical America, and tropical Asia.

- 1 Floating aquatic herb, with a tuft of fibrous roots and a rosette of flabellately nerved leaves; flowers unisexual, without a perianth, the female part of the spadix adnate to the spathe [1. Pistia](#)
- Terrestrial or epiphytic herbs or climbers, if aquatic not floating; female flowers more than one: **2**
- 2 Flowers hermaphrodite: **3**
- Flowers unisexual: **4**
- 3 Herb with large radical sagittate leaves; petiole prickly [2. Cyrtosperma](#)
- Climber with cauline leaves cunate at the base; petiole smooth [3. Rhaphidophora](#)
- 4 Perianth present; male flowers covering the upper part of the spadix; savanna or forest herbs [4. Stylochiton](#)
- Perianth absent: **5**
- 5 Herbs without distinct aerial stems, at most rhizomatous: **6**
- Herbs with well developed aerial stems, climbing or creeping, rooting at the nodes, or erect; spadix with an appendage: **16**
- 6 Spadix with a terminal appendage destitute of flowers; rootstock tuberous: **7**
- Spadix without a terminal sterile appendage: **9**
- 7 Leaves divided; leaves and flowers produced at different times: **8**
- Leaves peltate; leaves and flowers produced at the same time; introduced and cultivated, more or less naturalized [7. Colocasia](#)
- 8 Leaves pedate with a few segments; spadix with sterile process above the female portion [5. Sauromatum](#)
- Leaves 3-branched at the apex of the petiole, branches dichotomously divided, the ultimate segments each with one apex; spadix without sterile process [6. Amorphophallus](#)
- 9 Leaves not peltate: **10**
- Leaves peltate, cordate at the base: **15**
- 10 Leaves sagittate, elliptic etc. not divided (3-lobed, but not to the base, in *Nephtytis constricta*): **11**
- Leaves much divided, the upper ultimate segments each with 2 apices [13. Anchomanes](#)
- 11 Introduced, cultivated and more or less naturalized in waste places; leaves sagittate [8. Xanthosoma](#)
- Forest plants or herbs of wet places: **12**
- 12 Herbs of streams and wet places: **13**
- Herbs of drier places in forest; leaves sagittate or 3-lobed; ovules solitary in each cell [12. Nephtytis](#)
- 13 Spathe inconspicuous greenish colour; ovules numerous in each of the 2 or 3 cells; lateral nerves of leaves

- numerous and closely parallel, streams in lowland forest: **14**
- Spathe conspicuous golden-yellow; leaves hastate; ovules 2-3 in each of several cells; marsh herb in highland **11**.
Zantedeschia
- 14** Anthers inserted on the sides of the synandria; leaves cordate-sagittate, hastate, or linear-elliptic **9. Anubias**
Anthers crowded on top of the synandria; leaves hastate to 3-lobed **10. Amauriella**
- 15** Flowers and leaves produced in alternate seasons, the uniform-green leaves accompanied by a peduncle bearing burr-like bulbils covered with hooked prickles **14. Remusatia**
Flowers and leaves produced together, leaves usually brightly coloured; burr-like bulbils not produced; naturalized introduction **15. Caladium**
- 16** Ovary 2-3-celled with numerous ovules in each cell; anthers connate; herb of wet places (for other characters see above) **9. Anubias**
Ovary 1-2-celled with solitary ovule; anthers free; herbs of forest, often climbers: **17**
- 17** Leaves unequally pinnatisect or perforated **16. Rhektophyllum**
Leaves neither pinnatisect nor perforated: **18**
- 18** Seeds with endosperm; ovule basal; leaves more or less ovate, not hastate or 3-lobed **17. Culcasia**
Seeds without endosperm; ovule inserted above the base of the cell; leaves cordate, sagittate or hastate or 3-lobed **18. Cercestis**

Dieffenbachia sp.

From America is cultivated as an ornamental in Sierra Leone

Typhonium trilobatum (Linn.) Schott

This Asiatic species has been introduced into the vicinity of Bingerville, Ivory Coast.

Alocasia macrorrhiza Schott

The Asiatic elephant's ear, is occasionally cultivated in our area. Other genera are probably grown as ornamentals.

1. PISTIA

Linn., Sp. Pl. 963 (1753); F.T.A. 8: 140.

- 1** Leaves sessile in a rosette, oblong-spathulate, rounded, truncate or widely emarginate at the apex, up to about 12 cm. long and 5 cm. broad, with several subparallel flabellate nerves, softly puberulous to tomentellous on both surfaces, tomentose towards the base; spathe axillary, shortly pedunculate, up to 1.2 cm. long, tubular below, villous outside, ovate, with a broad white ciliolate margin; spadix shorter than the spathe, monoecious, the female part adnate to the spathe; male part a stipitate whorl of 3-8 flowers, each flower composed of 2 connate 2-celled anthers; ovary solitary, 1-celled, with a capitate stigma *stratiotes*

Pistia stratiotes *Linn.* l.c. (1753); F.T.A. 8: 140; Chev. Bot. 685; Berhaut, Fl. Sén. 184; Morton, W. Afr. Lilies & Orch. fig. 61; Wild in Kirkia 2: 13, t. 2. *APD acc*

A *floating herb*, propagates mainly by stolons and forming immense colonies; roots numerous, fibrous, reaching the bottom in shallow water; flowers obscure beneath the rosette of glandular viscid leaves. Water lettuce.

An aquatic widely distributed throughout the tropics.

2. CYRTOSPERMA

Griff., Notul. 3: 149 (1851), and Ic. 3: t. 169 (1851); F.T.A. 8: 197.

- 1 Leaves sagittate, variable in size, up to about 80 cm. long, and 40 cm. broad, the basal lobes lanceolate, acuminate, forming a narrow sinus, the terminal lobe ovate-lanceolate, acute, glabrous, laxly reticulate; petiole up to 2 m. long or more, prickly-toothed; spathe long-pedunculate (overtopping the leaves), enveloping and much longer than the spadix, 20-45 cm. long, acuminate; spadix sessile, cylindric; flowers hermaphrodite; berries 1.5 cm. long, oblong; seeds covered with dentate crests [senegalense](#)

Cyrtosperma senegalense (*Schott*) *Engl.* in DC., Monogr. Phan. 2: 270 (1879); F.T.A. 8: 198; Bot. Mag. t. 7617; Chev. Bot. 679; Berhaut, Fl. Sén. 180; Morton, W. Afr. Lilies & Orch. fig. 54.

APD: Synonym of Lasimorpha senegalensis Schott

Lasimorpha senegalensis *Schott*, Gen. Aroid. t. 85, fig. 1-10 and 1-20 (1858).

L. afzelii *Schott*, Gen. Aroid. t. 85, fig. 1-10 and 1-20 (1858).

Terrestrial herb with a rhizome giving rise to large sagittate leaves about 5 ft. high with prickly petioles; spathe green outside, inside cream with long dull red-purple linear marking presenting a longitudinally striped appearance; peduncle prickly, longer than the leaves and up to 12 ft. high; [at the margins of forest, and in swamps and ravines in savanna country.](#)

Widespread in drier savanna regions of tropical Africa.

3. **Stylochiton hostifolius** Engl. Bot. Jahrb. 36: 238 (1905).

APD: Synonym of Stylochaeton lancifolius Kotschy & Peyr.

Togo Rep.: Sokodé-Basari, near Alédyo (Feb.) Kersting 316!

[Further material is required for study to decide the status of this species: it is very close to *S. lancifolius* in the broad sense.]

4. **Stylochiton hypogaeus** Lepr. in Ann. Sci. Nat., Sér. 2, 2: 185, t. 5 (1834); F.T.A. 8: 192; Berhaut, Fl. Sén. 180. *APD acc*

Stylochiton similis N. E. Br. in F.T.A. 8: 194 (1901).

Stylochiton barteri N. B. Br. l.c. (1901); F.W.T.A., ed. 1, 2: 359; Chev. Bot. 684; Morton l.c. fig. 55.

Rhizome rather thick; flowers appearing before or sometimes with the leaves; spathe purplish; in flood plains.

Sen.: Dioubél Berhaut 5306! Districts of Cayor, Oualo and Cape Verde Leprieur! **Iv. C.:** Zagoué to Soucouraba Chev. 21570! Mankono Chev. 21894! **Ghana:** Navrongo (Apr.) Vigne FH 3757! 4530! Tamale to Damongo (Mar.) Adams 3914! **Dah.:** Dassa-Zoumé Chev. 23660! Djougou Chev. 23864! **N. Nig.:** Nupe Barter 1472! **S. Nig.:** Oyo Barter 3424!

Extending to C. African Republic.

A broad concept of the species has been adopted for this revision. Part of the difficulty is due to the presence of only leaves or flowers at the time of collection. Field workers should observe the range of variation within a population and obtain flowers and leaves from the same plant at different seasons.-F.N.H.

5. SAUROMATUM

Schott, Melet. 1: 17 (1832); F.T.A. 8: 141; Hepper in Kew Bull. 21: 492 (1968).

Jaimenostia Guinea & Gómez Moreno (1946).

- 1 Tuberous herb, tuber depressed globose with roots arising all round the top; leaf solitary, petiole stout smooth up to 1 m. long; lamina palmately and pedately lobed, segments broadly lanceolate, the largest lobe in the middle with the others decreasing in size outwards; inflorescence solitary; peduncle 5-15 cm. long, spathe elongate lanceolate up to 40 cm. long; spadix with basal female flowers about 5 cm. below male flowers, several sterile processes above the female portion, linear appendage up to 30cm. long [venosum](#)

Sauromatum venosum (Ait.) Kunth enum. Pl. 3: 28 (1841).

APD: *Synonym of Typhonium venosum (Dryand. ex Aiton) Hett. & P. C. Boyce*

Arum venosum Ait. (1789).

Sauromatum guttatum (Wall.) Schott (1832)-Engl., Pflanzenr. 4, 23 F: 123.

Sauromatum nubicum Schott (1856)-F.T.A. 8: 141; Engl. l.c. 126.

Jaimenostia fernandopoana Guinea & Gómez Moreno in Guinea, Ensayo Geobot. Guin. Continent. Españ. 248, figs. 39, 40 (1946), and in Ann. Jard. Bot. Madrid 6, 2: 466 (1946).

A geophyte with a, perennial tuber from which arises the short peduncle and purple-spotted spathe and later the single taller petiole with divided lamina 1-2 ft. across; fruits bright red; [in shady places in upland](#).

F. Po: Moka fide Guinea l.c.

Also in highland E. Cameroun and extending through much of the E. African mountains; also in India.

6. AMORPHOPHALLUS

Blume ex Decne., Herb. Timor 38 (1835); F.T.A. 8: 144; Engl., Pflanzenr. 4, 23C: 16 (1911). Nom. cons.

APD acc

- 1 Appendix of the spadix ovoid or ellipsoid, very short in comparison with its breadth, not more than 3 times as long as broad; leaves with narrow, more or less lanceolate segments: [2](#)
- Appendix of spadix cylindric or tapered to apex, long in proportion to the breadth, usually many times longer than broad, if only about 4 times as long as broad then about 6 mm. broad: [3](#)
- 2 Spathe open at the top, not much longer than the spadix, about 10 cm. long; appendix of spadix broadly ovoid, solid, 3-4(-5) cm. diam. at base; peduncle 11-20 cm. long [1. aphyllus](#)
- Spathe hooded at the top, much longer than the spadix, about 30 cm. long, appendix of spadix ellipsoid 5-9 cm. long, about 3 cm. broad; peduncle 4-40 cm. long [2. dracontioides](#)
- 3 Spathe forming a tube at the base, tube broadly campanulate, 4-5 cm. long; whole spathe up to 15 cm. long; spadix long-stipitate, much shorter than the spathe; flowering part 1.5 cm. long, appendix 3 cm. long; female flowers very few; leaves not known [3. elliotii](#)
- Spathe not forming a tube at the base: [4](#)
- 4 Spadix shorter than the spathe: [5](#)
- Spadix longer than the spathe: [6](#)
- 5 Leaf-segments shortly cuspidate-acuminate, obovate, decurrent on the rachis, 6-8 cm. long, 3-5-4 cm. broad, with about 6 pairs of looped lateral nerves; peduncle up to 30 cm. long; spathe ovate, folded at the base, 15-20

- cm. long, wrinkled inside towards the base but without hairs; spadix about 10 cm. long, appendix 4-5 cm. long [4. abyssinicus](#)
- Leaf-segments gradually long-tailed-acuminate, oblanceolate, shortly decurrent on the rhachis, 15-17 cm. long, 4-5 cm. broad, with numerous looped lateral nerves; peduncle up to 50 cm. long, slender; spathe 12 cm. long, spadix a little shorter [5. preussii](#)
- 6 Spathe lacking stiff hairs within the basal folded portion, light green (3.5-)5-15 cm. long, broadly elliptic; spadix half as long again to twice as long as the spathe, tapering to the top; ovary finely verrucose; leaf-segments oblong-oblanceolate, cuspidate-acuminate, decurrent on the rhachis, 10-12 cm. long, 3-4 cm. broad, with numerous parallel nerves looped within the margin (see notes after this species) [6. flavovirens](#)
- Spathe with numerous stiff hairs within the basal portion: **7**
- 7 Spadix not more than twice as long as the spathe: **8**
- Spadix several times as long as the spathe:
- 8 Spathe broadly ovate, narrowed to the apex, about 17 cm. long and 15 cm. broad when opened out; leaf-segments oblanceolate, tailed-acuminate, about 12 cm. long and 3 cm. broad, thin [7. johnsonii](#)
- Spathe ovate-orbicular, about 12 cm. diam. when spread out, not pointed; spadix slender, 18 cm. long; leaves not known [8. staudtii](#)
- Spathe suborbicular, about 25 cm. diam. when spread out, deeply crenate; leaf-segments broadly elliptic, broadly acuminate, the terminal about 25 cm. long and 10 cm. broad [9. manni](#)
- 9 Appendix of spadix narrowed near its base and with its broadest expanded part well above the male flowers, very long; spathe broadly ovate when spread out, 10-15 cm. long; male portion about 2 cm. long, 5-10 mm. diam. [10. calabaricus](#)
- Appendix of spadix with its broadest part immediately above the male portion and without any further constriction: **10**
- 10 Spathe at the base within, clothed with filiform processes [11. zenkeri](#)
- Spathe at the base within, densely covered with stout hairs or soft bristles [12. accrensis](#)

1. *Amorphophallus aphyllus* (Hook.) Hutch. F.W.T.A., ed. 1, 2: 362 (1936); Berhaut, Fl. Sén. 4, 11.
APD acc

Arum aphyllum Hook. in Gray, Travels in W. Afr. 386, t. A (1825).

Amorphophallus leonensis Lem. (1846)-F.T.A. 8: 147, incl. vars.; Engl. l.c. 105, fig. 36; Bot. Mag. t. 7768; Chev. Bot. 680.

Corynophallus afzelii Schott (1857).

Inflorescence 6-12 in. high from a tuber 2 in. across; spathe dark red-purple; leaves produced after the inflorescence.

APD: *Synonym of Amorphophallus johnsonii N.E. Br.*

Spathe yellow-green on outside, fringed bright purple inside, spadix brown.

Iv. C.: Dioandougou, Upper Sassandra Chev. 21515! **Ghana:** Accra Sander & Co.!

[Apparently close to *A. johnsonii* and if no taxonomic significance is placed on the length of the appendix, it may be conspecific-F.N.H.]

7. COLOCASIA

Schott in Schott and Endl., Melet. 1: 18 (1832); F.T.A. 8: 164; Engl., Pflanzenr. 4, 23E: 62 (1920).

- 1 A very stout rhizomatous herb; leaves peltate, more or less ovate, cordate at the base, basal lobes very obtuse, thin, glabrous; lateral nerves radiating from the base and pinnate, about 6-8 pairs; peduncle about 15 cm. long; spathe usually about 1.8 cm. long, narrow, acuminate, enfolding the spadix and articulating at the base of the male part in fruit; spadix much shorter than the spathe, tapered to the apex; berries enclosed in the persistent tube of the spathe [*esculenta*](#)

Colocasia esculenta (Linn.) Schott l.c. (1832); A. F. Hill in Bot. Mus. Leaf. Harvard 7: 113 (1939); Morton, W. Afr. Lilies & Orch. fig. 60. **APD acc**

Arum esculentum Linn. (1753).

Colocasia antiquorum Schott (1832)-F.T.A. 8: 164; Bot. Mag. t. 7364; Engl. l.c. 65.

Cultivated extensively in our area for the tuber (coco-yam) and frequently naturalized; the large leaves are seldom accompanied by flowers.

Native of tropical Asia.

8. XANTHOSOMA

Schott in Schott & Endl., Melet. 1: 19 (1832); Engl., Pflanzenr. 4, 23 E: 41 (1920).

- 1 Stout rhizomatous herb; petiole up to 60 cm. long, usually less; lamina sagittate 30-45 cm. long and 20-35 cm. broad with large basal lobes not over-lapping; peduncle 30-40 cm. long; spathe about 20 cm. long; spadix slightly longer than the spathe [mafaffa](#)

Xanthosoma mafaffa *Schott* Arac. Betreff. 2: 5 (1855); Engl. l.c. 51, fig. 9J

APD: *Synonym of Xanthosoma sagittifolium (L.) Schott*

Xanthosoma sagittifolium of authors, not of (Linn.) Schott.

Widely cultivated coco-yam, native of tropical S. America. Grown in the moister parts of our area and to about 5,000 ft in. W. Cameroun.

[X. mafaffa appears to be the species in West Africa, as mentioned by Dalziel (Appendix, p. 483), although unfortunately he used the name X. sagittifolium for the main heading. It would be useful to know whether true X. sagittifolium, with overlapping basal leaf lobes and tapering male portion of the spadix, occurs in our area.)

9. ANUBIAS

Schott in Oest. Bot. Wochenbl. 7: 398 (1857); F.T.A. 8: 182; Engl., Pflanzenr. 4, 23 DC: 2 (1915). *APD acc*

- 1 Leaves not hastately lobed, may be cordate (in No. 3): **2**
 Leaves hastately lobed: **5**
- 2 Spathe convolute, not opening at maturity, the spadix exserted; petioles not muricate at apex; lamina narrowly elliptic, acute at apex, 15-25 cm. long, 3-10 cm. broad, with numerous parallel lateral nerves spreading from the midrib at an angle of 45° with faint transverse tertiary nerves; spadix as long as or longer than the acuminate spathe [1. afzelii](#)
 Spathe opening at maturity, eventually partly reflexed: **3**
- 3 Spathe 3-5 cm. long; spadix as long as or longer than the spathe: **4**
 Spathe 1-1.5 cm. long, apiculate; spadix included, shorter than the spathe; petioles 3-17 cm. long; lamina narrowly elliptic 5-14 cm. long, about 1.5 cm. broad, cuneate at base, acute or obtuse at apex [4. minima](#)
- 4 Leaves broadest about the middle, lanceolate-elliptic, more or less narrowed to the base or slightly cordate, acute or slightly acuminate, 12-25 cm. long, 4-10 cm. broad, with numerous lateral nerves spreading from the midrib at an angle of about 80°; petioles more or less muricate, often densely so towards the base; spathe 3-5 cm. long, acuminate or cuspidate, narrow; spadix about as long as the spathe [2. lanceolata](#)
 Leaves broadest below the middle, cordate, truncate, rounded or exceptionally cuneate at the base, acute to acuminate at the apex, 15-25 cm. long, 5-10 cm. broad, glabrous except the puberulous midrib beneath, with numerous parallel lateral nerves spreading from the midrib at a wide angle; petiole slender, up to 30 cm. long, expanded and sheathing only towards the base, not tuberculate; peduncle very slender, about the same length as the leaves; spathe oblong-lanceolate, rather long-acuminate, 4-5 cm. long; spadix slender, longer than the spathe [3. barteri](#)
- 5 Leaves shallowly hastately trilobed, triangular in outline, about 12 cm. long and 10 cm. broad, lobes ovate-oblong, rounded at the apex, glabrous, with numerous lateral nerves; petiole about 25 cm. long, deeply grooved on one side; peduncles slender, 15 cm. long; spathe 2-5 cm. long, broadly elliptic, mucronate, spadix as long as the spathe, the upper three-quarters occupied by the male flowers [5. gracilis](#)
 Leaves deeply and variably trilobed, sometimes nearly compound; middle lobe ovate-triangular to lanceolate, shortly acuminate, acute to obtuse at apex, 11-24 cm. long, up to 10 cm. broad, lateral lobes oblong-lanceolate, obtuse, up to 16 cm. long and 6 cm. broad, all glabrous with numerous arcuate nerves; petiole and peduncle up to 30 cm. long; spathe 3-4(-8) cm. long, mucronate; spadix longer than the spathe [6. gigantea](#)

1. **Anubias afzelii** *Schott* in Oest. Bot. Wochenbl. 7: 399 (1857); F.T.A. 8: 183; Engl. l.c. 3; Chev. Bot. 683. *APD acc*

A gregarious herb of swamps or beside streams in forest; leaves with the lamina held erect, the petiole pulvinate at the apex; spathe green.

Sen.: Kantora, Haute-Casamance Etesse 15! **Guin.:** Ditinn and Diaguissa Chev. 12653! 12681! 12905 bis! Kindia Chev. 12714! R. Kalendé (June) Dybowski 8! Timbo (Apr.) Pobéguin 1573! **S. 10. AMAURIELLA

Rendle in Cat. Talb. 115, t. 16 (1913). *APD acc*

- 1 Stemless herb; lateral nerves of leaves very numerous and closely parallel; blade hastate or 3-partite nearly to the base with the segments unequal, the two lateral narrowly lanceolate, the terminal elliptic to obovate-elliptic, 15-20 cm. long, up to 10 cm. broad; peduncle slender, about 8 cm. long; spathe 2.5-3.5 cm. long; spadix as long as the spathe; males in a cylindric mass about 2 cm. long, anthers clustered on top of the synandrium; ovary 2-celled, with a thick disk-like stigma [hastifolia](#)

Amauriella hastifolia (Engl.) Hepper in Kew Bull. 22: 454 (1968).

APD: *Synonym of Anubias hastifolia Engl.*

Anubias hastifolia Engl., Bot. Jahrb. 15: 462 (1892). and in Pflanzenr. 4, 23 DC: 9, fig. 9 (excl. K, L).
Amauriella obanesis Rendle l.c. (caption A. talbotii Rendle in error) (1913).

Stemless herb with petioles about 1 ft. high; inflorescences much shorter with a small spathe 1-2 in. long.

IV. C.: Gbépleu waterfall, Mt. Tonkoui (Feb.) Aké Assi 7366! **Ghana:** Vane, Trans-Volta Reg. (June) Morton A3439! Chilinga and Shiare, Buem-Krachi Dist. (Aug., June) Morton A3977! Hall 1355! **S. Nig.:** Obani Talbot 1297! 1532.

Also in **E. Cameroun**.

11. ZANTEDESCHIA

Spreng., Syst. Veg. 3: 765 (1826); Engl., Pflanzenr. 4, 23DC: 61 (1915). Nom. cons.

Richardia Kunth (1815)-F.T.A. 8: 167, not of Linn.

- 1 Rhizomatous herb; leaves hastate, upper part elongate-oblong or elongate-deltoid, finely caudate-acuminate at apex, about 30 cm. long and 8 cm. broad, the basal lobes variable in shape and size with a marked sinus between them; petiole about 60 cm. long; peduncle as long as the petiole, smooth; spathe 8 cm. or more long, expanded slightly above, acutely and abruptly acuminate; spadix half as long as the spathe [angustiloba](#)

Zantedeschia angustiloba (Schott) Engl. Bot. Jahrb. 4: 64 (1883), and in Pflanzenr. 23DC 65; Hepper in Kew Bull. 21: 493 (1968).

APD: *Synonym of Zantedeschia albomaculata (Hook.) Baill. subsp. albomaculata*

Richardia angustiloba Schott (1865)-F.T.A. 8: 169.

Marsh herb with leaves and inflorescence 2 ft. and more high; spathe conspicuous shining yellow.

N. Nig.: Likitaba to Nguroje, Mambila Plateau, 5,500 ft. (July) Chapman 46!

Also in **Angola**, **Tanzania** and **Zambia**.

12. NEPHTHYTIS

Schott in Oest. Bot. Wochenbl. 7: 406 (1857); F.T.A. 8: 169; Engl., Pflanzenr. 4, 23C: 110 (1911).

- 1 Leaves with a rather deep and distinct sinus between the upper and lower lobes, lobes ovate-elliptic, acutely long-acuminate, 15-20 cm. long, 5-10 cm. broad, glabrous; petiole slender, 30-60 cm. high; peduncle about half as long as the petiole, slender; spathe decurrent on the peduncle, oblong-lanceolate, acutely acuminate, 3-5 cm. long; spadix subsessile, 1.5-2 cm. long [I. constricta](#)
- Leaves without or with only a very shallow sinus between the upper and basal lobes: **2**

- 2 Spadix subsessile within the spathe, 4-5 cm. long; spathe oblong-elliptic, not acuminate, 5-7 cm. long, many-nerved; leaves broadly triangular in outline, lobes broadly acuminate, about 10-17 cm. long; petioles smooth, 40 cm. long [2. afzelii](#)
- Spadix stipitate, stipe 1 cm. long; spathe abruptly acuminate, long-decurrent on the peduncle, finely spotted; leaves as in preceding but more narrowly acuminate, lobes 14-25 cm. long; petioles muricate, up to 120 cm. long [3. poissonii](#)

1. **Nephtytis constricta** *N. E. Br.* in Gard. Chron. 15: 790 (1881); F.T.A. 8: 170; Engl. l.c. 112, fig. 38 F-G.

APD: Synonym of Nephtytis poissonii var. constricta (N.E. Br.) Ntépé-Nyamè

Nephtytis talbotii *Rendle* in Cat. Talb. 114 (1913).

Herb with creeping rhizome, 1 in. thick, giving rise to several markedly sagittate leaves prominently veined; spathe pale green, reflexed in fruit; **in forest**.

S. Nig.: Okomu F.R., Benin (fr. Feb.) Brenan 8527! **W. Cam.:** Oban Talbot 766! Rio del Rey Johnston! **F.Po.:** (Dec.) Mann 106!

Also in **E. Cameroun**.

2. **Nephtytis afzelii** *Schott* in Oest. Bot. Wochendbl. 7: 406 (1857); F.T.A. 8: 171; Engl. l.c. 110, fig. 38 A-E; Chev. Bot. 683. *APD acc*

Nephtytis liberica *N. E. Br.* (1881).

Creeping rhizome about 1 cm. thick, giving rise to 1 to 3 hastate leaves about 1 ft. high; **fruits orange-yellow; in forest**.

S. L.: Afzelius (drawing)! York Pass (Dec.) Deighton 3325! **Lib.:** Bull (cult.)! Bushrod I. (fr. Aug.) Baldwin 13089! Duport (fr. Oct.) Barker 1440! Nyaake, Webo Dist. (fr. June) Baldwin 6146! **iv. C.:** Baléko Forest (fr. Jan.) Aké Assi 7311! Abouabou Forest (fr. Jan.) Leeuwenberg 2364! vide Chev. l.c. **Ghana:** Begoro (fl. & fr. Nov.) Morton A238!

3. **Nephtytis poissonii** (*Engl.*) *N. E. Br.* in F.T.A. 8: 171 (1901); Engl. l.c. 112, fig. 39 G-N. *APD acc*

Oligogynium poissonii *Engl.* (1883).

Nephtytis gravenreuthii (*Engl.*) *Engl.* l.c. 112, fig. 39 A-F (1911).

Herb with rather large hastate leaves about 4 ft. high from a rhizome 1 in. thick; spathe green, fruits fleshy, orange-red.

S. Nig.: Okomu F.R. (fl. & fr. Jan.) Brenan 8862! Omo River F.R., Ijebu Dist. (fr. Jan.) Onochie FHI 20679! Afl River F.R., Obudu Dist. (fr. May) Jones & Onochie FHI 18762! Oban Talbot 767! **W. Cam.:** Banga, S. Bakundu F.R. (fl. & fr. Mar.) Brenan 9302! 9414! **F. Po:** Ureko, 1,000-2,000 ft. (fl. & fr. Aug.) Thorold TF82!

Also in **E. Cameroun** and **Gabon**.

[Engler maintained that *N. gravenreuthii* has peduncles about half the length of the petioles whilst the peduncles of *N. poissonii* are much the same length as the petioles. The spathe is reputed to be smaller, more ovate and the stipe of the spadix shorter than in *N. poissonii*. Field observations would be useful. -F.H.I.]

Nephtytis sp. A.

A fruiting specimen with a sagittate leaf and narrow lobes 21-23 cm. long and about 4 cm. broad.

Lib.: Gbanga (fr. Sept.) Linder 573!

Imperfectly known species.

13. ANCHOMANES

Schott in Oest. Bot. Wochenbl. 3: 313 (1853); F.T.A. 8: 161. *APD acc*

- 1 Male portion of spadix about equal to the female; spadix about 1/4 as long as the spathe, lilac; spathe about 40 cm. long; petiole 1 m. or more high, prickly almost the entire length [3. nigritianus](#)

- Male portion of the spadix much longer than the female:**2**
- 2** Savanna woodland herb; spathe yellowish green; ovary smooth, green with prominent circular orange stigma; peduncle 60-120 cm. high; leaf developing after the inflorescence and about the same height, lamina up to 1 m. diam., much divided into numerous more or less rhomboidal lobes, each segment often with two apices**1.**
welwitschii
- Rain forest herb; spathe dark purplish, ovary pink or purple with a rather small white stigma; peduncle 90-200 cm. high; leaf developing after the inflorescence and taller, petiole up to 3 m. high, lamina 1-5 m. diam.:.....**3**
- 3** Ovary and style smooth or slightly warted**2a. *difformis* var. *difformis***
Ovary and style densely tuberculate**2b. *difformis* var. *pallidus***

Anchomanes giganteus Engl.

Aké Assi (Contrib. 2: 20 [229]) lists the above (Bot. Jahrb. 28: 419 (1889), described from the Congo, as native in Ivory Coast (Aké Assi IA 5722, 5724).

1. Anchomanes welwitschii Rendle in Cat. Welw. 2: 98 (1889); F.T.A. 8: 163; Morton W. Afr. Lilies & Orch. 46.

APD: Synonym of Anchomanes difformis (Blume) Engl.

Anchomanes difformis of F.W.T.A., ed. 1, 2: 359, partly (syn. *A. dalzielii* N. E. Br.).
Anchomanes difformis var. **welwitschii** (*Rendle*) Engl., Pflanzenr. 4, 23C: 55 (1911).
Anchomanes dalzielii N. E. Br. (1913).

Savanna herb similar to *A. difformis* but the leaf generally smaller, about 4 ft. high; spathes yellow-green, ovaries green and stigma orange.

Ghana: Achimota (Apr.) Bally 9! Legon (Mar.) Morton GC 6488! Anyaboni to Jaketi (Feb.) Morton GC 8429! **N. Nig.:** Kontagora Prov. (fl. & fr. June) Dalz. 563! Olohengia (Mar.) Meikle 1255! Abinsi (Apr.) Dalz. 862! Mambila Plateau, 4,600 ft. (Jan.) Hepper 1830! **S. Nig.:** Ijaiye F.R., Ibadan (Mar.) Keay FHI 21195!

Widespread in savanna zones of tropical Africa.

[Only those specimens where colour notes have enabled a positive identification to be made have been cited and the result may give an imperfect indication of the real distribution of this species.]

2. Anchomanes difformis (Bl.) Engl. in DC., Monogr. Phan. 2: 304 (1879), partly; Engl. l.c. fig. 21; F.W.T.A. ed. 1, 2: 359, partly (excl. syn. *A. dalzielii* N. E. Br.); Morton, W. Afr. Lilies & Orch. fig. 53. *APD acc*

Amorphophallus difformis Bl. (1835).
Anchomanes dubius Schott (1860)-F.T.A. 8: 163.

2a. Anchomanes difformis var. difformis Hepper in Kew Bull. 21: 491 (1968). *APD acc*

Moist forest herb with horizontal tuber up to 21/2 ft. long and 8 in. across giving rise to one enormous divided leaf about 8 ft. high with a prickly petiole; spathe dark purplish, ovaries purplish or pink and stigma white.

S. L.: Smeathman! Njala (May) Deighton 6066! **Lib.:** (cult., Sept.) Bull 1851a! **iv. C.:** Sassandra (Dec.) Leeuwenberg 2230! **Ghana:** Assin-Yan-Kumasi Cummins 211! Bame Pass (Oct.) [See note above after *A. welwitschii*.]

2b. Anchomanes difformis var. pallidus (Hook.) Hepper in Kew Bull. 21: 491 (1968).

APD: Synonym of Anchomanes difformis (Blume) Engl.

Anchomanes hookeri var. **pallida** Hook., Bot. Mag. t. 5394 (1863).
Anchomanes hookeri (*Kunth*) Schott (1853)-F.T.A. 8: 162.
Anchomanes difformis var. **hookeri** (*Kunth*) Engl. l.c. 56 (1911).
Anchomanes petiolatus (*Hook.*) Hutch., F.W.T.A., ed. 1, 2: 359 (1936).

F. Po: Boulton! (Dec.) Mann 107! El Pico, 4,800 ft., (Dec.) Boughey 163!

[Typical var. *pallidus* appears to be endemic to Fernando Po. However, warting of the ovary is rather frequently found in specimens from the mainland (*A. obtusus* A. Chev. (1909), Ivory Coast Chev. 16745!) but apparently not to the same degree as in those from Fernando Po.]

3. **Anchomanes nigritianus** Rendle in Cat. Talb. 114 (1913). *APD acc*

An inadequately known plant similar to the other species; leaf much divided with spiny peduncle 3-4 ft. high.

S. Nig.: near Etara, Oban (Oct.) Talbot 1247!

14. REMUSATIA

Schott, Melet. 1: 18 (1832); Gen. Aroid. t. 36 (1858).

- 1 A tuberous-rooted herb, the leaves accompanied by a peduncle bearing burr-like bulbils covered with hooked prickles; leaves ovate, peltate, cordate at the base, acutely acuminate, very variable in size, often tinged with purple below; spadix clothed with membranous leaf-sheaths, shortly pedunculate; spathe 8-10 cm. long, convolute around the female flowers, the male part of the short spadix exposed as the spathe reflexes; ovary 1-celled, ovules numerous [vivipara](#)

Remusatia vivipara (Roxb.) Schott Melet. 1: 18 (1832); Hook. f., Fl. Brit. Ind. 6: 521; Aké Assi, Contrib. 2: 21 [229]. *APD acc*

Caladium viviparum Roxb., Hort. Beng. 65 (1814).

Ditinnia rupicola A. Chev., Bot. 279, name only.

Epiphytic on trees by streams and associated with fern roots, or in moist cracks in rocks; flowers appearing rarely and during leafless stage, spathe greenish cream coloured, spadix whitish; bulbiliferous shoot leafless and brown.

Guin.: Ditinn Chev. 12839; 18500; 18531. Iles de Los, Conakry Mugnier-Serand 11! *S. L.*: Musaia (Sept.) Deighton, 4501! Roruks (Oct.) Deighton 4378! Kamasu (Dec.) Deighton 3824! Mafori (Oct.) Also in *E. Cameroun*, *Tanzania* and *Zambia*, and in the eastern tropics and sub-tropics.

15. CALADIUM

Vent., Descr. Pl. Nouv. Jard. Cels, 30 (1800); F.T.A. 8: 165.

- 1 Stemless herb with a tuberous rootstock and radical leaves; petioles up to about 30 cm. long, lamina sagittate, peltate, with a short acute acumen at apex, basal lobes obtuse, midrib 10-15 cm. long, lobes 7-12 cm. long, glabrous, glaucous, usually with irregular spots of white and red; peduncle about 2/3 length of the petiole, glabrous; spathe glabrous; tube about 3 cm. long, ovoid, limb boat-shaped, about 7 cm. long and 2 cm. diam., caducous; spadix shorter than the leaves, lacking an apical appendage [bicolor](#)

Caladium bicolor (Ait.) Vent. l.c. t. 30 (1800); F.T.A. 8: 166. *APD acc*

Arum bicolor Ait., Hort. Kew. 3: 316 (1780).

Thoroughly naturalized in several West African countries, occurring on roadsides and shady waste places in the forest region; leaves attractively mottled or coloured, appearing at the same time as the flowers; spathe greenish white.

Introduced from tropical America.

16. RHEKTOPHYLLUM

N. E. Br. in *J. Bot.* 20: 194 (1882); *Engl., Pflanzenr.* 4, 23, *Arac.*: 119 (1911).

- 1 Climber; leaves large, unequally pinnatisect or perforated (the juvenile entire and hastate-triangular), lobes obliquely acuminate, glabrous; spathe about 10 cm. long, enfolding the slightly shorter spadix; stigma sessile, disk-like; fruiting spadix about 7 cm. long; fruits obovoid, about 1 cm. long, capped by the sessile discoid stigma [mirabile](#)

Rhektophyllum mirabile *N. E. Br.* l.c. 195, t. 280 (1882); *F.T.A.* 8: 172.

APD: Synonym of Cercestis mirabilis (N.E. Br.) Bogner

A stout climber in forest 20-30 ft. high with long tapering roots into the ground from the upper parts, and clasping roots round the host stem; spathe pale yellow on both sides; male portion of spadix creamy yellow, female pink.

Dah.: Allada Poisson 03-6-5! **S. Nig.:** Epe Stanfield FHI 56575! Port Harcourt (Feb.) Stubbings 99! Afi River F.R., Ogoja Prov. (May) Jones & Onochie FHI 18747! Calabar to Mamfe (Mar.) Onochie FHI 34829! Calabar (May) Monteiro! **W. Cam.:** Mbaw Plain, Bamenda Brunt 468! Rio del Rey Johnston 2! **F. Po:** Barter! Mann 101!

Also in **E. Cameroun**, **Congo**, **Cabinda**, **Angola** and **Uganda**.

17. CULCASIA

P. Beauv., *Fl. Oware* 4 to ed. 3 (1803)5; *F.T.A.* 8: 173; *Engl., Pflanzenr.* 4, 23B, *Arac.-Pothoid.* 295 (1905).

- 1 Stem short and erect, not climbing (see also No. 9); with long stilt-like roots in No. 1:2
Stem more or less climbing:3
- 2 Upper end of the petiole sheath usually abruptly terminating within 5 mm. of the base of the lamina; petiole 3-5-5 cm. long; lamina oblanceolate (to linear) usually long-attenuate to the base, acute or gradually acuminate, 8-22 cm. long, (1-6-) 4-8 cm. broad; main lateral nerves about 12 on each side with prominent venation between; peduncle solitary; spathe 3-5 cm. long; fruit obovoid-ellipsoid, up to 2-5 cm. diam. in the dry state; stilt-like roots conspicuous [1. striolata](#)
Upper end of the petiole sheath more or less merging with the petiole 1-3 cm. from the base of the lamina; lamina broadly elliptic to ovate-elliptic, acute and not acuminate, 14-20(-30) cm. long, 9-12(-18) cm. broad, with about 10 pairs of wavy lateral nerves ascending within the margin, veins prominently reticulate beneath; petiole 6-10 cm. long, spathe 4 cm. long; roots hardly stilt-like [2. mannii](#)
- 3 Leaves cordate at the base, gradually acuminate or acute at apex, broadly lanceolate or oblong-lanceolate, 6-17 cm. long, 2-5-8 cm. broad, laxly reticulate beneath with few scattered linear immersed glands, glabrous, with 3-4 pairs of lateral nerves; petiole 1/4-1/3 as long as the lamina, sheathing nearly the whole length; peduncles 2-3 together, about 2 cm. long in flower, lengthening up to 5 cm. in fruit; spathe spiculate, about 1-5 cm. long .. [3. parviflora](#)
Leaves not cordate:4
- 4 Junction between the upper side of the petiole and the midrib interrupted by the lamina or by a transverse swelling; fruits spherical:5
Junction between petiole and the midrib uninterrupted, the lamina decurrent into the petiole:8
- 5 Lateral nerves looping near the margin; base of the lamina interrupting the junction of the petiole and midrib: ..6
Lateral nerves not looped near margin of leaves; junction of the petiole and midrib interrupted by a small transverse swelling; stems usually stout:7
- 6 Stems slender, 2-3 mm. diam., with numerous short internodal roots; peduncles solitary or paired, 3-6 cm. long, spathe 2-5-3 cm. long, spadix included; bract (if apparent) about 1-5 cm. long; lamina broadly elliptic, unequal-sided, cuneate or slightly rounded at the base, acute and hardly acuminate at the apex, 10-17 cm. long, 5-8 cm. broad, with about 6 principal lateral nerves on each side of midrib [4. scandens](#)
Stems rather stout, 5-10 mm. diam. or more; peduncles up to 8 together, 4-6 cm. long; spathe 3-3-5 cm. long, spadix slightly longer; bracts several up to 5 cm. long; lamina elliptic, narrowed to a slightly rounded base, acutely acuminate, 16-26 cm. long, 7-10 cm. broad, with numerous lateral nerves arising at nearly right angles to the midrib [5. liberica](#)
- 7 Leaves narrowed to the base, more than twice as long as broad, unequal-sided, 15-18 cm. long, 6-9 cm. broad, with numerous lateral nerves, about 8 pairs more conspicuous than the others; spathe about 4-5 cm. long,

- articulating at the base; stems about 5 mm. diam. [6. barombensis](#)
- Leaves broadly rounded or truncate at the base, only about twice as long as broad, up to at least 50 cm. long, with numerous lateral nerves, about 10 pairs more conspicuous than the others; petiole about half as long as the lamina, broadly sheathing in the lower three-quarters of its length; spathe about 7 cm. long, articulating at the base; bracts up to 14 cm. long, sometimes longer than the peduncle and spathe together [7. angolensis](#)
- 8 Leaves with each main lateral nerve curving towards the apex but not joining one another and not looping in a prominent intramarginal nerve, lamina lanceolate, cuneate at base, gradually acute or slightly acuminate at apex ending in a spine-like tip, 7-18(-23) cm. long, 1.5-8 cm. broad; petiole 2-9 cm. long; spathe about 2 cm. long [8. lancifolia](#)
- Leaves with main lateral nerves looped near the margin, at least in the upper half: [9](#)
- 9 Aerial roots few or absent from the upper internodes; plant often semi-erect; leaves broadly ovate to elliptic, shortly cuneate at the base, acuminate, 10-20 cm. long, 3-10 cm. broad; petiole 3-7 cm. long, 3/4 sheathed; peduncles 2-3, rather longer than the petioles; spathe 3-4 cm. long, the spadix well exerted [9. saxatilis](#)
- Aerial roots conspicuous; plant always climbing, stems slender: [10](#)
- 10 Peduncles longer than the petioles; leaves abruptly long-acuminate; petioles narrowly and shortly sheathed:.. [11](#)
- Peduncles shorter than the petioles; petioles broadly sheathed: [12](#)
- 11 Fruit and seed ellipsoid, stigmatic surface small, seed nearly 1 cm. long; peduncles often numerous or solitary, up to 13 cm. long; spathe 4 cm. long; spadix included, the female portion short; leaves oblong or oblong-elliptic, 15-28 cm. long, 2.5-7 cm. broad, the looped marginal nerve very prominent for the whole length of the lamina; peduncles up to 10 cm. long, slender, usually 1/4 sheathed [10. seretii](#)
- Fruit spherical about 3 mm. diam. with a large stigmatic surface; peduncles solitary, 6-7 cm. long; leaves elliptic, sometimes narrowly elliptic and attenuate at each end, 9-14 cm. long, 2.5-5 cm. broad [11. sapinii](#)
- 12 Fruit and seed ellipsoid, twice as long as broad, seed about 7 mm. long; spathe 3-3.5 cm. long, the spadix slightly exerted, male and female portions similar in length; leaves oblong to oblong-elliptic, shortly cuneate at the base, abruptly acuminate, somewhat unequal sided, 9-21 cm. long, 3.5-7 cm. broad, intra-marginal nerve conspicuously looped, linear pellucid immersed glands inconspicuous few or rather numerous; petioles broadly sheathed almost to the base of the lamina and ending in expanded ligules [12. tenuifolia](#)
- Fruit and seed hemispherical, seed about 5 mm. diam.; spathe 3-4 cm. long, the spadix inserted; leaves elliptic to obovate-elliptic, unequal sided, cuneate at base, acuminate, 11-14 cm. long, 4-6 cm. broad, conspicuously covered with numerous linear pellucid immersed glands; petioles sheathed nearly to the base of the lamina [13. glandulosa](#)

1. **Culcasia striolata** Engl. Bot. Jahrb. 26: 417 (1899); F.T.A. 8: 179, Engl., Pflanzenr. 4, 23B: 297; Chev. Bot. 678. *APD acc*

APD: Synonym of Culcasia dinklagei Engl.

Culcasia gracilis N. E. Br. in F.T.A. 8: 179 (1901); F.W.T.A., ed. 1, 2: 264.

Culcasia englerana A. Chev., Bot. 677, name only.

Erect herb of the forest floor about 1 ft. high with stout, ribbed, pubescent stilt-like aerial roots; spathe and spadix pale yellow green, berries red or orange.

Guin.: Dantilia (fr. Mar.) Sc. Elliot 5293! Macenta (fr. Oct.) Baldwin 9811! **S. L.:** Gbinti (fr. July) Deighton 2500! Kasewe F.R. (Nov.) Morton SL 1479! Njala (fr. Nov.) Alocasiophyllum kamerunianum Engl., Bot. Jahrb. 15: 449, t. 19 (1892).

A slender climber up trees and becoming epiphytic later, spathe dull greenish purple.

S. Nig.: Akure F.B., Ondo (fr. Aug.) Jones FHI 19526! Aponmu F.R., Ondo (fr. Aug.) J. B. Gillett 15315! Okomu F.R. (fl. & fr. Jan.) Brenan 8895! 9096! **W. Cam.:** Barombi (Apr.) Preuss 147. S. Bakundu F.R., Banga (Mar.) Brenan 9493!

Also in **Gabon**.

[Several Liberian specimens (Linder 1061, 1334, Baldwin 7085, 11445, 11484) are close to, if not conspecific with, *C. kamerunianus*. The leaves exhibit considerable variation in basal lobing from cordate to nearly sagittate and the leaves all possess thickened yellow margins. Small 585 (S.L., Gola Forest), with narrow cordate leaves lacking yellow margins, may also be this species.]

6. **Cercestis lanceolatus** Engl. l.c. 115 (1911).

APD: Synonym of Cercestis ivorensis A. Chev.

An inadequately known species.

W. Cam.: Buea Reder 1742!

LEMNACEAE

Small to minute floating or submerged herbs without roots or roots simple and thread-like, capped. Flowers monoecious, naked or at first enclosed in a membranous sheath. Perianth absent. Male flowers: stamens 1-2, with slender filaments or the latter thickened in the middle or absent; anthers 1-2-locular. Female flowers: ovary sessile, 1-locular; style and stigma simple; ovules 1-7. Seeds with fleshy or no endosperm; embryo straight, axile.

Temperate and tropical regions; in fresh water.

Duck-weeds are probably overlooked in many parts of W. Africa and they would repay careful attention in the field, especially for the presence of flowers which are seldom seen. (Hepper in Nig. Field 31: 18-21, with fig. (1966).)

- 1 Roots absent; flowers developing in upper surface of thallus; male flower solitary, anthers 1-locular:2
 Roots present; flowers developing in a lateral pouch; male flowers in pairs, anthers 2-locular:3
- 2 Thallus about 4 mm. long, thin, foliaceous, with internal air spaces; daughter thalli produced from linear transverse slit [1. Wolfffiella](#)
 Thallus about 1.5 mm. long, thick, more or less globular with fleshy parenchyma and without air spaces; daughter thalli produced from a round funnel-like pit [2. Wolffia](#)
- 3 Roots solitary on each thallus; thallus obscurely 3-nerved; no basal leaf produced with daughter thalli [3. Lemna](#)
 Roots several on each thallus, arising from a thickened part; thallus 5-11-nerved; young daughter thalli with a very thin leaf on each side at the base [4. Spirodela](#)

1. WOLFFIELLA

(*Hegelm.*) *Hegelm.* in Engl., Bot. Jahrb. 21: 303 (1895); Monod in Mém. Soc. Afr. Nord, Hors-Sér. 2: 229-242 (1949).

- 1 Thallus oblong, curved, concave, 4-6 mm. long, about 2 mm. broad, with undulate margin; daughter thallus budding from broader end; pair of flowers developed, one on each side of mid-line near broader end, 1 stamen with very short thick filament, 1 short style [1. welwitschii](#)
 Thallus in two parts; nearly opaque green floating portion, broadly elliptic, about 2 mm. long, 1.5 mm. broad, and hyaline oblong appendage 2-4 mm. long, 1 mm. broad, at right angles to the other and suspended in the water; budding pouch between the 2 parts arising from the thicker portion; flower apparently solitary near pouch, to one side of mid-line [2. hyalina](#)

1. *Wolffiella welwitschii* (*Hegelm.*) *Monod* in Mém. Soc. Hist. Nat. Afr. Nord, Hors-Sér. 2: 229-242, figs. 1-41 (1949). *APD acc*

Wolffia welwitschii *Hegelm.* in Seem., Journ. Bot. 3: 114 (1865); Hegelmaier, Lemnac. Monogr. 130, t. 4 figs. 1-10 (1868); F.T.A. 205; Koch in Ber. Schweiz. Bot. Ges. 41: 117 (1932); F. W. Andrews, Fl. Sudan 3: 284.

Thallus usually curved in a semicircle, the broadest part slightly above the water surface and exposing stamen and style; daughter thallus budding from apex of broadest part and curving beneath older thallus and thereby more or less completing the circle.

Sen.: near L. Ouïroual, Yombeul, Dakar Pitot (fide Monod l.c.). **Mali:** Soye, Bani Plain, Mopti (Dec.) Monod. **Ghana:** Akotokyir, Cape Coast. (Sept.) Hall 3036! **S. Nig.:** Okomu F.R. Brenan 8788!

Also in **Sudan**, **Angola** and reported from Venezuela, Cuba and S. Domingo.

2. *Wolffiella hyalina* (*Del.*) *Monod* l.c. 242 (1949). *APD acc*

Lemna hyalina *Del.* (1813).

Wolffia delilei *Schleid.* (1839)-F.T.A. 8: 204.

Wolffiella hyalina (*Del.*) *Hegelm.*, Lemnac. Monogr. 128, t. 4 figs. 11-19 (1868).

Lemna paucicostata of Chev. Bot. 685, partly (?); of F.W.T.A., ed. 1, 2: 366 (Chev. 1143), not of Hegelm.

Minute **floating herb** with colourless portion of the thallus suspended from the surface of the water.

Mali: Djenné Chev. 1143! **N. Nig.:** Zaria McFarlane!

Also in **C. African Rep.**, **Sudan** and **Kenya**.

2. WOLFFIA

Horkel ex Schleid. in Linnaea 13: 389 (1839); F.T.A. 8: 203.

- 1 Free floating minute herb 1-1.5 mm. long, rather less in breadth and depth, upper surface flattened and dark green, paler elsewhere; flowers opening on to upper surface from a single median pit; style short, stigma concave; stamen solitary with filament 0.5 mm. long; fruit ellipsoid, 0.7 mm. long, erect [arrhiza](#)

Wolffia arrhiza (Linn.) Horkel ex Wimm. Fl. Schles. 140 (1857); Hegelmaier, Lemnac. Monogr. 124, t. 2 figs. 6-17, t. 3 figs. 1-12 (1868); Jumelle in Fl. Madag. 32: 2 (1937). *APD acc*

Lemna arrhiza Linn. (1771).

Wolffia michelii Schleid. (1844)-F.T.A. 8: 205.

Locally abundant on permanent water, rarely flowering.

Sen.: Hann Raynal 5669! **Iv. C.:** Odienné Aké Assi! **Ghana:** Oduponkpehe, Accra to Winneba (fl. & fr. Sept.) Hall 3037! Mankessim Hall 2368! Weija Hall 3269! Cosmopolitan.

TYPHACEAE

Marsh, or lake herbs with creeping rhizomes, often tall, with simple stems submerged at the base. Leaves mostly radical, elongated-linear, rather thick and spongy. Flowers unisexual, anemophilous, very numerous, densely crowded on a terminal spadix, the male and female similar, the male above, the female below, the two sexes contiguous or remote from each other. Perianth of very slender jointed threads or elongated spatulate scales mixed with imperfect ovaries or stamens. Male flowers: stamens 2-5; anthers linear, basifixed. Female flowers: ovary 1-locular, stipitate. Fruit dry, at length splitting. Seed with a striate testa and mealy endosperm.

The reed maces of marshes in temperate and tropical regions; only one genus.

TYPHA

Linn., Sp. Pl. 971 (1753); F.T.A. 8: 135; Graebner in Engl., Pflanzenr. 4, 8 Typhac.: 8-18 (1900).

- 1 Bracteole absent from female flower; male and female portions of the inflorescence contiguous, female portion equalling or up to about twice as long as the male; anthers 2.5-3 mm. long; leaves smoothly rounded on the dorsal side, about 1 cm. broad [1. latifolia](#)
- Bracteole present on female flower; male and female portions of the inflorescence distinctly separated: **2**
- 2 Dorsal side of leaf smoothly rounded, 1 cm. broad, elongate-linear, closely nerved, with thin acute margins; anthers 2 mm. long [2. australis](#)
- Dorsal side of leaf angular especially towards the base where the leaf is more or less triangular in section, angle diminishing above, 1-1.5 cm. broad [3. elephantina](#)

1. **Typha latifolia** Linn. Sp. Pl. 971 (1753); Graebner in Engl., Pflanzenr. 4, 8 Typhac.: 8 (1900). **APD acc**

APD: *Synonym of Typha capensis (Rohrb.) N.E. Br.*

Tall aquatic herb up to 9 ft. high; female inflorescence brown; **in permanent water**.

N. Nig.: Katsina to Daura (Feb.) Meikle 1223!

Widespread in the tropics and temperate regions.

2. **Typha australis** Schum. & Thonn. Beskr. Guin. Pl. 401 (1827); F.T.A. 8: 135; Chev. Bot. 676; Berhaut, Fl. Sén. 186; Adam in Bull. I.F.A.N. 23: 399-405 (1961).

APD: *Synonym of Typha domingensis Pers.*

Typha angustifolia subsp. australis (Schum. & Thonn.) Graebn. l.c. 13 (1900).

A tall aquatic herb up to 12 ft. high with very long narrow leaves; inflorescences brown on tall stiff unbranched peduncles; **in permanent water**.

A tropical species, extending to E. and S. Africa.

3. ***Typha elephantina* Roxb.** Fl. Ind. 3: 566 (1832); Graebn. l.c. 11 (1900); Maire in Mém. Soc. Hist. Nat. Afr. Nord 3: 52 (1933); Adam l.c. (1961); A. Raynal in Ann. Fac. Sci. Dakar 9: 168 (1963). *APD*
acc

A herb growing on the edge of permanent water and invading bare or cultivated land.

Sen.: M'Boro, near Dakar (Dec.) Adam 17806! Ouayembam Trochain, Other localities near Dakar vide Adam & Raynal l.c.

A species with a subtropical distribution: also recorded from several localities in the Hoggar Mts. and Tibesti Mts., central Sahara, **Egypt** (?) and India.

\$/eflora

AMARYLLIDACEAE

Herbs with a tunicated bulbous rootstock or rarely a rhizome. Leaves few from the base of the stem or apex of the bulb, more or less linear, with parallel nerves and transverse secondary nerves. Flowers usually showy, bisexual actinomorphic, solitary to many and umbellate at the top of the scape, subtended by an involucre of two or more (rarely only one) usually membranous bracts. Perianth inserted below or usually above the ovary, petaloid, often withering and persisting, with or without a tube; segments or lobes 6, in 2 series, all equal and similar or the inner smaller or larger than the outer; corona often present. Stamens 6, opposite the segments, hypogynous or inserted on the tube or towards the base of the segments; filaments free or expanded at the base and connate and forming a "false" corona; anthers 2-locular, introrse, basifixed or versatile, opening by slits lengthwise. Ovary superior or inferior, 3-locular, with usually axile placentas; style slender, with a capitate or 3-lobed stigma. Ovules mostly numerous in each loculus. Fruit a capsule or a berry. Seeds with fleshy endosperm and small embryo, sometimes winged.

Temperate and warm-temperate regions, less frequent in the tropics.

- 1 Filaments free from each other to the base:2
 Filaments united with a basal cup to form a "false" corona; ovules numerous in each loculus of the ovary, in two series, spreading [3. *Pancratium*](#)
- 2 Flowers numerous and rather small, scarlet, pedicellate; ovules 1-2 in each loculus [1. *Haemanthus*](#)
 Flowers few and rather large, white or white with red stripes, sessile or subsessile; ovules usually several or numerous in each loculus [2. *Crinum*](#)

***Eucharis grandiflora* Planch. & Lindl.**

(White, with a corona)

Widely cultivated in our area as ornamental garden plants:

***Hippeastrum equestre* (Ait.) Herb.**

The Harmattan Lily (red)

Widely cultivated in our area as ornamental garden plants.

***Hymenocallis littoralis* Salisb.**

The Spider Lily (white with a corona).

Also in **C. African Republic.**

IRIDACEAE

Perennial herbs with underground rhizomes, corms or bulbs. Leaves often crowded at the base of the stem, mostly linear, flattened at the sides, sheathing at the base and equitant. Flowers hermaphrodite, actinomorphic, with a straight perianth-tube or the tube curved, or completely zygomorphic, usually ornamental and often mottled or spotted. Perianth petaloid, withering and persisting for some time; segments or lobes 6, 2-seriate, subequal and similar or different. Stamens 3, opposite the outer perianth-lobes; anthers 2-locular, opening by slits. Ovary inferior, 3-locular with axile, or 1-locular with parietal placentas; style 3-lobed, lobes sometimes petaloid. Ovules numerous. Capsule loculicidally dehiscent by valves. Seeds with copious endosperm.

Generally distributed throughout the world: most of the genera occurring in West Africa have many species in the southern part of the continent.

- 1 Style-branches petaloid; stamens opposite the style-branches; Iris-like flowers [1. *Moraea*](#)
Style-branches not petaloid; stamens alternate with the style-branches: **2**
- 2 Spathes many-flowered; stems compressed or winged [2. *Aristea*](#)
Spathes 1-flowered; stems not compressed: **3**
- 3 Flowers solitary, not spicate; leaves filiform-setaceous [3. *Romulea*](#)
Flowers spicate or cymose; leaves flat: **4**
- 4 Perianth-tube elongated and slender, many times as long as the limb; segments subequal [4. *Acidanthera*](#)
Perianth-tube comparatively short: **5**
- 5 Style-branches bifid; flowers cymose [5. *Lapeirousia*](#)
Style-branches or style entire: **6**
- 6 Perianth-segments subequal; seeds globose, not winged [6. *Hesperantha*](#)
Perianth-segments unequal; seeds usually winged: **7**
- 7 Perianth-limb oblique, not bilabiate [7. *Gladiolus*](#)
Perianth-limb bilabiate, the upper lobe hood-like, the 4 lower shorter and recurved [8. *Zygotritonia*](#)

Besides the above indigenous genera, several others are cultivated and some are more or less naturalized, such as monbretia (*Crocasmia aurea* Planch.) on Cameroon Mt., *Neomarica caerulea* (Lodd.) Sprague, *N. gracilis* (Herb.) Sprague and *Trimezia martinicensis* (Jacq.) Herb. All are from the New World.

1. MORAEA

Miller, Fig. Pl. 159, t. 238 (1758); F.T.A. 7: 338. Nom. cons.

- 1 Corm 2 cm. diam., giving rise to a peduncle about 30 cm. high and later to narrowly linear-lanceolate leaves up to 100 cm. long and 1 cm. broad, closely nerved, glabrous, rigid; stem-leaves bract-like, shortly overlapping each other and submembranous towards the apex; outer spathe-bract shorter than the inner, about 8 cm. long, closely nerved; ovary slightly exserted from the spathe, 2 cm. long; perianth 4-4.5 cm. long, mauve; capsule long-pedunculate, about 3.5 cm. long [schimperi](#)

***Moraea schimperi* (Hochst.) Pichi-Serm. in Webbia 7: 349 (1950). APD acc**

***Hymenostigma schimperi* Hochst. in Flora 27: 24 (1844).**

***Morea diversifolia* Bak. (1877)-F.T.A. 7: 339.**

***Moraea zambesiaca* Bak. (1877)-F.T.A. 7: 330; F.W.T.A., ed. 1, 2: 374.**

Highland plant with 1-3 mauve Iris-like flowers on stiff stems about 1 ft. high; flowers appearing after fire in the dry season, followed by the leaves.

N. Nig.: Vom, Jos Plateau, 4,000 ft. (Feb.) McClintock 199! Dent Young 245! Vogel Peak, Sardauna Prov., 5,400 ft. (Nov.) Hepper 1504! Mambila Plateau, 4,900-6,000 ft. (Jan.) Latilo & Daramola FHI 34380! Hepper 17741 **W. Cam.:** Bamenda to Santa (Jan.) Keay FHI 28345!

Widespread in the mountains of tropical Africa.

2. ARISTEA

Ait., Hort. Kew. 1: 67 (1789); F.T.A. 7: 346; H. Weimarck in Lunds Univ. Årssk. N.F. Avd. 2, 36: 1-140 (1940). *APD acc*

- 1 Capsules ovoid or oblong-ellipsoid about 5-9 mm. long, beaked by the spirally twisted perianth:2
Capsules cylindrical, elongate-oblong, 2 cm. long, valves with a deep groove in the middle; clusters of flowers 5-8 in an elongated spike; leaves about 30 cm. long, up to 1 cm. broad; (Sect. Pseudaristea) [3. ecklonii](#)
- 2 Clusters of flowers 7-10 in an elongated spike, axis of inflorescence slender, only lower portion slightly winged, inflorescence sometimes branched; basal leaves linear, up to 30 cm. long, stem leaves 4-6 reducing in size upwards, bracts subtending flower cluster about 8 mm. long, as long as the cluster; capsule 5-7 mm. long, 3-5-4 mm. broad; (Sect. Aristea) [1. angolensis](#)
Clusters of flowers 1-2, stems compressed and conspicuously winged; leaves linear up to 20 cm. long, 5 mm. broad, closely nerved; outer subtending spathe-bract leafy, longer than the flower cluster; floral bracts membranous; capsule 6-9 mm. long, 4-6 mm. broad; (Sect. Ancipites) [2a. alata subsp. abyssinica](#)

Also in **Tanzania** and **Rhodesia**.

6. HESPERANTHA

APD: Synonym of Hesperantha petitiana (A. Rich.) Baker

Ker-Gawl. in Kon. & Sims, Ann. Bot. 1: 224 (1804); F.T.A. 7: 348.

- 1 Corm very small, subglobose; leaves few, cauline, narrowly linear, flat, up to 17 cm. long, 1-nerved, grass-like; inflorescence about 3-flowered; outer spathe-bract broadly lanceolate, 1·5-2 cm. long, several-nerved, shortly tubular at the base; perianth 2-2·5 cm. long, segments as long as the tube; capsule 1·5 cm. long, valves 3-nerved; seeds globose, 1·5 mm. diam. [alpina](#)

***Hesperantha alpina* (Hook. f.) Pax ex Engl.** in Abh. Preuss. Akad. Wiss. 1891: 174 (1892); F.T.A. 7: 348.

***Geissorhiza alpina* Hook. f.** in J. Linn. Soc. 7: 223 (1864).

Simple erect herb nearly 1 ft. high; flowers pink.

W. Cam.: Cam. Mt., 8,000-10,000 ft. (fl. & fr. Nov.) Mann 2134! Johnston 18! Preuss 968.

7. GLADIOLUS

Linn., Sp. Pl. 36 (1753); F.T.A. 7: 360.

- 1 Flowering stems with well-developed leaves: **2**
 Flowering stems with short scale-like leaves or very short leaves: **5**
- 2 Leaves over 1 cm. broad; inflorescences about 1 m. high: **3**
 Leaves 0·5-1 cm. broad; inflorescences much less than 1 m. high; flowers not hooded: **4**
- 3 Perianth (incl. tube) over 6 cm. long, yellow or yellow with orange spots or reddish areas, upper segment of inner whorl hooded; bracts about 6 cm. long; leaves 1·5-4 cm. broad; capsule 2-4·5 cm. long, transversely nerved **1.** [psittacinus](#)
 Perianth (incl. tube) up to 4 cm. long, purple, all segments spreading; bracts about 3 cm. long, closely nerved; leaves 1-1·5 cm. broad; capsule 2 cm. long, faintly transversely nerved **2.** [klattianus](#)
- 4 Perianth (incl. tube) about 4 cm. long, purple or white, segments obtuse; bracts 2-4 cm. long, closely nerved; capsule 1·5 cm. long, smooth; leaves nearly 1 cm. broad, rigid **3.** [gregarius](#)
 Perianth (incl. tube) over 6 cm. long, pink, campanulate, segments acute; bracts 4-5 cm. long, with spaced nerves; capsule 2 cm. long, thin; leaves flaccid, up to 5 mm. broad **4.** [oligophlebius](#)
- 5 Bracts about as long as the perianth-tube, 1·5 cm. long; flowers mauve-pink or white, usually numerous on the very slender spike; leaves very short and closely appressed to the stem; perianth about 3 cm. long; anthers 7 mm. long; capsule 1·5-2 cm. long, closely mottled with carmine, thin, not transversely nerved **5.** [unguiculatus](#)
 Bracts much longer than the perianth-tube, about 3 cm. long; capsules strongly transversely nerved; leafy shoots

arising alongside the inflorescences, often tomentose:6

- 6 Flowers not hooded, 3 (-6) cm. long (incl. tube), pale pink or vermillion, sometimes darker spotted6. *melleri*
 Flowers hooded, 6-8 cm. long (incl. tube), yellow with reddish markings and spots (see note after citations) ...1. *psittacinus*

1. *Gladiolus psittacinus* Hook. Bot. Mag. t. 3032 (1830).

APD: Synonym of Gladiolus dalenii Van Geel subsp. dalenii

APD: Synonym of Gladiolus dalenii Van Geel

Gladiolus guartinianus A. Rich. (1851)-F.T.A. 7: 371; F.W.T.A., ed. 1, 2: 379.

Gladiolus primulinus Bak. (1890)-F.W.T.A., ed. 1, 2: 379; Morton, W. Afr. Lilies & Orch. fig. 45.

Gladiolus buettneri Pax (1892)-Chev. Bot. 683.

Gladiolus occidentalis A. Chev., Bot. 634, name only.

Erect rather robust herb 2-4 ft. high with sword-like leaves; flowers large and showy, pure yellow or variously spotted with red or heavily mottled (or rarely white); **in rocky savanna.**

Mali: Bamako (July) Waterlot 1618! **Guin.:** Dindea (June) Pobéguin! Fabala, near Kérouané (July) Collenette 76! Botola, near Kankan (July) Collenette 79! **S. L.:** Freetown (Aug.) Burbridge 506! Bintumane Peak, 5,000 ft. (May) Deighton 5086! **iv. C.:** Man to Touba (July) Collenette 53! Gouékouma, Toura Chev. 21664! Mt. Dourou (May) Chev. 21725! **U. Volta:** Banfora (July) Aké Assi 5703! Nig.:** Otokemeji (June) Foster 305!

Widespread in savanna in tropical and S. Africa.

[Smaller plants with pure yellow flowers are conveniently known as *G. primulinus* Bak., which appears to be only a colour form of *G. psittacinus*. Plants with leafless stems, sterile tomentose leafy shoots, commonly occur in the Bamenda area and also in highland E. Africa: they fall into the *G. psittacinus* complex.]

2. *Gladiolus klattianus* Hutch. F.W.T.A., ed. 1, 2: 379 (1936); Aké Assi, Contrib. 2: 24 [233].

APD: Synonym of Gladiolus gregarius Welw. ex Baker

Gladiolus spicatus Klatt (1867)-F.T.A. 7: 369, not of Linn. (1753).

Erect herb 2-4 ft. high with numerous reddish purple flowers in a long narrow spike; **in seasonally moist savanna.**

Sen.: Bignona, Casamance (Nov.) Berhaut 6439! **Mali:** Klela (Sept.) Demange 27541 **Port. G.:** Piche (Sept.) Pereira 3246! Piche to Canquelifá (Oct.) Esp. Santo 3108! **Guin.:** Kindia (Oct.) Widespread in tropical Africa.

6. *Gladiolus melleri* *Bak.* in J. Bot. 14: 334 (1876); Bot. Mag. t. 8626; F.T.A. 7: 362. *APD acc*

A herb with almost leafless stems 2-3 ft. high and pale pink flowers; [in rocky upland savanna](#).

N. Nig.: Jos, Plateau (fl. & fr. May) Lely P284! Naranda Mt., summit 5,800 ft. (May) Lely 190!

[Plants occurring in Zaria Prov. (Keay FHI 25812, 25870; G. V. Summerhayes 192) have densely tomentose sterile shoots but they appear to be part of the *G. melleri* complex.]

8. ZYGOTRITONIA

Mildbr. in Engl., Bot. Jahrb. 58: 230 (1923).

- 1 Leaves very narrow, at most 5 mm. broad, about 15 cm. long, those on the stem gradually smaller, acute; flowers in simple or branched spikes much longer than the basal leaves; perianth very zygomorphic, about 1.5 cm. long, the upper lobe very narrow and hood-like over the style and stamens, the remainder shorter and recurved; capsule 3-lobed, about 5 mm. long, slightly reticulate [1. praecox](#)

Leaves about 2 cm. broad, up to 30 cm. long, mostly about 2 towards the base of the stem, acute; flowers in a simple or 3-branched panicle, very similar to the above, but a little larger; capsule warted [2. crocea](#)

1. *Zygotritonia praecox* *Stapf* in Hook., Ic. Pl. sub. t. 3120 (1927). *APD acc*

Corm about 1 in. diam., covered with reticulate-fibrous tunics; flowering while nearly leafless, flowers white; capsule slightly pustulate; **in alluvial soil among grass.**

Mali: Kita (Aug.) Jaeger 8! **Guin.:** Bissikrima Pobéguin 1123, partly! **N. Nig.:** Abinsi (June) Dalz. 847!

2. *Zygotritonia crocea* Stapf in Hook., Ic. Pl. t. 3120 (1927). *APD acc*

Corm covered with a rather coarsely reticulate tunic; leaves and flowers appearing together; flowers yellow-green or tinged red; **in shallow soil in savanna.**

Mali: Sikasso (May) Demange 2214! **Guin.:** Bissikrima Pobéguin 1123, partly! **Ghana:** Nalerugu, Gambaga Dist. (June) Akpabla 689! **N. Nig.:** Zungeru (June) Dalz. 558! Mande F.R., Birnin Gwari Dist. (June) Keay FHI 25854! Ancho (May) Hepburn 142! Katsina (June) Dalz. 848! Magaji de Leeuw 812b! **S. Nig.:** Enugu Floyer 4! Nsukka (July) Tuley 801! Ngwo, Udi Dist. (Aug.) Jones FHI 6165!

[Very close to the Sudanese *Z. bongensis* (Pax) Mildbr. (1923) from which it differs in the curled lower perianth segments and, possibly, in having broader leaves-F.N.H.]

DIOSCOREACEAE

Climbers (at least the West African species), spiny or not, annual or perennial with tubers annually renewed or perennial. Tubers toxic or edible, often protected by thorny roots. Aerial tubers (bulbils) present or absent. Stems glabrous or pilose. Leaves alternate or opposite (sometimes both on the same plant), often cordate, entire or lobulate, more or less digitately nerved or palmately compound, acuminate often large and glandulose. Petiole generally twisted and sometimes jointed at the base or with more or less leathery auricles. Basal leaves often reduced. Leaves moving, following the conditions of lighting. Plants dioecious; exceptionally on the same inflorescence are clustered male and female flowers. Inflorescence spicate, racemose or paniculate. Flowers small, inconspicuous, actinomorphic. Perianth campanulate or spreading, 6-lobed, lobes 2-seriate, often connate at the base. Male inflorescences: spikes generally several in the leaf axils, sometimes clustered in racemes or compound panicles. Male flowers sessile or shortly pedicelled. Bracteole generally present in oblique position. Flowers placed singly along the axis or in short few-flowered lateral cymes. Stamens 6, or 3 with or without 3 staminodes. Filaments free or shortly connate; anthers 2-locular. Rudimentary ovary frequent. Female inflorescences: spikes looser, longer than the male ones, solitary or paired or sometimes more numerous, in the leaf axils. Staminodes 0, 3 or 6. Ovary inferior, 3-locular. Style 3, free or connate. Placentation axile: 2 anatropous ovules in each loculus. Fruits (in the tropical African species) 3-valved capsules. Seeds winged, with albumen.

Distributed in all the intertropical countries; also present in the subtropical and temperate regions.

The tubers (yams) of some species of *Dioscorea* form an important food crop.

DIOSCOREA

Linn., Sp. Pl. 1032 (1753); *Kunth*, Enum. Pl. 5: 325 (1850); *Pax* in *E. & P.*, Pflanzenfam. 2, 5: 133 (1887); *F.T.A.* 7: 414 (1898); *Knuth* in *Engl.*, Pflanzenr. Diosc. 4, 43 (1924); *Prain & Burkill* in *Ann. Roy. Bot. Gard. Calcutta* 14: 302 (1938); *Burkill* in *Bull. Jard. Bot. Brux.* 15: 345 (1939).

KEY TO PLANTS WITH FEMALE FLOWERS OR FRUITS OR ONLY IN VEGETATIVE CONDITION

- 1 Twining stems sinistrorse (twining to the left i.e. clockwise as seen from above); capsules longer than broad with negative geotropism:2
- Twining stems dextrorse (twining to the right, i.e. anticlockwise as seen from above); fruits as broad as or broader than long; seeds attached near the middle of the placenta, annular more or less circular wing:7
- 2 Leaves compound, palmate; seeds winged at one end only:3
- Leaves entire, generally deeply cordate; seeds winged almost all round:4
- 3 Plants spiny and pubescent (some varieties glabrescent); leaves trifoliate; lateral leaflets asymmetrical,

- sometimes (principally the basal ones) lobulate or bilobed, median leaflet oblong, 8-18 cm. long, 5-10 cm. broad, 3-nerved from the base, setulose-pubescent above, softly tomentose beneath; petioles often spiny;  flowers in slender axillary spikes, softly tomentose all over; fruits oblong, 4 cm. long, 2 cm. broad (Fig. 369a) [1. dumetorum](#)
- Plants not spiny, more or less pubescent; leaves (3-) 5 (-7) foliolate, central leaflet 4-10 cm. long, 2-5 cm. broad with one median nerve, minutely and sparsely pubescent above, shortly and sparsely pubescent beneath or glabrescent; petioles not prickly;  flowers in short solitary or geminate-pedunculate spikes; fruits oblong-elliptic, 20-25 by 12-16 mm. (Fig. 369b) [2. quartiniana](#)
- 4** Plants with spiny stems and roots, pubescent (T-shaped hairs); leaves as broad as or broader than long, heart-shaped, 9-15-nerved, 6-10 cm. long, 8-10 cm. broad; petiole spinulose; plants sterile in West Africa, otherwise  flowers shortly pedicellate (1mm.) in long spikes (up to 40 cm.), perianth 3 mm. long, very small staminodes present; fruits reflexed 25-27 mm. long (Fig. 369c) [3. esculenta](#)
- Plants not spiny: **5**
- 5** Stems often winged or angular; plants robust, tomentose (T-shaped hairs more or less caducous), some forms glabrescent; leaves broadly ovate, cordate at the base, obliquely acuminate, acumen elongate, 9 main nerves and numerous transverse nerves, 10-30 cm. long, 8-35 cm. broad, villous-tomentose beneath, more or less pubescent or glabrous above;  inflorescences solitary, pendulous, up to 40 cm. long; fruits ascending, oblong, 50-60 by 30-40 mm. narrowly winged, pilose at first then glabrous; seeds with a prominent wing at each end (Fig. 369d) [4. preussii](#)
- Stems terete sometimes slightly furrowed, unarmed; plants glabrous, with bulbils; inflorescence pendulous;  flowers subsessile; fruits ascending: **6**
- 6** Leaves opposite in all mature plants except at the base of the stems; basal leaves often lobate or lobulate, the others entire, cordate at the apex bearing a long (up to 6 cm.) thick, glandular drip-tip; 9-11 main nerves, 10-20 cm. long, 12-45 cm. broad; petioles as long as the blades, with basal, thickened auricles; inflorescences 1-3 per node, up to 80 cm. long;  flowers subsessile, with six staminodes; fruits large, 50-60 by 18-25 mm.; seeds winged at both ends (Fig. 371d) [5. sansibarensis](#)
- Leaves entire, always alternate, broadly ovate, widely cordate at the base and apiculate to acuminate at the apex, 6-20 cm. long, 6-20 cm. broad; petiole slightly winged at the margins and auriculate at the base;  inflorescences 1-6 per node, up to 25 cm. long; fruits oblong-ellipsoid, 20-30 by 12-16 mm. (Fig. 371g) [6. bulbifera](#)
- 7** Plants pubescent, covered with stellate or branched hairs; lamina entire, cordiform with 7-9 main nerves; fruits reflexed (negative geotropism): **8**
- Plants glabrous except for a few club-shaped hairs, sparse or very fugacious juvenile hairs; capsules not reflexed (positive geotropism): **9**
- 8** Leaves minutely puberulous above (sometimes glabrescent), lamina 6-12 cm. long and nearly as broad;  spikes 1-5, 10-20 cm. long; perianth and ovary tomentose, fruits rounded, 18-20 by 20-25 mm.; seeds with rounded wings (Fig. 371c) [7. hirtiflora](#)
- Leaves with stellate indumentum, lamina 6-15 cm. long and nearly as broad;  inflorescences 10-15 cm. long; fruits about 25 mm. long with trapezoidal wings; seeds winged all round [8. schimperana](#)
- 9** Stems quadrangular, 4-winged; leaves opposite, sometimes alternate (at the base) or verticillate in 3's or 4's deeply cordate, elongate acuminate, broadly ovate, sinus deep, sometimes with overlapping lobes, 7-nerved, 6-22 cm. long, 5-18 cm. broad;  spikes simple, solitary, axillary, glabrous; fruits emarginate, 20-25 mm. long, 30-35 mm. broad; seeds suborbicular, winged all round (Fig. 370h) [9. alata](#)
- Stems terete, not winged, sometimes fluted or with narrow furrows: **10**
- 10** Stems perennial; stems very spiny especially in the basal area, rooting at the nodes when these are in contact with the soil; leaves coriaceous, epidermis hard to remove; rootstock hard, woody at soil level but bearing tubers deep in the ground: **11**
- Stems annual: **12**
- 11** Leaves orbicular or suborbicular, 5-7-nerved, veins from each side of the midrib embracing a broad obovate area, apices often overlapping, principally on those of the base, acumen abrupt, short (2-5 mm.), cornet-shaped, glandulose at least on the basal leaves, sinus shallow or absent, margins rounded overlapping slightly; lamina 6-17 cm. long, 6-17 cm. broad; fruits pruinose, 25-30 by 40-45 mm. (Fig. 370k) [10. minutiflora](#)
- Leaves ovate or ovate-lanceolate or ovate-oblong, 3-ribbed, the two outer ones very close to the margin of the leaf, rounded or rounded-cuneate at the base, sometimes indented; lamina 6-10 cm. long, 4-7 cm. broad; fruits pruinose, 23-28 by 32-42 mm. (Fig. 370l) [11. smilacifolia](#)
- 12** Tubers perennial; stems spiny: **13**
- Tubers annually replaced; leaves herbaceous or firm, not coriaceous: **14**
- 13** Stems 15-25 mm. thick, very young branches with a light fugaceous pubescence; leaves firm to coriaceous, similar to those of No. 10 but less hard and with a flat acumen not rolled to form a cornet and more or less spatulate-lanceolate, thick, glandulose, reddish or yellowish; lamina 5-12 cm. long, 4-10 cm. broad, 5-7-

- ribbed, network less dense than that of No. 10 with which this species shows great resemblance (Fig. 370m) [12. burkilliana](#)
- Stems 25-50 mm. thick, towards the base; basal leaves very modified, reduced to a pair of leathery auricles terminating in a very long acumen with reflexed margins making a kind of glandulose and thickened spindle; leaves alternate at the base, then opposite, not coriaceous, shortly cordate, 5-7-ribbed, 5-12 cm. long, 4-10 cm. broad;  flowers with 6 minute staminodes; fruits 20-27 mm. long, 30-36 mm. broad (Fig. 370n) [13. mangelotiana](#)
- 14** Plants of small stature bearing bulbils, stems wiry, mottled with red; leaves glaucous, more or less cordate to rounded at the base, often mucronate at the apex; lamina firm, thickish, 6-10 cm. long, 3.5-7 cm. broad, 5-7-ribbed, venation hardly visible; fruits rather small, 17-21 by 22-26 mm. (Fig. 370o) [14. togoensis](#)
- Plants without bulbils: **15**
- [15b. cayenensis subsp. rotundata](#)
- 15** Cultivated plants with superficial tubers; leaves frequently modified, reduced, often alternate at the base, opposite above; lamina sinus rather deep but with a deltoid attachment to the petiole, 5-7 nerved, the veins on either side of the midrib forming an acute angle (less than 45-50°), 6-12 cm. long, 5-10 cm. broad; 1-2 short  spikes (rarely exceeding 10 cm. in length), few-flowered, axillary (Fig. 370p) 15. cayenensis **16**
- Wild plants, tubers deep-seated or else protected by spiny roots; leaves herbaceous: **17**
- 16** Resting period short, two harvests in the season
- Resting period long, one harvest in the season [15a. cayenensis subsp. cayenensis](#)
- 17** Leaf length (measured along the midrib) less than 1.8 times the width, maximum width above the lowest quarter of the midrib (somewhere near the middle): **18**
- Leaves narrow, their length (measured along the midrib) equal to or more than 1.8 times the width, the maximum width in the lowest quarter of the lamina, or at the petiolar attachment, or even lower: **20**
- 18** Plants non-spiny; leaves cordate-ovate, basal lobes rounded, venation on either side of the midrib fairly close; tubers deep-seated (Fig. 370q) [16. abyssinica](#)
- Stems and roots spiny; basal leaves often modified and reduced to stipular formations (connivent when the leaves are opposite) and to an acumen of variable length: **19**
- 19** Plants sturdy, stems often pruinose, brown, red or purplish, stem 15-20 mm. thick; leaves shortly cordate (Fig. 370r) [17. praehensilis](#)
- Plants weaker, green; thickness of the stem generally less than 15 mm.; leaves deeply cordate more or less hastate, greatest width distinctly above the petiolar attachment (Fig. 370s) [18. liebrechtsiana](#)
- 20** Stems unarmed; leaves lanceolate, generally opposite, 5-7-ribbed, 8-12 cm. long, 3.5-6 cm. broad (Fig. 370t) [19. lecardii](#)
- Stems spiny at the least at the base; leaves long, sagittate, generally alternate (but not always), 5-7-ribbed, basal lobes of the lamina divergent, 9-16 cm. long, 3-6 cm. broad (Fig. 370u) [20. sagittifolia](#)

KEY TO PLANTS WITH FLOWERS

- 1** Male flowers with 3 fertile stamens and 3 staminodes; axis of the inflorescence pilose: **2**
- Male flowers with six fertile stamens: **4**
- 2** Inflorescences dense, formed of short axillary tomentose fasciculate spikes, axis not visible between the flowers; bracteoles absent; bract embracing the flower; staminodes linear or petaloid, with an entire or bifid apex; anthers sessile, on very short filaments (Fig. 371a) [2. quartiniana](#)
- Inflorescences more or less lax, axis generally visible between the flowers; bract not embracing the flower: **3**
- 3** Simple or branched racemes, 20-25 cm. long, clustered in the leaf axils; bract subulate; bracteole present; flowers 3-4 mm. distinctly pedicellate; perianth villose (T-shaped hairs); flowers opening wide at anthesis, possessing a small disk; stamens with short filaments curved over the disk; staminodes linear, at times bifid in the upper part (Fig. 371b) [4. preussii](#)
- Spikes 5-10 cm. long, fasciculate, 4-6 in the leaf axils; inflorescences forming long pendent more or less leafy racemes; axis and perianth covered, as on the stems, with characteristic stellate or dendroid hairs; flowers shortly or scarcely pedicelled, 3-5 mm. diam., solitary along the axis; at anthesis, sepals forming a roof, coherent at the tip, free in the middle part; stamens with a short filament and often a well-developed connective, staminodes long (Fig. 371c) [7. hirtiflora](#)
- 4** Inflorescence-axis pubescent: **5**
- Inflorescence axis glabrous: **7**
- 5** Inflorescence an axillary or terminal much-branched panicle of dense spikes, spikes formed of the cymules of 2-6 flowers crowded together, sessile, obscuring the axis; flowers small with glabrous perianth, protected by very pubescent bracts; perianth opening little or very little; stamens 6, at least in the first flowers of the cymules, in the successive flowers 4 or 5 stamens or fewer, filaments short, shorter or equal to the anthers (Fig. 371f) ... [1.](#)

dumetorum

- Inflorescences lax, axis visible between the flowers; flowers sessile and isolated on the axis:6
- 6 Perianth villous outside (hairs not stellate); stamens inserted on the tube, rudimentary ovary subpyramidal; flowers over 3 mm. long, sterile; bulbils absent (Fig. 369c) [3. esculenta](#)
- Perianth hairs stellate; flowers 2.5 mm. long or less at anthesis; bracts equal to or more than half the flower length; bulbils present [8. schimperana](#)
- 7 Flowers elongate, more than 3 mm. long, white at anthesis; bulbils present:8
- Flowers spherical, more or less fleshy, sessile, glabrous, small, 2.5 mm. long or less, perianth not opening wide at anthesis; bulbils absent:9
- 8 Spikes 20-40 cm. long, single or geminate, between the purple bulbil and the branches or forming a terminal panicle, rhachis striate or angular often with nectariferous glands; flowers solitary or 2-4 in cymes, 5-6 mm., subsessile, parts free at the top but not opening wide at anthesis; filaments of the stamens long (Fig. 371d) ..[5. sansibarensis](#)
- Spikes shorter, 3-12 cm. long, often united to form more complex inflorescences, aphyllous, about 20 cm. long or sometimes shorter; individual spikes pendulous or recurved toward the stem; flowers sessile, 3-6 mm. long; stamens of the outer whorl longer than those of the inner one (Fig. 371g) [6. bulbifera](#)
- 9 Stems winged, quadrangular; spikes in axillary panicles, aphyllous, 15 cm. long or more; spikes with 12-20 flowers alternately disposed on a zigzag axis; perianth 1.5-2 mm. long, disk thick; sepals ovate-elliptic; petals subspathulate; stamens short; anthers globose (Fig. 370h) [9. alata](#)
- Stems terete: 10
- 10 Male flowers on slender axes and rather less than their own diameter apart; leaves herbaceous or firm (plant not coarse); tertiary nervation relatively sparse, epidermis easily removed; spikes in clusters of 2-4 in the leaf axils; often forming large aphyllous inflorescences at least at their extremities: 11
- Male flowers generally on stout rigid axes of approximately the same diameter or rather more; geotropism nil:16
- 11 Stems spiny: 12
- Stems and roots not spiny; tubers annual: 15
- 12 Stem more than 2.5 cm. diam.; floriferous spikes with negative geotropism; tubers perennial; roots spiny; forest plant (Fig. 370n) [13. mangelotiana](#)
- Stems 2.5 cm. diam. or less; floriferous spikes with absent or positive geotropism; tubers replaced annually; roots spiny: 13
- 13 Leaves cordiform or more or less triangular, less than 1.8 times as long as broad: 14
- Leaves sagittate, 1.8 times or more longer than broad (Fig. 370u) [20. sagittifolia](#)
- 14 Male flowers with a narrow base (Fig. 371e) [18. liebrechtsiana](#)
- Male flowers with a broad base (Fig. 370r) [17. praehensilis](#)
- 15 Leaves cordate or more or less triangular, less than 1.8 times as long as broad (Fig. 370q) [16. abyssinica](#)
- Leaves long, sagittate or hastate, 1.8 times or more longer than broad (Fig. 370t) [19. lecardii](#)
- 16 Leaves herbaceous or firm, tertiary network of veinlets relatively diffuse: 17
- Leaves coriaceous, nerve network dense, epidermis removed with difficulty or not at all; floriferous axes stout, divergent, usually 8 or more per axil; inflorescences generally complex, aphyllous, sometimes branched; rootstock woody, hard, with fluted tubers at the base; stems spiny: 18
- 17 Bulbils small, 4-16 mm., with 1 or rarely 2 buds between the leaves and spikes; stems mottled, green and red; spikes 3-6 cm. long, 2-4 spikes in leaf-axils; leaves generally opposite at the inflorescence level, not spiny (Fig. 370o) [14. togoensis](#)
- Bulbils absent, plants unarmed or spiny, many cultivars and clones more or less hybrid; flowers in spikes, few in number (1-2 (-3) in the leaf-axils); spikes relatively short, rarely more than 5-6 cm. long, with a tendency to the reduction of sexual reproduction (Fig. 370p) [15. cayensis](#)
- 18 Aerial system annual; stems not rooting at the nodes (Fig. 370m) [12. burkilliana](#)
- Aerial system perennial; stems partially creeping on the ground, easily rooting at basal nodes: 19
- 19 Primary veins of leaves 5-7, the first pair embracing a broadly lanceolate area; lamina cordate, orbicular to oblong (Fig. 370k) [10. minutiflora](#)
- Primary veins of leaves usually 3, the first pair near the leaf margin, lamina elliptic or ovate, rounded at the base or with a small cleft (Fig. 370l) [11. smilacifolia](#)

Helmia dumetorum Kunth (1850).

Dioscorea buchholziana Engl. (1886).

Dioscorea triphylla var. *dumetorum* (Kunth) Knuth, illegit. name.

Spiny climber, 9 ft. high, with rather prickly bulbils; annual tubers, several per plant and a common bead, near the soil surface; the species includes more or less poisonous wild varieties as well as cultivated edible varieties with either white or yellow-fleshed tubers.

Dioscorea sativa of F.T.A. 7: 415, partly of Linn.
Dioscorea violacea Baudon (1913).
Hemia bulbifera (Linn.) Kunth (1860).

Glabrous non-spiny climber 10-20 ft. high, with bulbils 1-8 cm. in size, toxic or edible according to the variety; tubers renewed annually, globose, absent in several varieties or according to the method of cultivation; female flowers, when produced, white turning pink and then purple when old. Some edible cultivated varieties with large leaves have lost their ability to produce flowers, the bulbils are then larger and composed of a larger number (4-5) of buds. Wild varieties with toxic, angular, greyish bulbils and medium-sized leaves occur and others with small purplish bulbils, small leaves with a red base to the petiole.

Dioscorea sapinii De Wild. (1912).

Glabrous climber with winged stems 10-25 ft. high, rarely flowering in our area and usually reproducing vegetatively; bulbils developed in some forms; tubers annual, their shape, size and colour very variable according to the cultivars.

Asiatic species, native of E. India, formerly introduced into E. Africa by Arabs, later in W. Africa by the Portuguese. Widely distributed in W. Africa principally from Ivory Coast to W. Cameroun.

Numerous varieties producing many different types of tubers, digitate or not, straight, curved or coiled having white, pink or purple flesh. They play an important role in the agricultural economy of W. Africa. Much cultivated throughout the tropics.

Dioscorea lecardii *De Wild.* (1903).

Climber with stem spiny at least towards the base, 10-15 ft. high, tubers deep or protected by spiny roots.

Sen.: Tobor Forest, Bignona, Casamance & Tambacounda Berhaut 6429! 6749! **S. L.:** Makump Glanville 1524! **iv. C.:** Odienné, Oddia, Niempurgué & Soriforo Miége 1927! 2018! **U. Volta:** Banfora Falls Miége 1914!

AGAVACEAE

Rootstock a rhizome; stem short or well developed. Leaves usually crowded on or at the base of the stem often thick and fleshy, entire or with prickly teeth on the margin. Flowers bisexual, polygamous or dioecious, racemose to paniculate or subcapitate, sometimes in a very large thyrses, bracteate. Perianth segments free or united; corona never present. Stamens 6, inserted at the base of the lobes or on the tube; filaments filiform or thickened, free; anthers introrse, 2-locular, opening lengthwise. Ovary superior or inferior, often beaked, 3-locular, with axile placentas; style slender. Ovules numerous and superposed in two series to solitary. Fruit a capsule or berry. Seeds with fleshy endosperm.

Those genera of this family which are native in our area possess superior ovaries.

- 1 Herbs, shrubs or trees; stems and leaves usually not fibrous; leaves flat, not greatly thickened; fruit a berry [1. *Dracaena*](#)

Herbs with creeping rhizomes; stems and leaves usually fibrous; leaves erect, thick and fleshy; fruit with a thin pericarp falling away from the berry-like seeds [2. *Sansevieria*](#)

Agave sisalana Perrine ex Engelm.

The sisal plant and other *Agave* species, also the Mauritius hemp have been introduced into our area and they occasionally become more or less naturalized.

They are all American plants and they possess inferior ovaries.

Furcraea gigantea Vent.

F. selloa Koch

Cordyline terminalis Kunth

From tropical Asia, it is also cultivated in gardens.

With superior ovaries.

1. DRACAENA

Vand., Diss. (1762); F.T.A. 7: 436. *APD acc*

Pleomele *Salisb.* (1796)-N. E. Brown in Kew Bull. 1914: 273.

- 1 Herbs or at most undershrubs; lamina ovate or ovate-lanceolate, broadest at or below the middle, rather abruptly narrowed into a usually long slender petiole: [2](#)
- Shrubs or trees; lamina obovate to linear-oblong-lanceolate or linear, broadest about the middle, if elliptic then subsessile or shortly petiolate: [6](#)
- 2 Inflorescence spicate-racemose: [3](#)
- Inflorescence capitate; leaves ovate or ovate-elliptic: [4](#)
- 3 Inflorescence about 10 cm. long, shorter than the leaves, simple; perianth 12 mm. long, erect; fruit 2-3-lobed, fleshy; stem hardly developed, nodes congested; leaves ovate-lanceolate, 20-31 cm. long, 5-7 cm. broad, with numerous close parallel nerves and distinct transverse veins; petiole nearly as long as the lamina, slender, gradually broadened into a striate sheath at the base [1. *humilis*](#)
- Inflorescence about 30 cm. long, usually longer than the leaves, simple or with a few short lateral branches; perianth about 25 mm. long; stem distinctly developed; leaves oblong-lanceolate to ovate-lanceolate, (12-) 18-39 cm. long, (3-) 5-8 cm. broad [2. *thalioides*](#)
- 4 Petiole winged its full length, as long as or longer than the blade; blade ovate, acutely acuminate, 10-15 cm. long, 5-8 cm. broad, with numerous parallel nerves and distinct cross-veins; perianth 1.5 cm. long; fruiting head sessile [3. *elliottii*](#)
- Petiole winged only at the base and apex: [5](#)
- 5 Petiole nearly as long as or longer than the blade, slender; blade mottled, ovate-elliptic, acuminate, 15-25 cm.

- long, 6-10 cm. broad, faintly nerved; inflorescence capitate shortly pedunculate; bracts caudate-acuminate; fruit spherical, 1.5 cm. diam. [4. phrynioides](#)
- Petiole much shorter than the blade, the latter transversely variegated, ovate-elliptic, very acutely acuminate, 12-25 cm. long, up to 14 cm. broad; inflorescence sessile, 5 cm. diam.; bracts long-acuminate; perianth 3 cm. long [5. goldieana](#)
- 6** Lamina more or less elongate-linear, linear-lanceolate or oblanceolate: **7**
- Lamina elliptic to obovate or rarely broadly lanceolate: **16**
- 7** Trees; inflorescences paniculate: **8**
- Shrubs; lateral nerves spaced 0.5-1 mm. apart usually with transverse veins between: **11**
- 8** Pedicels very short and inconspicuous, at most 2 mm. long; perianth 1 cm. long; lateral nerves of the dry leaves fine, numerous and contiguous or nearly so, oblique transverse veins also visible; leaves 100 cm. or more long, up to 12 cm. broad, sheathing at the base, acute and mucronate at the apex; inflorescence a large branched panicle; lowland tree [6. smithii](#)
- Pedicels conspicuous, leaving fruiting "pegs" 4-5 mm. long: **9**
- 9** Leaves 6-7 cm. broad, very long, with very numerous subcontiguous nerves; bracteoles persistent on the infructescence; perianth about 14 mm. long; fruits nearly 2 cm. diam.; tall tree [7. arborea](#)
- Leaves 2-3 cm. broad; not sheathing at base: **10**
- 10** Perianth 11 mm. long; anthers 2 mm. long; S.Nigeria [8. manni](#)
- Perianth 25-30 mm. long; anthers 3.5 mm. long; fruit at least 2 cm. diam.; widespread [9. perrottetii](#)
- 11** Inflorescence very slender terminal panicle, about 25 cm. long, well branched, smooth; fruiting "pegs" 15-20 mm. long, slender; fruit about 1.5 cm. diam. [10. scoparia](#)
- Inflorescence stouter, paniculate or simple, fruiting "pegs" up to 5 mm. long: **12**
- 12** Rhachis of inflorescence aculeolate; bracts 5 cm. or more long, broadly lanceolate, acute; dense clusters of flowers several cm. apart; flowers subtended by numerous lanceolate bracteoles about 1 cm. long; perianth 3 cm. long; leaves oblanceolate, up to 70 cm. long and 10 cm. broad, sheathing at base [11. adamii](#)
- Rhachis of inflorescence smooth; perianth 1.3-3 cm. long: **13**
- 13** Inflorescence spicate, terminal or axillary: **14**
- Inflorescence terminal, paniculate, with short stout branches or more or less simple and with large spherical clusters of flowers: **15**
- 14** Inflorescence a dense continuous terminal spike furnished with long leafy bracts, the lowest bract about as long as the spike; perianth about 3 cm. long; leaves linear-oblanceolate, contracted towards the expanded base, up to 40 cm. long and 3 cm. broad, with numerous transverse nerves arcuately spreading from the midrib [12. talbotii](#)
- Inflorescence terminal and/or axillary spike of few-flowered clusters subtended by rather short ovate inconspicuous bracts; perianth nearly 2 cm. long, slender; leaves broadly linear, very acute, sheathing and amplexicaul at the base, about 20 cm. long, 1.2-3.9 cm. broad, 8-10-nerved on each side of midrib [13. viridiflora](#)
- 15** Leaves acute and mucronate at the apex, lamina oblanceolate, 20-60 cm. long, 5-14 cm. broad, tufted at the end of the shoot, sheathing at the base, nerves about 1 mm. apart; inflorescence usually with many short branches and numerous clusters of flowers; bracteoles deciduous after flowering; perianth 1.5-2 cm. long; lowland shrub [14. fragrans](#)
- Leaves attenuate and subulate-mucronate at the apex, lamina linear-lanceolate, 15-30 cm. long, 1.5-3 cm. broad, slightly narrowed towards the base and expanded into a clasping sheath 1 cm. long along the stem; inflorescence simple or with a few short branches and dense clusters of flowers; bracteoles persistent after flowering, conspicuous, 2 mm. long, scarious; perianth about 1.3 cm. long; montane shrub [15. deisteliana](#)
- 16** Flowers arranged in a lax panicle and not clustered on the axes; pedicels very slender, jointed at the top, about 1.5 cm. long; perianth about 1 cm. long in bud; leaves elliptic or oblong-elliptic, rather abruptly subulate; acuminate, cuneate at the base, 7-16 cm. long, 3-6 cm. broad, with spaced parallel nerves [16. laxissima](#)
- Flowers arranged in dense spikes or small panicles of clusters: **17**
- 17** Leaves spirally arranged and crowded, with very short internodes; petioles about 8-17 cm. long, winged; lamina obovate to oblanceolate, about 20 cm. long, 5-9 cm. broad, shortly acuminate; inflorescences shortly cylindrical 5-10 cm. long, 5 cm. diam., very dense with numerous flowers and bracts [17. bicolor](#)
- Leaves subverticillate, whorls distant from each other and with numerous scars or leaf sheath between: **18**
- 18** Lamina broadly oblanceolate, gradually narrowed to the base, 12-19 cm. long, (3-) 5 cm. broad, with spaced parallel nerves and very oblique veins; upper stems 2 mm. diam.; inflorescence terminal or subtorminal, reflexed, about 10 cm. long, slightly zigzag, with clusters of flowers sessile or shortly pedunculate on the slender axis; perianth about 2 cm. long; fruits up to 1.5 cm. diam. [18. camerooniana](#)
- Lamina elliptic or oblong-elliptic to broadly elongate-oblanceolate, more or less abruptly narrowed at each end: **19**

- 19** Perianth 3.5 cm. long; inflorescence sessile or subsessile, about 5 cm. long, with crowded flowers; fruits spherical, about 1.5 cm. diam.; upper stems 4 mm. diam.; leaves oblong-elliptic to broadly elongate-oblongate, 15-25 cm. long, 4-8 cm. broad, with spaced nerves [19. ovata](#)
- Perianth 2 cm. long; fruits less than 1 cm. diam.; upper stems 2 mm. diam.; leaves elliptic, 8-16 cm. long, 3-7 cm. broad, very acutely acuminate, with spaced parallel nerves: **20**
- 20** Inflorescences racemose with numerous flowers towards the apex and small bracteate clusters becoming well spaced in the middle of the axis [20a. surculosa var. surculosa](#)
- Inflorescences capitate on slender peduncles about 10 cm. long [20b. surculosa var. capitata](#)

1. *Dracaena humilis* Bak. in J. Bot. 12: 166 (1874); F.T.A. 7: 444; Chev. Bot. 646.

APD: Synonym of Dracaena aubryana Brongn. ex E. Morren

Dracaena poggei of Chev. Bot. 647, not of Engl.

Pleomele humilis (Bak.) N. E. Br. (1914).

A herb with imbricated leaf bases on a very short stem and an inflorescence about 1 ft. high, shorter than the leaves; flowers small and green; fruits greenish yellow or red; **in forest**.

Guin.: Foot of Nimba Mt. Schnell 557! **S. L.:** Bagroo R. Mann 898! Roruks (July) Deighton 3264! Kenema F.R. (Mar.) Deighton 4121! **Lib.:** Dukwia R., Grand Cape Mount Dist. (fr. Feb.) Cooper 168! 4. *Dracaena phrynioides* Hook. in Bot. Mag. t. 5352 (1862); F.T.A. 7: 447; Chev. Bot. 647. *APD acc*

Pleomele phrynioides (Hook.) N. E. Br. (1914).

Dracaena humilis of F.W.T.A., ed. 1, 2: 384, partly (Irvine 491, Johnson 763), not of Bak.

A herb with a short tough stem rooting at the base, roots smelling of violets, leaves with pale mottling; fruits red; interest.

Lib.: Kitoma, Sanokwele Dist. (fr. Mar.) Adam 16705! **Iv. C.:** Guidéko to R. Zozro (fr. June) Chev. 19048! Mt. Bô, Danané (fr. Sept.) Nozerau! **Ghana:** E. Akim (fr. June) Johnson 763! Blanka, Ashanti Irvine 491! **S. Nig.:** Oshugoko to Oke Ibode (fr. Mar.) Millson! Oban Richards 5202! **F. Po:** Mann 417!

Also in **E. Cameroun**.

5. *Dracaena goldieana* Bull Cat. 1871: viii; Baker in J. Linn. Soc. 14: 535; F.T.A. 7: 449; Bot. Mag. t. 6630. *APD acc*

Pleomele goldieana (Bull) N. E. Br. (1914).

Herb about 1 ft. high, the leaves very ornamental with transverse bars of dark green and silver grey; flowers white in a sessile terminal head.

S. Nig.: Uwet, Cross R. (Dec.) Holland 195! Calabar (cult. Kew) Goldie!

6. *Dracaena smithii* Bak. ex Hook. f. in Bot. Mag. t. 6169 (1875); F.T.A. 7: 440; Morton, W. Aft. Lilies & Orch. fig. 21; Aké Assi, Contrib. 2: 27 [235].

APD: *Synonym of Dracaena congoensis* Hua

APD: *Synonym of Dracaena fragrans* (L.) Ker Gawl.

Pleomele smithii (Bak. ex Hook. f.) N. E. Br. (1914).

Dracaena fragrans of Chev. Bot. 646, partly (Guin. specs.), not of (Linn.) Ker-Gawl.

A shrub used for hedges or developing into a tree up to 30 ft. high, branched at the base and above, bearing near the top a large crown of leaves several feet long; inflorescence a panicle about 2 ft. long, arising amongst the leaves, flowers yellowish green or white tinged red, opening at night, very fragrant; in drier forest.

Guin.: Labé Chev. 12391! Mamou to Kindia Chev. 13587. Longuery (Dec.) Caille in Hb. Chev. 14784! **S. L.:** Bathurst (Jan.) Dalz. 8254! York (cult., Jan.) Deighton 4586! Freetown (cult.) Deighton 2452! **Ghana:** Ankaful, Cape Coast (Feb.) Hall 1826! Tano-Ofin F.R. (Feb.) Lyon. FH 2873! Adamsu (Dec.) Vigne FH 3500! **Togo Rep.:** Kersting A366

[Another species used as a hedge plant in Sierra Leone has shorter leaves than either *D. smithii* or *D. arborea* and it may be *D. fragrans* (q.v.). It has an unbranched weak trunk up to 15 ft. high and, according to notes with Deighton 4616, it has not been seen to flower.]

7. *Dracaena arborea* (Willd.) Link Enum. Hort. Berol. 1: 341(1821); F.T.A. 7: 439; Keay, Onochie & Stanfield, Nig. Trees 2: 440 (1964). *APD acc*

Aletris arborea Willd. (1809).

Pleomele arborea (Willd.) N. E. Br. (1914).

Palm-like tree 30-45 ft. high, with several branches, leaves aggregated near branch ends; flowers creamy white in large shortly branched pendulous inflorescences 3-4 ft. long; fruits orange to red; often planted as a fence or ornamental tree, otherwise in upland forest often near streams.

S. L.: Regent (Nov.) Morton SL 122! Konnoh country Burbridge 483! Panguma (fr. Feb.) Deighton 4001! Tingi Mts. (Dec.) Marten & Gledhill 3022! **Lib.:** Paynesville, 'common' (Aug.) [Although most herbarium material named as *D. mannii* probably belongs to this species, only specimens bearing flowers have been cited above—see Hepper in Kew Bull. 22: 451, fig. 3 (1968).]

10. **Dracaena scoparia** A. Chev. ex Hutch. in Kew Bull. 1939: 247; Chev. Bot. 647.

APD: Synonym of Dracaena cerasifera Hua

A shrub 10-15 ft. high; slender panicle of white flowers, very fragrant; fruits red; **in forest**.

Iv. C.: Erymacougnié (Jan.) Chev. 16967! Alépé (fr. Feb.) Chev. 17484! Yapo forest (Oct.) de Wilde 3141! Tienkula (fr. Feb.) Bernardi 8294! **Ghana:** Irvine 1097! Axim (fr. Feb.) Irvine 2181! Tarkwa (Feb.) Kinloch FH 3230!

11. **Dracaena adamii** Hepper in Kew Bull. 22: 449, figs. 1 & 2 (1968). *APD acc*

APD: Synonym of Dracaena calocephala Bos

Dracaena densifolia Bak., partly (Mann [8] from F.Po).

Apparently a shrub; **in forest**.

Lib.: Nimba reserve, 2,100 ft. (June) Adam 21103! 21220! 21367! 21512! **Ghana:** Ankasa F.R. (Jan.) Enti & Hall GC 36297! **F. Po:** Mann 8! (Also specimen cult. in Berg-Garten, Herrenhausen from same collection.)

12. **Dracaena talbotii** Rendle in Cat. Talb. 112 (1913). *APD acc*

Pleomele talbotii (Rendle) N. E. Br. (1914).

Remarkable for its elongated sharply acuminate leaves and dense spikes with large bracts.

S. Nig.: Oban Talbot 1532!

13. **Dracaena viridiflora** Engl. & K. Krause in Engl., Bot. Jahrb. 45: 153 (1910); Hepper in Kew Bull. 21: 491 (1968).

APD: Synonym of Dracaena mildbraedii K. Krause

Dracaena vaginata Hutch. in F.W.T.A., ed. 1, 2: (1936), English descr. only.

Dracaena mannii of F.W.T.A., ed. 1, 2: 384, partly (Mildbr. 10571; Talbot 729), not of Bak.

A shrub with long slender branches and leaves sheathing at the base; lateral inflorescences about 4 in. long.

S. Nig.: Oban Talbot 729! Obudu Plateau, 5,000 ft. (Nov.) Tuley 1042! **W. Cam.:** Likomba, Victoria (Oct.) Mildbr. 10571!

Also in **E. Cameroun**.

14. **Dracaena fragrans** (Linn.) Ker-Gawl. in Bot. Mag. 1081 (1808). *APD acc*

APD: Synonym of Dracaena congoensis Hua

Aletris fragrans Linn. (1762).

Pleomele fragrans (Linn.) Salisb. (1796).

Shrub about 5 ft. high; flowers white with pink lines, very fragrant; **in drier lowland forest**.

Ghana: Aburi Hills (Mar.) Johnson 730! Tano-Ofin F.R. (Feb.) Lyon FH 2873! **S. Nig.:** Ubulubu (Feb.) Thomas 2305! Oban Talbot 1412! Aking, Mamfe to Calabar (Feb.) Onyeachusim & Latilo FHI 54003!

Extending to E. Africa.

[The distinction between *D. fragrans* and *D. smithii* is not entirely clear and further study of both herbarium and living material is desirable.-F.N.H.]

15. *Dracaena deisteliana* Engl. Bot. Jahrb. 32: 96 (1902).

APD: Synonym of Dracaena fragrans (L.) Ker Gawl.

Dracaena fragrans of F.W.T.A., ed. 1, 2: 384, partly (Dalz. 8348, Lehmbach 16), not of (Linn.) Ker-Gawl.

Shrub of upland forest above 4,000 ft. and commonly planted as a hedge, with several stems 8 or 9 ft. high; flowers white with pink lines.

W. Cam.: Buea, 4,000-5,000 ft. (Feb.) Maitland 357! Lehmbach 16. Cam. Mt., 5,000-6,000 ft. (Jan.- Mar.) Dalz. 8348! Dundas FHI 20374! Breteler et al. MC 178! Maitland 1328! Bambui, Bamenda (Feb.) Brunt 965!

Also in **E. Cameroun**.

[Plants from Jos Plateau, N. Nigeria (W. D. MacGregor 437, McClintock 202) have acute leaves and larger flowers like *D. fragrans*, but bracteoles as in *D. deisteliana*.]

16. *Dracaena laxissima* Engl. Bot. Jahrb. 15: 478 (1892); F.T.A. 7: 446. *APD acc*

***Dracaena elegans* Hua** (1898)-F.T.A. 7: 446.

***Pleomele laxissima* (Engl.) N. E. Br.** (1914).

***P. elegans* (Hua) N. E. Br.** (1914).

Slender shrub with a slender lax pendulous panicle.

S. Nig.: Ikpoba (June) Farquhar 13! **W. Cam.:** Su, Bamenda, 3,500 ft. (fr. May) Maitland 1686!

Also in **E. Cameroun, Rio Muni, S. Tomé, the Congos, Sudan, E. Africa, Zambia** and **Malawi**.

17. *Dracaena bicolor* Hook. in Bot. Mag. t. 5248 (1861); F.T.A. 7: 448; Hepper in Kew Bull. 22: 450 (1968). *APD acc*

***Dracaena cylindrica* Hook. f.** in Bot. Mag. t. 5848 (1870); F.T.A. 7: 448.

PALMAE

Stems stout or slender, sometimes climbing, sometimes very short or almost nothing, often covered by the persistent bases of the leaves; primary root soon disappearing and replaced by roots from the base of the stem. Leaves in a terminal cluster or in the climbing species scattered, sometimes very large, entire, pinnately or digitately divided, the segments or leaflets folded induplicate or reduplicate in bud, often sharp at the apex and prickly on the margins or midrib; rhachis often expanded at the base into a fibrous sheath. Flowers small, actinomorphic, bisexual, monoecious or dioecious, sometimes polygamous, arranged in an often paniculate inflorescence (spadix) either amongst or below the leaves. Spathes various, sometimes numerous and enclosing the peduncle and branches of the inflorescence, or few, leathery or membranous; bracteoles often connate below the flowers. Perianth double. Sepals 3, separate or connate, imbricate or open in bud. Petals 3, separate or connate, usually valvate in the male flowers and imbricate in the female. Stamens usually 6, in two series, rarely numerous; anthers 2-locular, loculi globose to linear, opening by slits lengthwise; pollen smooth or rarely echinulate. Ovary superior, rudimentary or absent in the male flowers, 1-3 locular, rarely 4-7 locular, or carpels 3 and distinct or connate only at the base; ovule solitary and erect or pendulous from the inner angle of each carpel or loculus of the ovary. Fruit a berry or drupe, 1-2-locular, or fruiting carpels distinct; exocarp often fibrous, sometimes covered by reflexed scales. Seeds free or adherent to the endocarp; endosperm present, sometimes ruminant; embryo small.

Tropics and warm temperate regions.

1. PODOCOCCUS

Mann & Wendl. in Trans. Linn. Soc. 24: 426 (1864); F.T.A. 8: 99.

- 1** Leaves 6-9 in number, up to 2 m. long, pinnatisect; petiole 30-45 cm. long; leaf-segments 8-10, rhomboid-oblongate or fan-shaped, with many radiating nerves, the lower margins straight, the upper dentate; male spadix simple, pedunculate, the floriferous part about 30 cm. long, spike-like; male flowers many, commonly paired and sessile in pits of the spadix, stamens 6; female spadix similar with many flowers, usually solitary in pits of the spadix, the oblong ovary with 3 short recurved stigmas; fruit baccate, orange-red, oblong-cylindrical, 2.5 cm. long, 0.6 cm. wide [barteri](#)

Podococcus barteri *Mann & Wendl.* l.c. tt. 38, 40, 43 (1864); F.T.A. 8: 100. *APD acc*

A slender elegant palm of the [forest floor](#) with reed-like annulate stem 6-9 ft. high, covered in many of its parts with a rusty scurf.

3. ELAEIS

Jacq., Select. Stirp. Am. Hist. 280 (1763); F.T.A. 8: 124.

- 1** Leaves many, in a terminal crown, up to 5 m. long, arching, pinnate; petiole short, thick, commonly spiny at margins; segments in 4 ranks, ensiform, acuminate, glabrous, the lowest spinescent; spadices interfoliaceous, the male pedunculate with many, crowded, short, lateral floriferous branches, 10-15 cm. long, ending in a sharp hard point; male flowers densely crowded, minute, with linear sepals, linear-oblong petals, and 6 stamens; female spadix with short peduncle and branches congested into a globose capitulum, the bracts rigid, acuminate; female flowers much larger than the male, with ovoid ovary and relatively large revolute stigmas; fruit ovoid or somewhat angular, often bright red and shining black when ripe; pericarp spongy and oily, fibrous inside; endocarp hard and often thick, enclosing the adnate seed [guineensis](#)

Elaeis guineensis* Jacq. l.c. t. 172 (1763); F.T.A. 8: 125. *APD acc

The African Oil Palm, easily recognizable by its arching, dark-green leaves and straight trunk clothed when young with petiole-bases, is **cultivated and occurs spontaneously in much of the forest zone from Senegal to Cameroun, being particularly abundant near habitations, in land which has been tilled, and in river valleys**. Several forms, differing in structure and colour of the fruit, are described in Kew Bull. 1909: 33 and 1914: 285, and in Holland 4: 734.

Cultivated in other parts of the humid tropics.

A form occasionally seen, differing in vegetative characters, is the King Palm (*E. guineensis* var. *idolatrix* A. Chev.) with fronds held at an acute angle and leaf-segments remaining fused for the greater part.

4. COCOS

Linn., Sp. Pl. 1188 (1753); F.T.A. 8: 126.

- 1 Leaves pinnate, light-green, in a cluster at the top of the stem; petiole slightly sheathing, unarmed; segments almost equidistant, in 2 ranks, linear-lanceolate, mid-vein thick, yellowish; spadix 1 m. long or more, simply paniced, branches bearing usually few female flowers towards the base and many male flowers throughout their length; male flowers asymmetrical, small, with valvate sepals and petals; female flowers larger, 2.5 cm. long, globose, supported by broad bracteoles; fruit 20-30 cm. long, trigonously ovoid or globose, green or yellowish[nucifera](#)

Cocos nucifera* Linn. l.c. (1753); F.T.A. 8: 126. *APD acc

The Coconut, distinguished by its smooth, rather slender trunk which is seldom straight, its crown of pinnate leaves, and its well-known fruit

It is cultivated and grows chiefly in coastal areas from Senegal to Cameroun. Cultivated in similar situations throughout the tropics.

5. RAPHIA

P.Beauv., Fl. Oware 1: 75 (1806); F.T.A. 8: 104; Russell in Kew Bull. 19: 173-196 (1965).

- 1 Spadices curved, branching to form numerous hanging partial inflorescences:**2**
 Spadix central, forming a large erect panicle, the partial inflorescences arching, strongly compressed, with distichous spikes bearing rather similar male and female flowers; calyx extending beyond the bracteole, deeply and acutely tridentate; corolla segments lanceolate, slightly falcate, sharply pointed; stamens of male flowers 6, filaments free to the base; female flower with conspicuous inner bracteole, extended on one side in a triangular point, staminodes 6, borne on the mid part of the corolla; fruit obovoid or fusiform, tapering towards both ends, up to 7.5 cm. long, 3.5 cm. at greatest breadth, the beak 5 mm. long, broadly based but narrowing to a fine point; scales in 9 vertical rows, flattish or slightly convex, with faint shallow furrow and chaffy fringe, dark mahogany, shining[6. regalis](#)
- 2 Partial inflorescences short, solid, with conspicuous papery bracts from which protrude very short ultimate branchlets; fronds tall, erect, stiff, glaucous-green, segments thickly armed on margins and midvein with fine blackish spines; male flowers with calyx entire, lobed; stamens 10-12, filaments fused for half their length; fruit top-shaped, about 8 cm. long, 4.5 cm. wide, mahogany-red, shining, with stout blunt beak about 8 mm. long, and 9 or 10 vertical rows of rather flat or slightly convex scales with shallow furrow[4. sudanica](#)
- Partial inflorescence not thick and solid; the ultimate branchlets distinct, free, and spreading:**3**
- 3 Ultimate branchlets in mature partial inflorescence crowded in close ranks, more or less in one plane:**4**
 Ultimate branchlets in mature partial inflorescence lax, spreading on all sides:**5**
- 4 Bract at base of partial inflorescence small, the exposed partial inflorescence roughly racquet-shaped, with stout, coarse, crowded branchlets; upper part of trunk clothed with a mass of black fibres; fronds tall, dark green shining above; corolla segments distinctly thickened near the tip; male flower with (15-) 18-22 (-24) stamens; female flower with 12-15 narrowly sagittate staminodial points; fruit top-shaped or ellipsoid, variable in size from 6-12 cm. long, 4-5 cm. wide, with stout beak 1-1.5 cm. long, more or less obliquely tipped, and (11-) 12 (-14) vertical rows of scales, convex, slightly less broad than long, lightly and narrowly furrowed, chestnut-coloured, or cinnamon with darker point[2. hookeri](#)

Bract at base large, triangular, persistent, partly concealing the short partial inflorescence which has slender, light brown, polished branchlets; fronds tall, rising in a cluster from ground-level, or from a very short stem, dark green above, the segments armed on mid-vein and margins with many fine brown spines; male flowers with cup-shaped calyx, scarcely lobed; corolla with basal quarter fused with the filaments to form a solid column, the upper portion splitting into 3 narrow pointed segments scarcely thickened at the tip; stamens 6, the filaments thick, angular, joined for most of their length; female flowers numerous, much smaller than the male, with calyx slightly lobed enclosing the shorter sharply tridentate corolla; staminodes 6-9 with deltoid points; fruit top-shaped, 5.5-8.5 cm. long, 3.5 cm. wide, with rounded top ending abruptly in a fine beak 3-4 mm. long; scales in (9-) 10-11 (-12) vertical rows, convex with narrow median groove, chestnut or hazel, darker towards the point [5. *farinifera*](#)

- 5 Ultimate branchlets slender, tapering, flattened, with flowers superficially in 2 rows; fronds long, arching, with stout rhachis; male flower curved, calyx shortly tridentate, corolla segments little thickened at tip, with sharp, pricking point, stamens (6-) 9, filaments free for the greater part; female flower with usually 9 deltoid staminodes; fruit cylindrical-ellipsoid, 6.5-9 cm. long, 3.5-4 cm. wide, ending abruptly in a sharp beak 3-5 mm. long; scales in (8-) 9 vertical rows, rhomboidal, as broad as long, flat or slightly concave towards the point, with broad groove, hazel-brown or chestnut with darker margin, and membranous point lighter in colour [1. *vinifera*](#)

Ultimate branchlets not flattened but rounded, rather knobby, with flowers obviously in 4 ranks; fronds light green, not shining; male flowers with calyx distinctly segmented, sepals separated for about one-third of their length, rather sharply dentate, stamens usually 9-12, free to the base; fruit elongate-ovoid, tapering towards the tip, 8-9.5 cm. long, 4 cm. wide, the beak narrow, sharp, about 5 mm. long, scales in 8 or 9 vertical rows, bigibbous, with deep furrows running the length of the fruit [3. *palma-pinus*](#)

Raphia monbuttorum of Rendle, Cat. Talb. 149.

Stem short and stout clothed with leaf-bases, the fronds tall with many segments (according to Beccari); the form of its spadix, and, in particular, the zigzag arrangement of flowers on the distichous spike, render it distinctive from other species; in Gabon and Angola it is said to grow not in swamps but on forested slopes.

S. Nig.: Obani Talbot 948!

Also in Gabon and Angola.

[This palm is represented from W. Africa by a single incomplete gathering in the British Museum.]

Imperfectly known species.

Raphia humilis A. Chev. in Rev. Bot. Appliq. 12: 204 (1932).

*APD: Synonym of *Raphia sudanica* A. Chev.*

The only herbarium specimen seen is a portion of leaf in the Paris Museum. Chevalier describes this as a palm forming no trunk or suckers, with short, very spiny leaves up to 3.5 m. long, bearing 60 pairs of segments. The short spadix is almost as broad as long, and the branches bear crowded spikes. Male flowers are large, up to 2.4 cm. in length, with 10-12 stamens, the filaments united for most of their length. The fruit, 4.5-7 cm. long and 2.5 cm. wide, has a large beak 1 cm. long, and scales in 10 (9-12) rows. **It was found by watercourses in savanna country.**

Dah.: Agouagon and Savé fide Chev. l.c.

6. CALAMUS

Linn., Sp. Pl. 325 (1753); F.T.A. 8: 107; Beccari in Ann. Roy. Bot. Gard. Calcutta 11: 73 (1908).

- 1 Sheathed stem 1.8-2.5 cm. diam., seldom straight; leaf-sheath often thickly armed with straight spines and sometimes bearing a spiny lateral flagellum; ochrea similarly spiny, 4-5 cm. long, marcescent; leaves distant from each other, about 1 m. long; segments rather numerous, linear-lanceolate, up to 30 cm. long, 2.5 cm. broad, with fine subulate spines on margin and often on lower surface; rhachis, with sharp recurved hooks, not ending in a cirrus; spadix long, slender, tapering to a fine flagellum armed with recurved thorns, with partial inflorescences few, strict, bearing floriferous branchlets about 5 cm. long; flowers solitary in male spadix, paired in the fruiting spadix, a female flower with a male or neuter in the same bracteole; bracteoles obliquely truncate; fruit oblong-ellipsoid, pointed, about 1.5 cm. long, with 16-21 vertical rows of triangular-ovate, fimbriate scales[deërratus](#)

7. ANCISTROPHYLLUM

(Mann & Wendl.) Mann & Wendl. in Kerch., Pahn. 230 (1878); F.T.A. 8: 113. *APD acc*

- 1 Leaf-segments numerous, almost equidistant on the rhachis, elongate, linear-lanceolate sometimes sigmoid, variable in length up to 60 cm., commonly about 30 cm. long, 2-3 cm. broad, with numerous fine spines on the margin, often with 1 prominent vein (but sometimes 2, or as many as 5) ciliate-spinose on the upper surface; rhachis without pinnae near the base where it bears many long straight spines, usually prolonged above into a stout unarmed cirrus, triangular in section, bearing several pairs of sharply triangular hooks thickened at the base; spadix forming a large terminal panicle of many branches up to 50 cm. long, bearing numerous many-flowered branch-lets about 25 cm. in length; bracts imbricate, pointed, glabrous; bracteoles cupular, truncate, 4 mm. long; flowers 1-1.2 cm. long, 3 mm. broad, slightly curved, narrowed to a rather obtuse tip; calyx

campanulate 4 mm. long; fruit broadly ellipsoid, sharply mucronate, 1.5-1.8 cm. long, 1-1.2 cm. across, with 15-18 vertical rows of closely-packed, rhomboid-ovate, shining scales; seed smooth, flat on one side[1. secundiflorum](#)

Leaf-segments mostly broad, sigmoid, often inequidistant or in irregular clusters on the rhachis:[2](#)

- 2** Leaves tomentose at first; sheath tubular 30 cm. long, usually armed towards the top with crowded spines on laterally-flattened bases, extending into an ochrea 15-30 cm. long bearing similar spines; rhachis thickly armed with recurved spines throughout, usually produced into a fine cirrus bearing 4-6 pairs of hooks; segments lanceolate-sigmoid, marcescent, the longer 20-30 cm. long, 2 1/2-10 cm. broad, opaque, slightly rough, firm when dry; with 1-4 (seldom 5) main nerves more or less prominent the, margin commonly with fine spinules; spadix terminal up to 60 cm. long with 5 or 6 primary branches bearing many-flowered branchlets 10-20 cm. long, slender, pendulous; bracts acuminate, bracteoles 2-horned, the points distinct and firm; flowers paired, divergent, fusiform; calyx campanulate with lobes 4 mm. long, ovate, acuminate; corolla twice as long, lobes elliptic-lanceolate; fruit red when fresh, globose 1.5 cm. diam., with scales in 12 vertical rows; seed subglobose warty, deeply grooved on one side[2. opacum](#)

Like the preceding in many respects; the rhachis, which is usually produced into a cirrus and is armed throughout with recurved spines, has a rather persistent tomentum; leaf-segments sigmoid, gradually acuminate with a long fine point, smooth, shining on both surfaces, papery when dry, commonly, though not invariably, with 2 prominent main veins, margins unarmed; fruits sub-globose up to 1.5 cm. in length with 18 vertical rows of very small fimbriate scales; seed smooth, flattened on one side[3. laeve](#)

1. *Ancistrophyllum secundiflorum* (P. Beauv.) Wendl. in Kerch., Palm. 230 (1878); F.T.A. 8: 115; Chev. Bot. 675.

*APD: Synonym of *Laccosperma secundiflorum* (P. Beauv.) Kuntze*

Calamus secundiflorus P. Beauv., Fl. Oware 1: 15, t. 9-10.

A large rattan, **common in many areas of wet forest**, with rather smooth stems, 100 ft. or more in length, scrambling over trees, and with handsome clusters of red fruits.

Port. G.: Cacine d'Orey 262! **Guin.:** Ditinn Chev. 12630. Farana Chev. 13421. Irié Roberty! **S. L.:** Kwaoma, Tunkia (fr. Mar.) Deighton 4119! Gorahun (fr. May) Jordan. 2064! 2065! Tabe (Sept.) 8. ONCOCALAMUS

(*Mann & Wendl.*) *Hook f.* in Benth. & Hook. f. Gen. Pl. 3: 881, 936 (1883); F.T.A. 8: 110.

- 1** Leaf-segments, usually about 16 on each side of the rhachis, linear-lanceolate, acute, or slightly falcate, up to 25 cm. long, 1.75-2 cm. across, rather stiff, with a prominent mid-rib; rhachis, leafy to the base without stout, hooked prickles, and extended above into a slender cirrus furnished with reflexed hooks; leaf-sheath with flattened spines, which are caducous, leaving a scar oblique to the axis; ochrea truncate 2-3 cm. long; flowers in groups, a female with male on each side; fruit unknown [1. mannii](#)

Leaf-segments few, usually 5-7 on each side of the rhachia, broadly lanceolate or sigmoid, 10-15 cm. long, 2.5-5 cm. broad, thin, papery, the broader with 2 or more prominent veins; rhachis leafy almost to the base, where are a few stout hooked prickles on the margin, and extended upwards into a cirrus as in the previous species; leaf-sheath and ochrea as above; flowers unknown; fruits light-yellow [2. wrightianus](#)

- 1. *Oncocalamus mannii* (Wendl.) Wendl.** in Kerch., Palm. 252. Calamus (*Oncocalamus*) *mannii* Wendl. in Trans. Linn. Soc. 24: 436, tt. 41, 43 (1864). *APD acc*

A slender-stemmed rattan of **swampy forest**, climbing to 60 ft.

S. Nig.: Calabar, Ikot Okpora Tuley 1078!

Also in **Gabon**.

- 2. *Oncocalamus wrightianus* Hutch.** in Kew Bull. 17: 181 (1963). *O. mannii* of F.T.A. 8: 111 partly, not of (Wendl.) Wendl. *APD acc*

A slender climbing palm of **secondary forest**, probably not uncommon in S. Nigeria but inadequately recognized and collected.

S. Nig.: Lagos I. Barter 2220! Ebute Metta Millen 18! Sunmoge, Ijebu Janes & Onochie FHI 17419!

9. EREMOSPATA

(*Mann & Wendl.*) *Mann & Wendl.* in Kerch., Palm. 244 (1878); F.T.A. 8: 111.

- 1** Leaf-segments less than 5 times longer than broad: **2**

Leaf-segments more than 5 times longer than broad, usually narrow, 15-35 cm. long, 2-3 cm. broad, pointed at each end, with many prominent parallel nerves and numerous sharp subulate teeth on the margin; rhachis prolonged into a cirrus with opposite hooks but not armed with prickles; spadix with very few short lateral branches; flowers crowded, paired, sessile; calyx campanulate, sub-truncate, striate 4-5 mm. long; fruit oblong-ellipsoid, 3 cm. long, mucronate, with 18-22 vertical rows of thin closely-packed rhomboid scales [3. macrocarpa](#)

- 2** Segments of leaves obovate, oblanceolate, or almost rhomboid but with side of the cuneate portion more or less rounded, with several sharp teeth on the margin; median nerve having on each side about 5 prominent veins nearly parallel; transverse veinlets irregular, not very close, crooked; rhachis produced into a slender cirrus armed with opposite hooks and usually with many black recurved prickles; spadix with several branches, slightly scabrid, branches with very short nodes; fruit ovoid-cylindrical with rounded apex, about 2.5 cm. long, 1.7 cm. wide, with 20-21 vertical rows of rhomboid scales, and with persistent perianth at the base, the inner segments short, 0.3 cm. long, minutely papillose on the outer side, dark-brown; seeds 1 or 2, peltate, ellipsoid, 2 cm. long, 1.2 cm. broad, 6 mm. thick [1. hookeri](#)

Segments of leaves rhomboid or fan-shaped, the sides of the cuneate portion straight, the apex ovate-triangular, toothed, with several or many conspicuous straight veins radiating fan-wise from the base; transverse veinlets very crowded, nearly parallel and straight; rhachis prolonged into a cirrus with opposite hooks and armed with recurved prickles; fruit cylindrical, 2.3 cm. long, 1.3 cm. wide, terminating abruptly in a flat top bearing in the centre a conspicuous umbo, with scales small, rhomboid, in 19-20 vertical rows, and with persistent perianth at

the base, the broad inner segments 6 mm. long, with pronounced thickening in the lower half; seeds up to 3, ovate, rather flat, 1·8 cm. long, 8 mm. broad, 3 mm. thick [2. wendlandiana](#)

1. *Eremospatha hookeri* (Mann & Wendl.) Wendl. in Kerch., Palm. 244 (1878); F.T.A. 8: 112, partly. *APD acc*

Calamus hookeri Mann & Wendl. in Trans. Linn. Soc. 24: 434, t. 41 (1864).

A climbing palm up to 100 ft. high; in forest.

10. BORASSUS

Linn., Sp. Pl. 1187 (1753); F.T.A. 8: 117.

- 1** Leaves flabellate; lamina divided less than halfway into broad and relatively short segments, bifid at the tip, transverse veinlets prominent giving the lower surface in dried material a corrugated appearance; petiole concave on upper surface, the margins flanged, thin, dark-brown, with irregular spine-like excrescences; male spadix branched from the base, branches poker-like, flowering part about 30 cm. long, 3 cm. across, male flowers several and densely packed within each bracteole; female spadix dissimilar, with few large flowers; fruit ovoid or globose with fibrous pericarp, enclosing usually 3 ovoid-compressed pyrenes; albumen homy, hollow [aethiopum](#)

***Borassus aethiopum* Mart.** Münch. Gel. Anzeig. 639 (1838), 46 (1839), and in Hist. Nat. Palm. 3: 220, tt. 108, 121, 162; Beccari in Webbia 4: 325 (1914), and in Palme Borass. 8 (1924). *APD acc*

Borassus flabellifer var. *aethiopum* (Mart.) Warb. in Engl., Pfl. Ost. Afr. B: 20, C: 130 (1895); F.T.A. 8: 117.

The tallest of African palms, often 70 ft. high and sometimes as much as 100 ft., with trunk swollen above the middle; in dry savanna. The palm is dioecious, the female conspicuous by its large orange fruits.

Sen.: Brunner! **Iv. C.:** Assinie Chev. 16312! Béréby Oldeman 625! **Ghana:** Ejura, Ashanti Chipp 773! **N. Nig.:** Nupe Barter 792!

Widely distributed in tropical Africa.

11. HYPHAENE

Gaertn., Fruct. 1: 28 (1788); F.T.A. 8: 118.

- 1 Leaves flabellate, segments divided for more than half their length, petiole armed on the margins with black hooks upwardly curved; male spadix with several spiciform flowering branches about 20 cm. long, 1 cm. diam.; male flowers in groups of three, each group sunk in a pit enclosed by a ribbed bracteole, from which one flower at a time projects at anthesis; branches of female spadix of similar length but stouter, covered in the fruiting stage by dense tomentose cushions; fruit globose-quadrangular, sometimes irregularly gibbous, about 6 cm. long, 5 cm. broad, with shiny brown coat, fibrous pericarp, and woody endocarp to which the single seed is adnate; seed with white albumen, hollow [thebaica](#)

Hyphaene thebaica (Linn.) Mart. Hist. Nat. Palm. 3: 226, tt. 131-3 (1839); F.T.A. 8: 120; Beccari in Agric. Col. 2: 162 (1908), and in Palme Borass. 23 (1924); Chev. Bot. 676; Chev. & Dubois in Rev. Bot. Appliq. 18: 93 (1938). *APD acc*

Corypha thebaica Linn., Sp. Pl. 1187 (1753).

A dioecious palm of **hot dry localities**, easily recognized by its common, though not invariable, habit of branching.

Although poorly represented in herbarium collections, the Dum palm is widely distributed from Senegal and Gambia to N. Nigeria chiefly between 12° and 18°N., and is abundant in many areas including the Upper Niger (fide Chevalier & Dubois l.c.), the Northern Region of Ghana (Irvine), and Bornu (Drude). It extends through C. African Republic to **Egypt**, Somali and **Arabia**.

[Further study may show other species to occur in W. Africa. Beccari (Palme Borass.) gives two variants, *H. dahomeensis* Becc. and *H. togoensis* Dummer, and Thonning's *H. guineensis* may be in this region. For lack of adequate herbarium material it has not been possible to ascertain how steadfastly these differ from *H. thebaica* or what is their range. Until the situation is made plain it is considered preferable to refer all to *H. thebaica* (Linn.) Mart.-T.A.R.]

12. PHOENIX

Linn., Sp. Pl. 1188 (1753); F.T.A. 8: 102.

- 1 Fruit fleshy, ellipsoid, 3-5 cm. long, with thick sweet pericarp; fronds 3-6 m. long, glaucous; segments lanceolate-linear, stiff; plants dioecious, male flowers rounded at the tip [1. dactylifera](#)
- Fruit dry, oblong-ellipsoid, about 2 cm. long, with thin pericarp; fronds typically arched, shining green; segments many, the lower spinescent, the remainder with sharp tip, or sometimes bifid; flowers dioecious; male spadix with many flexuous branches, flowers lanceolate, acute; female spadix with lower branches subverticillate others spirally arranged, corolla cup-shaped persistent, calyx barely half as long, with mucronate sepals; seed about 1.3 cm. long, ovoid, slightly curved, with deep furrow [2. reclinata](#)

1. **Phoenix dactylifera** Linn. l.c. (1753); F.T.A. 8: 102. *APD acc*

The Date palm, with characteristic tall, straight trunk, clothed with rather persistent leaf-bases, and head of stiff fronds, is **not uncommon in the hotter dry parts of the region, being planted for ornament as much as for food**.

2. **Phoenix reclinata** Jacq. Fragm. 1: 27, t. 24 (1801); Beccari in Malesia 3: 349 (1890); F.T.A. 8: 103. *APD acc*

Phoenix spinosa Schum. & Thonn., Beskr. Guin. Pl. 437; Chevalier in Rev. Bot. Appliq. 32: 222 (1952).

A tufted palm, often forming clumps, the stems occasionally as tall as 28 ft. but commonly much less; **in sunny places where there is good moisture for its roots**.

Sen.: (Dec.) Chev. 2598! S. Senegambia Brunner! Farmar! **Gam.:** Bathurst (fr. Mar.) Dawe 70! Brooke 1932! **Port. G.:** Uana-Porto d'Orey 208! Keay FHI 21104! Zaria (fr. Oct.) Cons. of For.! Jos Batten-Poole! Mambila Plateau Hepper 1705! **S. Nig.:** Ibadan Meikle 973! Nun R. Mann 528! Aguku Thomas 342! Bonny (fr. Dec.) Unwin! Obudu Plateau Tuley 52! **W.**

Cam.: Ninong, Kumba Dist. (fr. Mar.) Unwin! Widely distributed in Africa, eastwards to Uganda and Kenya, southwards to the Cape.

[Chevalier (l.c.) affirms that this palm in lowland habitats of W. Africa differs sufficiently from the S. African *P. reclinata* Jacq. to be regarded as a distinct species, for which he uses Schumacher and Thonning's name of *P. spinosa*. He further recognizes two other species, *P. djalensis* and *P. baoulensis*, growing at higher elevations. In the material here examined, I have failed to find consistent characters separating the W. African from *P. reclinata*, and have preferred the earlier opinion of Beccari (l.c.) that the Phoenix occurring naturally in different parts of Africa are of one species, *P. reclinata* Jacq.-T.A.R.]

13. NYPA

Steck, De Sagu 15 (1757).

- 1 Leaves pinnate, erect and recurved, 5-10 m. long, bright green above, glaucous beneath, with many linear-lanceolate segments; spadix terminal, erect in flower, later drooping; male flowers in catkin-like lateral branches, minute, surrounded by setaceous bracteoles; female flowers crowded in a terminal head, much larger; fruit a large globose syncarp of many irregularly hexagonal 1-seeded carpels; pericarp fibrous, endocarp spongy; seed ovoid, about 7 cm. long, 4 cm. wide, grooved on one side[fruticans](#)

Nypa fruticans *Wurmb.* in Verh. Batav. Genootsch. 1: 349 (1779); Martius, Hist. Nat. Palm. 3: 305, t. 208 (1839); Holland in Kew Bull., Add. Ser. 12, 4: 715 (1922). *APD acc*

A prostrate-stemmed, gregarious palm growing in [estuarine conditions similar to mangrove](#).

Introduced from Singapore Botanic Gardens to Calabar in 1906 and Oron in 1912. It has since spread in the estuary of the Cross River and has more recently been transferred to the Niger Delta. Its natural range is from India to Queensland.

PANDANACEAE

Trees or shrubs, trunk and branches often with aerial roots. Leaves in 4 rows or spirally arranged and crowded towards the top of the shoots, linear, sheathing at the base, keeled, mostly spinulose on the margins and keel. Flowers dioecious, paniculate or densely crowded into spadices, the latter axillary and terminal, fasciculate or paniculate, enclosed at first by spathaceous sometimes coloured or leafy bracts. Perianth rudimentary or absent. Male flower: stamens numerous; filaments free or connate; anthers erect, basifixed, 2-celled, the cells sometimes again once divided. Female flower: staminodes absent or small and hypogynous or adnate to the base of the ovary. Ovary superior, 1-celled, free or confluent with adjacent ovaries into bundles with separate or united stigmas; style very short or absent. Ovules solitary to many, basal or parietal. Syncarps oblong to globose; mature carpels woody, drupaceous or baccate, pulpy inside. Seeds minute, with fleshy endosperm and minute embryo.

Tropics and subtropics, especially in oceanic islands.

PANDANUS

Linn. f., Suppl. 64 (1781); F.T.A. 8: 127.

Ovaries with solitary ovules, free or connate into clusters; placentas subbasal; fruit woody or drupaceous; staminodes absent from the female flowers.

- 1 A tree by water up to 10 m. high; leaves broadly linear, gradually narrowed to the apex, up to 1 m. long, 2.5-5 cm. broad, very closely nerved, with numerous upwardly directed sharp teeth on the margin; male inflorescences in the axils of large bracts, the lower bracts with leafy tops, the others thin and serrulate; flowering axes up to 15 cm. long, flowers very numerous; anthers about 2 mm. long; infructescence oblong-ellipsoid, about 16-17 cm. long and 10 cm. diam.; drupes angular at the top and bluntly pointed .[candelabrum](#)

In spite of the additional collections since the first edition no progress has been made in the elucidation of the taxonomy of *Pandanus* in W. Africa. Further collections should show the female inflorescence or fruit, apical and basal portions of a leaf or the whole leaf may be pressed concertina-wise; male inflorescences are only useful when associated, with females growing in the vicinity. Mature fruits may be collected and sectioned longitudinally.

Pandanus utilis Bory

Recorded by Berhaut (Fl. Sén. 187) as being cultivated in Senegal.

Pandanus veitchii Hort.

Recorded by Berhaut (Fl. Sén. 187) as being cultivated in Senegal.

HYPOXIDACEAE

Herbs with a tuberous rhizome or a corm. Leaves mostly all radical, usually prominently nerved and often clothed with long hairs. Flowers solitary, spicate, racemose or subumbellate, mostly white or yellow, actinomorphic. Perianth-tube nothing or very short or consolidated into a long beak on top of the ovary; segments 6, spreading, equal. Stamens 6 or rarely 3, opposite the perianth-segments and inserted at their base; anthers 2-celled, opening lengthwise. Ovary inferior, 3-celled, style short or 3 styles separate. Ovules numerous in 2 series on axile placentas, or rarely few. Fruit a capsule opening by a circular slit or by vertical slits near the top, or indehiscent and fleshy. Seeds small; embryo in abundant endosperm.

Mainly Southern Hemisphere and tropical Asia.

- 1 Ovary immediately below the perianth-segments, the latter free to the base; fruit dehiscent by a circular split around the middle or into valves [1. Hypoxis](#)
- Ovary far below the perianth-segments which are separated from it by a long slender stipe-like tube; fruit indehiscent [2. Curculigo](#)

Molineria capitata (Lour.) Merrill

Originally from Assam, it is commonly cultivated in Freetown.

1. HYPOXIS

Linn., Syst. ed. 10, 986 (1759); F.T.A. 7: 377; Nel in Engl., Bot. Jahrb. 51: 301 (1914).

- 1 Leaves about 1-2 cm. broad with about 10 principal nerves; rhizome massive, more than 2 cm. diam., surmounted by old fibrous leaf-bases; anthers entire at apex; perianth-segments 1 cm. long, the inner whorl nearly glabrous: [2](#)
- Leaves up to 5 mm. broad, from a few cm. to 30 cm. long, with about 4 principal nerves, margins and midrib outside villous; rhizome fusiform, about 1 cm. diam. usually without old fibrous leaf-bases; inflorescences 1-3-flowered, densely appressed-pilose; perianth segments 4-5 mm. long, the inner whorl glabrous or pilose in the middle; anthers slightly divided at apex [3. angustifolia](#)

- 2 Inflorescences ascending and leaves more or less markedly recurved; inflorescences densely pilose, with (2-)3-6 flowers; leaves developing just after the inflorescence and sometimes markedly recurved with the young ones appearing almost contorted, folded, finally attaining a length of 30-40 cm., ciliate or pilose at the margins and on the midrib outside [1. recurva](#)
- Inflorescences and leaves nearly straight and erect; inflorescences densely long-pilose, with 4-8(-10) flowers; leaves finally attaining a length of up to 80 cm., long-pilose at the margins and on the midrib outside, and sometimes also on the other surface [2. urceolata](#)

1. **Hypoxis recurva** Nel in Engl., Bot. Jahrb. 51: 325 (1914).

APD: *Synonym of Hypoxis camerooniana Baker*

Hypoxis ledermannii Nel l.c. 314.
Hypoxis thorbeckei Nel l.c. 328.
Hypoxis lanceolata Nel l.c. 325.
Hypoxis suffruticosa Nel l.c. 335
Hypoxis villosa var. **foliis recurvis** Hook. f. in J. Linn. Soc. 7: 223 (1864).
Hypoxis villosa of F.T.A. 7: 379, partly, not of Linn. f.

Subterranean rhizome giving rise to several massive erect rhizomes bearing succulent white roots and masses of old leaf fibres; inflorescences appearing during the dry season before the leaves, which develop before flowering is completed; flowers yellow, frequented by bees; [in montane grassland](#).

S. Nig.: Obudu Plateau, 5,000 ft. (Feb.) Tuley 583! **W. Cam.:** Cam. Mt., 7,000-8,000 ft. (Nov.-Feb., Apr.) Mann 1224! 2133! Maitland 1023! Brenan 9567! Bafut-Ngemba F.R., Bamenda, 6,000 ft. (Mar.) Richards 5311! L. Bambuluwe, Bamenda, 7,000 ft. (Feb.) Thorbecke 231! 275! Hepper 2111! Kufum (Dec.) Ledermann 2007! Brunt 840!

Also in **E. Cameroun**.

[Several species described by Nel can hardly be maintained as distinct in this confusing genus. The appearance of the plants changes as the leaves develop. However, field workers should observe the variation within populations to determine the taxonomic worth of the various characteristics. Nel seems to have been in error in attributing divided anthers to *H. ledermannii*.-F.N.H.]

2. **Hypoxis urceolata** Nel l.c. 336 (1914); Morton, W. Afr. Lilies & Orch. fig. 36. *APD acc*

APD: *Synonym of Hypoxis suffruticosa Nel*

Large rhizome bearing fibrous leaf bases; inflorescences up to 10 ins. high appearing before and with the leaves; flowers yellow; [in upland savanna](#).

N. Nig.: Jos Plateau (Apr.) Lely P202! Naraguta (July) Lely 14! Lawlor & Hall 121! Zelau (Apr.) Lely 114! Werran, Plateau Prov. (Apr.) Gregory 25!

Extending to E. Africa.

[Typically with 6 perianth lobes but 4 may be found. Some plants approach *H. angustifolia* Lam. in having narrow leaves with 2-4 principal nerves, but larger flowers and rhizome.]

3. **Hypoxis angustifolia** Lam. *Encycl. 3: 182* (1789); F.T.A. 7: 378; Nel l.c. 303; Morton l.c. fig. 36.

APD: *Synonym of Curculigo pilosa subsp. minor (Guinea) Wiland_Szymanska*

Hypoxis camerooniana Bak. in F.T.A. 7: 577 (1898); Nel l.c. 302; P.W.T.A., ed. 1, 2: 394.
Hypoxis djalensis Hutch. in F.W.T.A., ed. 1, 2: 394 (1936), English descr. only.
Curculigo djalensis A. Chev., Bot. 635 (1920), name only.

A small herb with narrow grass-like leaves; flowers yellow, [in upland savanna](#).

Guin.: Passo, nr. Pita, Fouta Djallon (July) Adames 293! **S. L.:** Musaia, Koinadugu Dist. (Aug.) Haswell 37! Bintumane Peak, Loma Mt., 6,000 ft. (May, Aug.) Deighton 5090! Jaeger 1048! **N. Widespread in tropical Africa and in Madagascar.

VELLOZIACEAE

Stems woody and fibrous, dichotomously branched, covered with the persistent bases of the fallen leaves; habit arborescent or shrubby. Leaves crowded in a tuft at the ends of the branches, narrow, often pungent-pointed. Flowers solitary on each peduncle, white, yellow, or blue, sometimes very handsome, actinomorphic, bisexual. Perianth-tube very short or absent; segments equal, spreading. Stamens 6, or numerous and in 6 bundles of 2-6; anthers linear, basifixed, opening by longitudinal slits. Ovary inferior, 3-locular; style slender, with a capitate stigma or 3 short arms. Ovules very numerous on axile, stalked placentas. Fruit a dry or hard capsule, often flat or concave on the top, crowned with

the scar of the perianth, or 6-toothed, sometimes spiny, loculicidally dehiscent. Seeds numerous, embryo small in copious, rather hard endosperm.

A small family occurring in S. America, Southern Africa, tropical Africa, Madagascar and [Arabia](#).

VELLOZIA

APD: Synonym of Xerophyta Juss.

Vand., Fl. Lusit. Bras. Sp. 32, t. 2, fig. 11 (1788).

- 1** Perennial herb, stems numerous up to 50 cm. long, 1.5-2 cm. diam.; leaves linear, coriaceous, acute at apex, up to 32 cm. long and 6 mm. broad, glabrous but the margin and dorsal nerves minutely and inconspicuously aculeate towards the apex; peduncles solitary in leaf axils, shorter than the leaves, setose in the upper part; perianth-lobes linear-lanceolate, acute at apex, 3 outer ones about 3.5 cm. long and 8 mm. broad, 3 inner ones about 3 cm. long and 10 mm. broad; anthers 17-20 mm. long; style 16 mm. long, ovary 6 mm. long, obscurely 3-angled; ovules numerous; fruit subglobose 1.7 cm. long, 1.5 cm. diam.; seeds subcylindrical, 3 mm. long, nearly 1 mm. diam. [schnitzleinia var. occidentalis](#)

Vellozia schnitzleinia (Hochst.) Bak. in F.T.A. 7: 409 (1898).

APD: Synonym of Xerophyta schnitzleinia (Hochst.) Baker

Hypoxis schnitzleinia Hochst (1844).

var. schnitzleinia is widespread in eastern Africa and var. somaliensis Terrac. occurs in Somalia.

Vellozia schnitzleinia var. occidentalis Milne-Redh. in Kew Bull. 5: 381 (1951).

APD: Synonym of Xerophyta schnitzleinia (Hochst.) Baker var. *schnitzleinia*

A stout perennial herb with stems about 11/2 ft. long, covered with old leaves; flowers white; [forming thick mats on bare rock in savanna woodland](#).

N. Nig.: Anara F.R., Zaria (May) Keay FHI 22903! 25758! Olorunfemi FHI 24356! Gawu Hills, Niger Prov. (June, Aug.) Onochie FHI 35936! E. W. Jones FHI 42224! NE. of Kaduna (July) Jackson FHI 55409!

TACCACEAE

Perennial herbs with a tuberous or creeping rhizome. Leaves all radical, large, entire or much lobed. Flowers actinomorphic, hermaphrodite, umbellate; bracts forming an involucre, the inner often thread-like. Perianth with a short tube and 6 lobes, lobes 2-seriate, mostly somewhat corolline. Stamens 6, inserted on the perianth; filaments short; anthers 2-celled, opening lengthwise. Ovary inferior, 1-celled, with 3 parietal placentas; style short, the 3 stigmas often petaloid and reflexed over the style; ovules numerous. Fruit a berry or rarely opening by valves. Seeds numerous, with copious endosperm and minute embryo.

Tropical regions and China, with two genera.

TACCA

J. R. & G. Forst., Char. Gen. Pl. 69 (1776); F.T.A. 7: 413. Nom. cons.

Characters of the family; fruit a berry.

- 1** Leaves erect, shining, 3-partite, each segment 2-forked, pinnatipartite, the lower lobes separated, the upper ones connected, sometimes one segment not 2-forked, glabrous; peduncle long and rather slender; involucre bracts about 6, obovate-spathulate, strongly nerved outside, 3-4 cm. long, acuminate and sometimes lobed at the apex; innermost bracts up to 10 cm. long and thread-like; fruit ovoid-ellipsoid, about 3.5 cm. long; seeds ribbed

[*leontopetaloides*](#)

Tacca leontopetaloides (Linn.) O. Ktze. Rev. Gen. Pl. 2: 704 (1891); Carter in F.T.E.A. Taccac. 1, fig. 1 (1962). *APD acc*

Also in **E. Cameroun**, **the Congos** and **Angola**.

[Note: I have maintained the species concept of Jonker in his Monograph, but *B. latialata* and *B. liberica* are not satisfactorily separable on the wing characters. Other tropical African species can also be included in the complex. -F.N.H.]

6. **Burmattia welwitschii** Schltr. in Fedde, Rep. 21: 84 (1925).

APD: *Synonym of Burmannia madagascariensis Baker*

A small erect annual 21/2-5 in. high, sometimes branched; flowers in a terminal cluster or solitary; **in wet places.**

Guin.: near Pita Pobéguin!

Widespread in tropical Africa.

3. OXYGYNE

Schltr. in Engl., Bot. Jahrb. 38: 140(1906); Jonker, Monogr. Burmanniac. 260 (1938).

- 1 A tiny saprophyte about 4 cm. high; stem 1-flowered, covered with several scales; bract similar to the upper scales, rounded; flower erect, about 2.2 cm. long; perianth narrowly campanulate, tube about 1 cm. long, lobes broadly triangular-acuminate, narrowly caudate-acuminate [1. triandra](#)

Oxygyne triandra Schltr. l.c. 140, fig. 1 G-M (1906), and in Notizbl. Bot. Gart. Berl. 8: 45 (1921); Jonker l.c. *APD acc*

W. Cam.: Moliwe (Sept.) Schlechter 15790!

4. AFROTHISMIA

(Engl.) *Schltr.* in Engl., Bot. Jahrb. 38: 138 (1906); Jonker, Monogr. Burmanniac. 222 (1938). *APD acc*

- 1 Perianth with a right-angle bend in the middle, perianth-lobes 6, narrowly triangular or filiform and spreading from the open throat, 4.5-15 mm. long; plants 2.5-12 cm. high, 1-3-flowered, stem usually simple with the underground part possessing spherical clusters of tubers or bulbils bearing fine rootlets [1. winkleri](#)
- Perianth obovoid sometimes bent at the base, perianth-lobes 6, shortly subulate and clustered over the small throat, about 2 mm. long; habit similar to the last [2. pachyantha](#)

1. **Afrothismia winkleri** (Engl.) Schltr. l.c. 139 (1906), and in Notizbl. Bot. Gart. Berl. 8: 44 (1921);

Jonker l.c. 223. *APD acc*

A small white saprophyte in the [forest floor litter](#); " ovary and fruit cream, base of perianth-tube cream with six white (or purple?) V-shaped marks, centre of perianth white with crimson patch above, mouth and lobes of perianth yellow, stamens cream " (Keay).

S. Nig.: Aponmu, Akwe F. B. (Nov.) Keay FHI 25540! **W. Cam.:** New Tegel, near Buea (July) Winkler 225! Moliwe (Sept.) Schlechter 15788!

Also in **E. Cameroun** and **Uganda**.

2. *Afrothismia pachyantha* *Schltr.* in Engl., Bot. Jahrb. 38: 139, fig. 1, A-F (1906), and in Notizbl. Bot. Gart. Berl. 8: 44; Jonker l.c. 224. *APD acc*

A tiny saprophyte up to 11/2 in. high; perianth about 1/4 in. long; [in forest](#).

W. Cam.: Moliwe (Sept.) Schlechter 15789!

ORCHIDACEAE

Perennial, terrestrial, epiphytic or saprophytic herbs with rhizomes or tuberous roots or rootstock; stem leafy or scapose, frequently thickened at the base into pseudobulbs and bearing aerial assimilating roots. Leaves undivided, alternate and often distichous, rarely opposite, sometimes all reduced to scales, often fleshy, sheathing at the base. Flowers bracteate, hermaphrodite or very rarely polygamous or monoecious, zygomorphic; inflorescence spicate, racemose or paniculate, or flowers solitary. Perianth epigynous, composed of 6 petaloid segments (tepals) in 2 whorls, or the outer whorl calyx-like and the inner corolla-like, or the outer rarely corolla-like and the inner minute, free or variously connate in each whorl; outer segments (sepals) imbricate or subvalvate, the middle segments of each whorl generally different in size and colour from the lateral ones, especially the middle petal which is often extremely complicated in structure and is termed the lip or labellum; the basal part of the labellum, the hypochile, is often articulated to the base of the column or is much constricted, when it is termed the claw; the middle part, the mesochile and the apical part, the epichile, may be variously lobed and often bear outgrowths. On account of the twisting of the ovary through 180°, the labellum is often placed in an abaxial position; frequently the labellum or more rarely the odd sepal is prolonged into a sac or spur, sometimes very long. Stamens 2 or 1; stamens and style united to form a special structure (column), the apex of which may be produced vertically into stielidia or laterally into wings, and the base of which may be produced downwards to form a foot; anther or anthers 2-locular, introrse, opening by a slit lengthwise; often operculate, i.e. can be lifted like a little cap; pollen granular or generally agglutinated into mealy, waxy or bony masses (pollinia); at one end the pollinium may be extended into a sterile portion (caudicle); the pollinia may be free in the anther-loculi or more or less loosely united. Ovary inferior, 1-locular with 3 parietal placentas or very rarely 3-locular with axile placentas, usually produced at the apex to form the column; stigmas 3 fertile, or more frequently the lateral 2 fertile, the other sterile and transformed into a small outgrowth (rostellum) which lies between the anther and the stigmas; a portion of the rostellum is sometimes modified into a viscid disk or disks (viscidia) to which the pollinia are attached, often by a stalk or stipes. Ovules very numerous and minute. Fruit usually a capsule, mostly opening laterally by 3 or 6 longitudinal slits. Seeds very numerous, minute, often drawn out at each end, or rarely winged, without endosperm; embryo not differentiated.

Widely distributed, most numerous and of very diverse form in the tropics; main centres of distribution Indo-Malaya and tropical America.

KEY TO THE GENERA

- 1 Anther attached to the column by its base, loculae adnate to the column and persistent; pollinia granular, with caudicles and 2 (or rarely 1) viscidia; mostly terrestrial with erect annual leafy stem and terminal inflorescence, a few epiphytic or saprophytic:2

Anther attached to the column by its apex (usually at the back of the column), either operculate (i.e. the anther can be lifted like a little cap, the pollinia often being carried with it) or erect and persistent, the caudicle and

- viscidium being then at the top:..... **13**
- 2** Lip with 1 or 2 distinct but sometimes rather short spurs:..... **3**
 Lip sometimes concave at the base but with no distinct spur: **9**
- 3** Spurs 2; lip at top of flowers (flowers not resupinate); sepals and petals similar, more or less united to one another and to the lip; column slender, somewhat curved; stigma superior, cushion-like, fleshy; anther pendulous [9. *Satyrium*](#)
 Spur 1: **4**
- 4** Lip more or less united to the column; leaves radical, orbicular [1. *Holothrix*](#)
 Lip quite free from the column:..... **5**
- 5** Stigmas sessile; stems leafy all the way up; bracts leaf-like [3. *Brachycorythis*](#)
 Stigmas borne on or forming club-shaped processes, projecting from the front of the column, free or partly united to the lateral lobes of the rostellum: **6**
- 6** Stigmatic processes partly united to the lateral lobes of the rostellum; rhachis and ovary frequently glandular pubescent:..... **7**
 Stigmatic processes free from the rostellum:..... **8**
- 7** Flowers bluish, side lobes of lip entire [4. *Cynorkis*](#)
 Flowers green, side lobes of lip fimbriate [5. *Habenaria*](#)
- 8** Middle lobe of rostellum concave, frequently placed some way in front of the anther; lip entire or with a small tooth-like lobe on each side at the base; petals entire or with a small lobe at the base, more or less falcate; dorsal sepal large, convex, laterals sharply deflexed; inflorescence few-flowered [6. *Platycoryne*](#)
 Middle lobe of rostellum usually flat or subulate, more or less adpressed to the anther; other characters not associated as in last [5. *Habenaria*](#)
- 9** Dorsal sepal drawn out into an erect or pendulous spur; lip entire or with short tooth-like lateral lobes; rostellum small, tooth-like: **10**
 Dorsal sepal without a spur: **11**
- 10** Petals free from dorsal sepal; anther erect or horizontal [7. *Disa*](#)
 Petals united to dorsal sepal; anther horizontal [8. *Brownleea*](#)
- 11** Rostellum large, more or less orbicular, forming a shield-like process covering the anther; lip united to the column at the base; dorsal sepal and petals united to form a variously shaped hood; lateral sepals each with a small spur-like sac near the inner margin [10. *Disperis*](#)
 Rostellum rather small, cucullate, shorter than the anther; lip free from the column; dorsal sepal and petals free: **12**
- 12** Plants with numerous leaves; inflorescence usually many-flowered [3. *Brachycorythis*](#)
 Dwarf leafless plants; inflorescence up to 4-flowered [2. *Schwartzkopffia*](#)
- 13** Pollinia granular or much divided into small masses attached to a common axis: **14**
 Pollinia waxy, entire, 2, 4 or 8, either free, or adhering at one end by viscid outgrowths (the caudicles), or attached to 1 or 2 sticky gland-like structures (the viscidia); anther operculate: **23**
- 14** Tall climbers with fleshy green stems and usually with leaves; flowers in short axillary racemes, rather large (perianth at least 2 cm. long); lip more or less united to the long curved column, disk bearing either scales or lines of hairs [11. *Vanilla*](#)
 Terrestrial, erect or rarely somewhat decumbent herbs with usually terminal but rarely lateral inflorescences: **15**
- 15** No leaves at time of flowering or saprophytic and non-chlorophyllose; flowering stems arising from underground tuber; rostellum short or minute: **16**
 Leafy plants usually with slender creeping rhizome or fibrous rootstock; rostellum elongate: **18**
- 16** Lip with a distinct spur; saprophytic [13. *Epipogium*](#)
 Lip without a spur: **17**
- 17** Slender saprophytic plants with short raceme of small flowers (less than 1 cm. long); lip simple with a slender claw; petals and sepals united to one another in the lower part; capsule borne on elongated pedicels [14. *Auxopus*](#)
 Flowers appearing on leafless scapes before the leaves; leaf solitary, reniform or ovate with a long or short petiole; flowers over 1 cm. long, usually few; lip more or less trilobed, bearing either numerous hairs or 2 distinct keels; petals and sepals free [12. *Nervilia*](#)
- 18** Stems up to 6 ft. high, rigid, leafy; leaves plicate, lanceolate or narrowly elliptical, lamina 15-35 cm. long; inflorescences axillary or terminal, paniculate; perianth-segments over 5 cm. long, linear; Up very like other segments but broadly ovate at apex [20. *Corymborkis*](#)

- Stems less than 3 ft. high including inflorescence, not very rigid, often decumbent at the base; leaves soft and thin, frequently with a long petiole, lamina less than 20 cm. long, usually much shorter; flowers less than 1 cm. long: **19**
- 19** Lateral sepals united to one another and to the petals for at least half their length; column with 2 terminal appendages: **20**
- Lateral sepals free or only united at the very base: **21**
- 20** Stem elongated, decumbent below, erect and leafy at apex; lip free from the sepals, with a spreading limb, narrow claw and concave base; appendages of column entire [17. *Cheirostylis*](#)
- Stem very short with a bunch of radical leaves; lip united to the sepals, at the base of the free part provided with 2 small reflexed marginal appendages; appendages of column serrate [15. *Manniella*](#)
- 21** Column much longer than broad; arms of rostellum long, subulate, acute [16. *Platylepis*](#)
- Column short, nearly as broad as long; arms of rostellum short and acute, or if larger linear-spathulate, obtuse: **22**
- 22** Column with 2 usually parallel longitudinally placed keels on the front; flowers usually not resupinate [19. *Hetaeria*](#)
- Column without keels on the front; flowers resupinate [18. *Zeuxine*](#)
- 23** Growth sympodial, consisting either of annual growths from a tuberous underground root or stem, or of a series of erect or creeping lateral shoots, the stem in each growth being often partly thickened to form a fleshy pseudobulb; inflorescence terminal on the year's growth, or axillary: **24**
- Growth monopodial, continued by a relatively slow-growing apical bud; no pseudobulbs; leaves when present more or less distichous, fleshy, conduplicate, very frequently unequally bilobed at the apex; inflorescences always axillary; pollinia with stipes and viscidium; nearly all epiphytic: **36**
- 24** Pollinia 8: **25**
- Pollinia 2 or 4, in the latter case sometimes united in pairs: **27**
- 25** Lip adnate to the column, with a long slender spur; inflorescence tall, many-flowered, apparently terminal; column short; leaves plicate [26. *Calanthe*](#)
- Lip free from column, spur absent or broadly sac-like; inflorescence short, 1-3-flowered: **26**
- 26** Inflorescence lateral from base of leafy pseudobulb; leaves plicate; column long and slender; pollinia equal, elongate, attached to a sticky appendage [27. *Ancistrochilus*](#)
- Inflorescence terminal between leaves at apex of pseudobulb, leaves conduplicate; column short; pollinia 4 large and 4 small, pyriform, free; low creeping plants [25. *Stolzia*](#)
- 27** Anther 2-locular; pollinia free or joined together by a sticky appendage, neither attached to the rostellum nor possessing a distinct viscidium: **28**
- Anther incompletely 2-locular; pollinia attached by a stalk (stipes) to the viscidium (both stipes and viscidium are part of the rostellum), which comes away with them: **30**
- 28** Column not produced downwards into a foot; lip continuous with the base of the column; inflorescence terminal on the annual leafy growths; pseudobulbs not well defined and often absent: **29**
- Column usually short, produced downwards into a foot often nearly as long as itself; lip articulated on the column-foot and freely moving; inflorescences arising from the base of the pseudobulbs; pseudobulb well defined, bearing 1-2 (rarely 3) leaves at the apex [28. *Bulbophyllum*](#)
- 29** Anther attached at the back below the apex of the column; rostellum terminal; column short; sympodial growths usually forming a slender creeping rhizome, the erect stems being distant from one another; pseudobulbs absent; leaves some way from the base of the stem [21. *Malaxis*](#)
- Anther attached at the apex of the column; rostellum subterminal; column rather long, often curved; sympodial growths usually closely placed, often pseudobulbous; leaves usually near the base of the stem [22. *Liparis*](#)
- 30** Flowers not resupinate (lip uppermost); mostly epiphytic or on rocks: **31**
- Flowers resupinate (dorsal sepal uppermost); mostly terrestrial, a few epiphytic: **33**
- 31** Terrestrial with underground tubers but without pseudobulbs; column without a foot; leaves plicate; viscidium large, transversely rhomboid [32. *Pteroglossaspis*](#)
- Mostly epiphytic or on rocks, no tubers but often with pseudobulbs; column with a distinct foot; leaves not plicate; viscidium small, often poorly developed: **32**
- 32** Inflorescence terminal on the leafy shoots; petals easily visible [24. *Polystachya*](#)
- Inflorescence axillary from the base of the distantly placed pseudobulbs; petals minute [29. *Genyorchis*](#)
- 33** Lip without a spur; epiphytic; pseudobulbs tall, fusiform, many-leaved; inflorescence paniculate; sepals and petals similar [23. *Ansellia*](#)
- Lip with a distinct spur or very concave sac at the base: **34**
- 34** Epiphytic; rostellum long, beak-like; inflorescence paniculate [33. *Graphorkis*](#)

- Terrestrial, or very rarely epiphytic; rostellum very short and broad: 35
- 35 Lip 4-lobed or 3-lobed with clearly retuse middle-lobe.; pseudobulbs well-developed, 1-2-leaved; petioles articulated irregularly above junction with pseudobulb; leaves fleshy, conduplicate, often variegated30.
[Eulophidium](#)
- Lip entire to 3-lobed, middle lobe scarcely retuse; pseudobulbs often lacking, but plant with tuberous underground stem; leaves plicate, often not developed at time of flowering 31. [Eulophia](#)
- 36 Leaves absent; roots very abundant, assimilating:..... 37
- Leaves present: 40
- 37 Sepals and petals united to one another in the lower two-thirds; lip with a cucullate apex and retrorse point on upper surface at apex; spur almost spherical 37. [Taeniophyllum](#)
- Sepals and petals free to the base: 38
- 38 Rostellum long and slender, sword-like, projecting forwards from the column; stipes long and narrow; viscidium linear-ligulate 40. [Encheiridion](#)
- Rostellum not sword-like, usually quite short: 39
- 39 Lip lamina reduced to a small point in front of the spur; mouth of spur with tall erect 3-angled tooth-like callus; apex of stipes much enlarged, partially enveloping the pollinia; viscidium short 41. [Chauliodon](#)
- Lip lamina variously developed, usually quite large; no vertical tooth in mouth of spur 39. [Microcoelia](#)
- 40 Rostellum not elongated, so deeply cleft that the apex of the column appears to be bifid, in front; lip usually very concave, entire, the base more or less enveloping the column, frequently with a central longitudinal keel; mouth of spur wide, the disk of the lip gradually passing into the spur 36. [Angraecum](#)
- Rostellum elongated, easily distinguishable, often deeply bifid, sometimes with an additional central lobe: 41
- 41 Lip with a small tooth-like or rim-like callus in the centre at the mouth of the spur; mouth of spur narrow; pollinia with separate stipes and common viscidium or each with its own stipes and viscidium 42.
[Diaphanathe](#)
- Lip without any tooth-like callus:..... 42
- 42 Column long and slender, terete below the stigma, 3.5-4 cm. long; perianth-segments all very similar, the lip broader than the others; spur over 15 cm. long 48. [Barombia](#)
- Column usually rather thick, 1 cm. or less in length, rarely terete; spur very rarely over 15 cm. long, usually much shorter:..... 43
- 43 Pollinia on a single stipes and viscidium, the stipes very rarely bilobed in the upper part and bearing one pollinium on each lobe: 44
- Pollinia with separate stipes and either a common viscidium or 2 separate viscidia: 51
- 44 Stipes of pollinia elliptical, somewhat constricted below the middle, the apex running down into a deep depression at the back of the androclinium, the pollinia attached near the centre of the ovate upper part; viscidium rectangular, attached to the anticous margin of the stipes; lip trilobed; stem long; inflorescences several-flowered 52. [Dinklageëlla](#)
- Stipes of pollinia linear or somewhat widened in the upper part, the pollinia attached near or at the apex: 45
- 45 Rostellum produced downwards and then sharply reflexed parallel to itself so that the apex points upwards, bipartite almost from the base; stipes somewhat shortly bifid at the apex; viscidium long and narrow, attached to nearly the whole length of the rostellum; inflorescences short and dense-flowered, arising at the base of the plant in the axils of the oldest leaves or leaf-bases 54. [Ancistrohynchus](#)
- Rostellum not sharply recurved upwards in the apical part: 46
- 46 Stems elongated, bearing leaves at more or less regular intervals usually for the greater part of their length: .. 47
- Stems short, bearing all the leaves closely together: 50
- 47 Spur with a narrow mouth, easily distinguishable from the limb of the lip, almost straight, not or only slightly thickened in the apical part: 48
- Spur with a wide mouth, gradually merging into the limb of the lip, narrowest in the middle and swollen at the apex: 49
- 48 Viscidium large, nearly as long as the stipes, elliptical or oblong; lip entire, without thickened basal auricles 56.
[Eggelingia](#)
- Viscidium small, much shorter than the long narrow stipes; lip frequently 3-lobed, the side-lobes sometimes tooth-like, in most species with thickened auricles on each side of the mouth of the spur 57. [Tridactyle](#)
- 49 Spur abruptly recurved near the apex, about as long as the rest of the lip; lip usually distinctly 3-lobed; perianth-segments acuminate 35. [Calyptrochilum](#)
- Spur straight or very gently curved, much longer than the rest of the lip; lip indistinctly 3-lobed or entire; perianth-segments obtuse 51. [Solenangis](#)

- 50 Spur with a narrow mouth, easily distinguishable from the limb of the lip, usually much longer than the rest of the lip and not or scarcely thickened in the apical part; lip acute, very similar in shape to the other perianth-members [47. *Aërangis*](#)
- Spur with a wide mouth, gradually merging into the limb of the lip, about the same length as the rest of the lip, distinctly thickened and recurved in the apical part; lip obtuse, obscurely trilobed, much broader than the other perianth-segments [53. *Eurychone*](#)
- 51 Leaves terete, or Iris-like, radiating like a fan from a common point, the 2 surfaces facing sideways, quite entire at the apex, closely imbricate at the base, fleshy; pollinia with a common viscidium: **52**
- Leaves not terete nor Iris-like, the surfaces usually placed horizontally and frequently much reflexed, or if vertically placed the apices more or less unequally bilobed: **55**
- 52 Leaves terete; stems elongated; inflorescences short, few-flowered; lip bilobed with elliptical rounded lobes; stipites slender, shorter than the pollinia [58. *Nephrangis*](#)
- Leaves Iris-like; lip entire or more or less trilobed: **53**
- 53 Inflorescences much shorter than the leaves, rather dense-flowered, flowers with long pedicels; spur much longer than the limb of the lip, swollen at the apex, nearly straight; lip entire [34. *Podangis*](#)
- Inflorescences about as long as, or longer than, the leaves, sometimes a little shorter; spur not swollen towards the apex: **54**
- 54 Flowers with long pedicels; sepals over 6 mm. long; lip entire, ovate or lanceolate; spur longer than the limb of the lip, incurved at the apex only [49. *Rangaëris*](#)
- Flowers with very short pedicels; sepals less than 4 mm. long; lip with rounded side-lobes and acute middle-lobe; spur equal to or shorter than the limb of the lip, sharply curved forward under the lip [44. *Bolusiella*](#)
- 55 Flowers in very dense almost spherical subsessile inflorescences at the base of the leaves; bracts large, as long as the flowers; rostellum produced downwards and then recurved sharply parallel to itself, deeply bifid; viscidium elongated, attached to nearly the whole length of the rostellum [54. *Ancistrohynchus*](#)
- Flowers in long and usually relatively lax inflorescences, bracts much shorter than the flowers; rostellum never as above: **56**
- 56 Rostellum long and beak-like, longer than the short column, bifid for two-thirds of its length; viscidium elongated, either linear or with a broad rolled-up portion to which the stipites are attached and a narrow hyaline portion adnate to the apical part of the rostellum; lip similar to perianth-segments, all narrow and acuminate; spur somewhat widened towards the mouth, at least twice as long as the lip [50. *Cyrtorchis*](#)
- Rostellum shorter than the column; viscidium as broad as long or rarely shortly rectangular: **57**
- 57 Lip deeply 3-lobed, the lateral lobes narrow and spreading; petals more or less deltoid, the anticous margin rounded and projecting a long way forward [55. *Angraecopsis*](#)
- Lip entire, very shortly 3-lobed at the apex only, or rarely with almost orbicular side lobes at the base: **58**
- 58 Mouth of spur some distance from base of lip, base of column and attachment of lateral sepals; inflorescence erect, very dense; flowers small; leaves with parallel margins, closely imbricate at the base; viscidium common [38. *Listrostachys*](#)
- Mouth of spur immediately below base of column or attachment of lateral sepals: **59**
- 59 Viscidium 1, common to 2 pollinia and stipites: **60**
- Viscidium 2, each with pollinium and stipes: **62**
- 60 Spur swollen at the apex; flowers small (sepals 3-6 mm. long), sometimes opposite or whorled [45. *Chamaeangis*](#)
- Spur tapering towards the apex, often much longer than the lip; flowers rather small (sepals 7 mm. long) to large: **61**
- 61 Lip indistinctly 3-lobed at the apex, lateral lobes rounded, somewhat toothed, middle lobe much longer, acuminate, at the base of the lip a toothed projection on each side of the mouth of the spur; rostellum long, subulate; viscidium small, rounded [46. *Plectrelminthus*](#)
- Lip quite entire, with no toothed projection, on the sides at the base, rarely 3-lobed with almost orbicular side lobes; rostellum shorter, usually bifid, or trifid [49. *Rangaëris*](#)
- 62 Lip indistinctly 2-3-lobed, obtuse; sepals and petals obtuse: **63**
- Lip quite entire, acute; sepals and petals acute or acuminate [49. *Rangaëris*](#)
- 63 Lip much longer than broad, distinctly constricted in the middle; petals oblong [43. *Sarcorrhynchus*](#)
- Lip usually broader than long, sometimes length and breadth about equal; petals nearly orbicular or broadly ovate [42. *Diaphananthe*](#)

Diceratostele gabonensis Summerh. APD acc

Additional genus: since this account was written, it has been discovered in the Ivory Coast (Tiapleu Forest (Sept.) Aké Assi 3297!)

Spathoglottis plicata *Bl. APD acc*

Many species of orchids from tropical America and tropical Asia are cultivated as ornamentals throughout Africa. Occasionally a species may become more or less naturalized and a well-known example of this is the Asiatic species above.

1. HOLOTHRIX

Rich. ex Lindl., Gen. & Sp. Orch. Pl. 257, 283 (1835); F.T.A. 7: 190. Nom. cons.

Deroemera *Rchb. f.* (1852)—F.T.A. 7: 193; F.W.T.A., ed. 1, 2: 405.

- 1 Scape densely and retrorsely pubescent, without sheaths, 6-16 cm. long; leaves 2, 1-1.5 cm. long, upper smaller; lip 7-toothed; flowers in a short, spike, white, tinged with mauve; sepals and petals 3-toothed at apex [1. tridentata](#)

Scape glabrous, with numerous lanceolate acuminate sheaths in the lower part, up to 18 cm. high; leaf solitary, withering just before or at flowering time; lip elliptical, 3-lobed, side lobes rounded, middle lobe narrow, acute, 4-5 mm. long; inflorescence 10-30-flowered; petals oblong, triapiculate, the middle lobe longest [2. aphylla](#)

1. Holothrix tridentata (*Hook. f.*) *Rchb. f.* Otia Bot. Hamburg. 119 (1881); F.T.A. 7: 193. *APD acc*

Peristylus tridentatus *Hook. f.* in J. Linn. Soc. 7: 221 (1864).

Holothrix platydactyla *Kraenzl.* (1893)-F.T.A. l.c.

A dwarf herb up to 5 in. high with 2 basal flattened leaves and mauve-white flowers.

W. Cam.: Cam. Mt., 7,000-11,000 ft. (Oct.-Nov.) Mann 2128! Preuss 1036! Johnston!

3. BRACHYCORYTHIS

Lindl., Gen. & Sp. Orch. Pl. 363 (1838); F.T.A.. 7: 200; Summerhayes in Kew Bull. 9: 226 (1955).

Diplacorchis Schltr. (1921)-F.W.T.A., ed. 1, 2: 405.

Phyllomphax Schltr. (1919)-F.W.T.A., ed. 1, 2: 407.

- 1 Leaves softly velvety; lip without obvious spur; lamina of lip flat, trilobed towards apex, lobes about equal or middle shorter than laterals [10. pubescens](#)
 Leaves quite glabrous; lip spurred or unspurred: **2**
- 2 Spur of lip conical with an acute apex or elongated and obtuse, often over 4.5 mm. long: **3**
 Spur of lip very broad and rounded or absent, the base then boat-shaped: **5**
- 3 Leaves broadly lanceolate or elliptical-lanceolate, up to 13 cm. long and 5 cm. broad, more or less spreading, not very stiff; all but lowest flowers considerably longer than the bracts; lamina of lip broadly obcordate, 1.5-2 cm. long and broad; spur with a narrow acute apex from a broader swollen base, 7.5-10 mm. long; petals quite free from column [1. macrantha](#)
 Leaves narrowly lanceolate, up to 9 cm. long and 1.5 cm. broad, suberect, rather stiff; flowers equalling or shorter than the bracts; petals united at their base to the column: **4**
- 4 Lamina of lip broadest at the base, sometimes with a lobe on each side, apical part narrow, tongue-shaped, 5-8.5 mm. long; spur equally broad to apex or somewhat thickened in apical part, apex obtuse, 4.5-8.5 mm. long. [2. tenuior](#)
 Lamina of lip broadest above the middle, obovate, truncate in front, tapering towards the base; spur distinctly conical with a broad mouth and narrow acute apex, 2.5-6 mm. long [3. conica](#)
- 5 Largest leaves in lower part of stem, upper part with few usually much smaller leaves; middle lobe of lip usually much longer than laterals, latter quite rounded and not at all sickle-shaped; lower bracts shorter than the flowers; spur of labellum short and rounded [4. paucifolia](#)
 Largest leaves in middle or upper part of stem, lower part of stem usually covered with sheaths; middle lobe of lip equalling or shorter than laterals and always much smaller, laterals more or less sickle-shaped or incurved and acute; lower bracts usually longer than the flowers: **6**
- 6 Epichile (apical part) of lip with a conical projecting callus just in front of the sac-like hypochile, reniform, the middle lobe shorter and smaller than the lateral lobes; dorsal sepal 4-5 mm. long; spike dense, 1-2 cm. diam.; sides of basal part of lip broadly angled [6. buchananii](#)
 Epichile of lip without a conical basal callus but usually with a longitudinal ridge terminating in the middle lobe; dorsal sepal 5-14 mm. long; spike over 2 cm. diam.: **7**
- 7 Lip scarcely longer than the sepals, about 1 cm. long, the middle lobe about the same length as the laterals; plant about 70-100 cm. high with many-flowered inflorescence 10-18 cm. long and 3-4 cm. diam.; spur rounded, up to 4.5 mm. long [5. sceptrum](#)
 Lip considerably longer than the sepals, the middle lobe much shorter than the lateral lobes; spur absent, base of lip boat-shaped: **8**
- 8 Hypochile of lip short, 1.5-2 mm. long from back to front, sides triangular; leaves terminating in a very long fine point, lanceolate or narrowly lanceolate; petals lying forward from column, semi-orbicular or broadly obovate; stem and leaves becoming black on drying; leaves and flowers numerous [7. pleistophylla](#)
 Hypochile of lip 3.5-6 mm. long from back to front, sides sloping down from column, not or scarcely angled; leaves acuminate but usually not very finely pointed, lanceolate or broadly lanceolate; petals ovate or elliptical-ovate; stem and leaves not blackening on drying: **9**
- 9 Plant usually 40-100 cm. high, terrestrial; leaves numerous, closely overlapping, stiff and rigid; flowers numerous in a long spike, rather fleshy; petals erect on either side of column; lip 1-2 cm. long [8a. ovata subsp. schweinfurthii](#)
 Plant usually 20-40 cm. high, frequently epiphytic; leaves less than 15, rather thin in texture, not closely overlapping; flowers in a loose spike, less than 22 in number, thin in texture; petals set forward from column or spreading; lip 2-3 cm. long [9. kalbreyeri](#)

1. *Brachycorythis macrantha* (Lindl.) Summerh. in Kew Bull. 9: 236 (1956). *APD acc*

Gymnadenia macrantha Lindl. (1835).

Platanthera helleborina (Hook. f.) Rolfe (1898)-F.T.A. 7: 204.

Phyllomphax helleborina (Hook. f.) Schltr. (1919)-F.W.T.A., ed. 1, 2: 407.

A stout herb up to 15 in. high, the upper half bearing up to 20 green and mauve flowers.

Guin.: Fouta Djallon, Ditinn (Sept.) Chev. 18533! Manfara to Tendou, Kissidougou (July) Martine 345! Kouria to Languery (Aug.) Caille in Hb. Chev. 14652! Timbo (July) Chev. 18517! Nimba Mts. (Sept.) Schnell 1857! **S. L.:** Sugarloaf Mt. (Dec.) Sc. Elliot 4061! Jigaya (Sept.) Thomas 2738! Bagwema, Bafi R. (July-Aug.) Dawe 547! Mahinto, Tonko Limba (Sept.) Adames 195! junction Port Loko and Kambia, roads (Sept.) Adames 244! **Lib.:** Nimba Mts., 2,500 ft. (July) Leeuwenberg & Voorhoeve 4811! Sanokwele, Central Prov. (Sept.) Baldwin 7536! **N. Cam.:** Fonfaka, Bamenda, 3,000 ft. (June) Maitland 1639! Bambui, 4,800 ft. (May) Brunt 1136!

Also in **E. Cameroun**, **Gabon** and **C. African Republic**.

2. *Brachycorythis tenuior* *Rchb. f.* in Flora 48: 183 (1865). *APD acc*

Platanthera tenuior (*Rchb. f.*) *Schltr.* (1895)-F.T.A. 7: 205.

P. engleriana (*Kraenzl.*) *Rolfe* in F.T.A. 7: 204 (1898).

Diplacorchis engleriana (*Kraenzl.*) *Schltr.* (1921)-F.W.T.A., ed. 1, 2: 407.

A slender herb up to 3 ft. high; raceme 4 in. long or less, bracts not much projecting; flowers reddish, sepals with greenish tips.

Guin.: Nimba Mts., 5,300 ft. (June, July, Aug.) Schnell 1558b! 2997! 3379! Fon Massif, 5,300 ft. (July, Aug.) Schnell 3098b! 3317! **S. L.:** Bintumane Mt., 5,000-6,000 ft. (July) Bakshi 227! 230! **Iv. C.:** Nimba Mts., 2,500-5,000 ft. (Aug.) Boughey GC 18075! 18077a! 18093! **N. Nig.:** Katsina Ala (Aug.) Dalz, 835!

Generally distributed in tropical Africa, southwards to Transvaal and Natal.

3. *Brachycorythis conica* (*Summerh.*) *Summerh.* in Kew Bull. 9: 244 (1955). *APD acc*

Diplacorchis conica *Summerh.* in Kew Bull. 1938; 141.

A slender herb up to 18 in. high; with a short raceme of purple or violet flowers.

N. Nig.: Mambila Plateau, Sardauna Prov. (June) Chapman 2!

Also in **Gabon**, **Congo** and **Zambia**.

4. *Brachycorythis paucifolia* *Summerh.* in Kew Bull. 1: 123 (1948). *APD acc*

A herb 8-20 in. high with a rather short and dense flower spike.

Guin.: Man, Nimba Mts. (Apr.) Roberty 3107! Nzérékoré, Mt. Nimba, 6,000 ft. (Oct.) Jac.-Féb. 1936! Nimba Mts. (Aug.-Sept.) Schnell 1853! 3372! 3405! **S. L.:** Bintumane Pk., Loma Mts., 5,000-5,300 ft. (Aug.) Jaeger 375! 1027! 1132! Da-Oulen Mt., 5,200 ft. (Aug.) Jaeger 1278! 1327!

5. *Brachycorythis sceptrum* *Schltr.* in Beih, Bot. Centralbl. 38, II: 114 (1921). *APD acc*

Diplacorchis ashantensis *Summerh.* in Kew Bull. 1931: 378(1931); F.W.T.A., ed. 1, 2: 407.

A slender leafy herb 2 1/2-3 ft. high with white and purple flowers.

Sen.: Kaème Forest, Oussouye (Sept.) Doumlia 849! **Guin.:** Kindia (Aug.) Pobéguin 1375! **Ghana:** Amoma (July) Chipp 531! **N. Nig.:** Kagarko, Zaria (July) G, V. Summerhayes 122! Jemaa, Zaria (Aug.) King 145! Kabba (Apr.) Westwood! **S. Nig.:** Oyo (July) Sanford 1785/65!

Also in **E. Cameroun**.

6. *Brachycorythis buchananii* (*Schltr.*) *Rolfe* in F.T.A. 7: 570 (1898). *APD acc*

Brachycorythis parviflora *Rolfe* in F.T.A. 7: 202 (1898).

A herb 1-2 1/2 ft. high with a dense narrow spike of small pink, mauve or purple flowers.

N. Nig.: Mambila Plateau, 5,500 ft. (June) Chapman 4! **S. Nig.:** Obudu Plateau, Ogoja Prov., 5,300 ft. (June) Horwood in Hb. King 158!

Also in E. Africa from **Uganda** and **Kenya** Southwards to Rhodesia.

7. *Brachycorythis pleistophylla* *Rchb. f.* in Otia Bot. Hamburg. 104 (1881); F.T.A. 7: 202. *APD acc*

A herb 1-3 1/2 ft. high, with numerous very finely pointed leaves and a spike of purple, mauve or violet flowers.

N. Nig.: Ropp, Plateau Prov., 4,300 ft. (May) King 42! Sara Hills, Bauchi Prov., 5,400 ft. King s.n!

Generally in tropical Africa, southwards to [Angola](#).

8. *Brachycorythis ovata* Lindl. Gen. & Sp. Orch. 363 (1838). *APD acc*

Widespread in tropical Africa.

8a. *Brachycorythis ovata* subsp. *schweinfurthii* (Rchb. f.) Summerh. in Kew Bull. 9: 257 (1955). *APD acc*

Brachycorythis schweinfurthii Rchb. f. (1878)-F.T.A. 7: 201; F.W.T.A., ed. 1, 2: 405.

A slender leafy herb with purple-spotted flowers.

Sen.: Oussouye (Nov.) Berhaut 6549! **Iv. C.:** Kong Dist. Bouet 2560! **N. Nig.:** Lapai, Niger Prov. Onochie FHI 35386! Zungeru (June) Dalz. 561! Abinsi (June-July) Dalz. 836! Wana, 1,700 ft. (May) Brunt 405!

Eastwards to [Sudan](#) and [Kenya](#).

The only subspecies so far recorded from the area of the flora.

9. *Brachycorythis kalbreyeri* Rchb. f. in Flora 61: 77 (1878); F.T.A. 7: 201. *APD acc*

A slender herb with large lilac or violet flowers in a short raceme; [epiphytic or on rocks](#).

Guin.: Bandalcene, SW. of Pita (July) Adames 290! **S. L.:** Heddles Farm (June) Lane-Poole 376! Makump (July) Thomas 894! Ndijajula, near Njala (May, June) Deighton 700! 4315! **Lib.:** St. Paul R., Dobli Isl. (Apr.) Bequaert 173! Ganta (July) Harley 2138! Nimba Adam 21547! **W. Cam.:** Cam. Mt. 5,500-6,000 ft. (Mar.) Kalbreyer 145!

Also in [Congo](#) and [Kenya](#).

10. *Brachycorythis pubescens* Harv. Thes. Cap. 1: 35, t. 54 (1859); F.T.A. 7: 201. *APD acc*

Brachycorythis sudanica Schltr. in Beih. Bot. Centralbl. 38(2): 111(1921); F.W.T.A., ed. 1, 2: 405.

A slender herb 18-30 in. high with pink, bluish or reddish-purple, or rarely white, flowers.

Mali: Folo (May) Chev. 827! **Guin.:** Sabodougou, near Touba (July) Collenette 61! **Iv. C.:** Séguéla (Oct.) Aké Assi 5633! **Togo Rep.:** Bassari Thienemann. Fasugu (May) Bttner 647 **N. Nig.:** Lokoja Lugard! Zangeru (July) Dalz. 571! Vom Dent Young 232! Naraguta, 4,000 ft. (May) Lely 237! Tangale-Woja, Bauchi Prov. (May) G. V. Summerhayes 66! Mambila Plateau, 5,500 ft. (June) Chapman 8! **W. Cam.:** Lakom, Bamends, 6,000 ft. (Apr.) Maitland 780! Jua, Bamenda, 3,000-3,500 ft. (Apr.) Maitland 1625! Jakiri (June) Gregory 144!

Also generally in tropical Africa, southwards to Transvaal and Natal.

4. CYNORKIS

Thou. in Nouv. Bull. Sci. Soc. Philom, Paris 1: 317 (1809); F.T.A. 7: 259.

- 1** Lip 5-lobed, lowest 2 lobes reduced to teeth, other 3 lobes oblong, subacute, middle longer than laterals; leaves 1-2, lanceolate, oblanceolate or oblong, up to 10.5 cm. long and 3 cm. broad; spike dense, up to 8 cm. long; intermediate sepal 2-2.5 mm. long, spur 2-3 mm. long [1. *debilis*](#)

Lip entire, ligulate or narrowly oblong, obtuse; leaves 2-5, oblanceolate or narrowly oblanceolate, acuminate, up to 14 cm. long and 1.5 cm. broad; spike dense, usually 2-4 cm. long, but exceptionally up to 9 cm.; intermediate sepal 2-3 mm, long, spur about the same length or a little longer [2. *anacamptoides*](#)

1. *Cynorkis debilis* (Hook.f.) Summerh. in Kew Bull. 1933; 246. *APD acc*

Habenaria debilis Hook. f. (1864)-F.T.A. 7: 213.

A [terrestrial](#) herb up to 9 in. high with small white flowers with wine-coloured spotted lip.

W. Cam.: Cam. Mt., 5,000-7,000 ft. (Nov.) Mann 2127! **F. Po:** Moka, 4,550 ft. (Sept.) Wrigley & Melville 616!

Also in [S. Tomé](#) and [Congo](#).

2. *Cynorkis anacamptoides* *Kraenzl.* in Engl., Pflanzenr. Ost-Afrika C: 151 (1895), and in Engl., Bot. Jahrb. 22: 18 (1896); F.T.A. 7: 260. *APD acc*

A slender *terrestrial* herb 6-20 in. high with a dense spike of small pink or purple flowers.

W. Cam.: Jakiri, Bamenda Div. (Feb.) Hepper 1958! **F. Po:** Las Corteras (Jan.) Guinea 2125! Carretera Moka (Jan.) Guinea 1895! Mioka, 5,000 ft. (Dec.) Boughey 156!

Also in **Congo**, **Ethiopia**, **Uganda**, **Kenya**, **Tanzania**, **Angola** and **Rhodesia**.

5. HABENARIA

Willd., Sp. Pl. 4: 44(1805); F.T.A. 7: 206.

- 1 Lip superior, trilobed at apex only; sepals and ovary hairy; spur erect, somewhat recurved, 10-15 mm. long; petals shortly bidentate at apex; scape 15-30 cm. tall; leaf radical, ovate, more or less adpressed to the ground, variegated with reticulate markings [47. occidentalis](#)
Lip inferior: **2**
- 2 Petals undivided: (to p. 191)..... **3**
Petals bilobed or bipartite, the posterior lobe often adnate to the dorsal sepal: (from p. 189) **27**
- 3 Lip entire: **4**
Lip trilobed: **6**
- 4 Dorsal sepal 6.5-11 mm. long; anther canals elongated, over 2 mm. long; stigmas free: **5**
Dorsal sepal 4-6 mm. long; anther canals very short; posterior half of petal infolded; stigmas usually connate [10. zambesina](#)
- 5 Leaves narrowly lanceolate, up to 18 cm. long and 5 cm. broad; petals ovate or elliptical, obtuse or rounded, posterior margin slightly infolded; lip 9-12.5 mm. long; anther canals straight, 2-3 mm. long [8. leonensis](#)
Leaves broadly or oblong-lanceolate, up to 12 cm. long and 4 cm. broad; petals broadly lanceolate, acute, posterior margin, not infolded; lip 11-13 mm. long; anther canals much incurved, 3.5-4 mm. long [9. stenochila](#)
- 6 Side lobes of lip pectinate or fimbriate: **7**
Side lobes of lip entire: **11**
- 7 Flowers small; dorsal sepal 5-7 mm. long; lip 1-1.5 cm. long, middle lobe flabellate, emarginate with a central apiculus, front margin pectinate, spur 2-3 cm. long; plant 7-15 cm. high, 1-2-flowered; leaves linear-lanceolate, 1-4 cm. long, 2-4 mm. broad [21. jacobii](#)
Flowers large; dorsal sepal over 12 mm. long; lip at least 2 cm. long, middle lobe linear or linear-oblong, entire, subacute; plant 15-70 cm. high, usually over 4-flowered; leaves 5-25 cm. long, 0.75-7 cm. broad: **8**
- 8 Side lobes of lip semi-ovate or fan-shaped, shortly pectinate; spur over 5 cm. long; anther-loculi approximate; leaves broadly oblong-lanceolate, 3-7 cm. broad: **9**
Side lobes of lip linear or slightly broadened upwards, divided into many narrow segments on the outer edge; anther loculi distant from one another at the ends of the narrow ribbon-shaped connective; leaves linear-lanceolate, 0.75-3 cm. broad: **10**
- 9 Lip about 2.5-4 cm. across, lobes divergent; side lobes fan-shaped, deeply cordate on each side of claw; spur 12-15 cm. long [19. englerana](#)
Lip about 2-5 cm. across, lobes nearly parallel; side lobes semi-ovate, bases at right angles with claw; spur about 5 cm. long [20. prionocraspedon](#)
- 10 Spur 1.2-2.2 cm. long; side lobes of lip only slightly widened upwards, threadlike segments rising pinnately; receptive portions of stigmas stalked; anther canals 3-5 mm. long [23. mannii](#)
Spur 3.5-7.5 cm. long; side lobes of lip considerably widened upwards, threadlike segments arising almost palmately; receptive portions of stigmas sessile; anther canals only 2 mm. long [24. jaegeri](#)
- 11 Leaf suborbicular, radical, closely appressed to the ground, 2-6.5 cm. broad; perianth-segments ovate-lanceolate, acuminate, 7-10 mm. long; lip-segments narrowly lanceolate, of equal length, the middle one broader; spur 3-6 cm. long [48. lelyi](#)
Leaves cauline, or if radical neither suborbicular nor closely appressed to the ground: **12**
- 12 Column elongated, over 13 mm. high, the anther at the apex; anther-canals free from the side lobes of the rostellum; stigmas cushion-like, partially confluent; leaves in a tuft at the base, lanceolate, up to 25 cm. long; lobes of lip filiform; dorsal sepal 1.8-3 cm. long [7. macrandra](#)
Column short, less than 6 mm. high; anther-canals united to the side lobes of the rostellum; stigmas stalked or

- nearly sessile, but not cushion-like nor confluent: 13
- 13 Spur 4 cm. or more long; dorsal sepal 8-12 mm. long: 14
- Spur less than 3 cm. long; dorsal sepal up to 6.5 mm. long: 16
- 14 Epiphytic plant (rarely in humus); leaves lanceolate or narrowly ovate, up to 30 cm. long, 2-7 cm. broad; spur 6-10 cm. long; inflorescence rather dense, usually 10-30-flowered [11. procera](#)
- Terrestrial plants; leaves lanceolate or narrowly lanceolate, 0.5-4 cm. broad; inflorescence rather lax, almost always less than 12-flowered: 15
- 15 Leaves linear- or narrowly lanceolate, up to 1 cm. broad; spur 4-5 cm. long; growing on rocks by streams [12. weilerana](#)
- Leaves narrowly lanceolate or lanceolate, 1-4 cm. broad; spur 5-12 cm. long; growing in humus or grassy places among rocks [13. gabonensis](#)
- 16 Leaves in a tuft at the base of the stem with often a smaller leaf on the scape above: 17
- Leaves at intervals along stem, but often closer in lower part: 18
- 17 Plant 15-55 cm. high; leaves ascending, elliptical-lanceolate, shortly stalked, 4-14 cm. long, 1.5-3.5 cm. broad; inflorescence 5-20-flowered; dorsal sepal 5-7 mm. long; lobes of lip all narrowly linear; spur decurved, inflated in distal half [6. buntingii](#)
- Plant up to 15 cm. high; leaves spreading or more or less recurved, broadly linear or linear-lanceolate, 1-2.5 cm. long, 2-4 mm. broad; inflorescence 1-2-flowered; dorsal sepal 4-5.5 mm. long; side lobes of lip narrow, middle lobe suddenly fan-shaped from a narrow base; spur pendulous, almost straight, scarcely inflated [22. parva](#)
- 18 Spur 1-1.5 mm. long, shorter than the lip; anther canals very short: 19
- Spur 10 mm. or more long, equalling or longer than the lip: 20
- 19 Lip broad, 2-2.5 mm. long, shortly trilobed, three lobes about equal in length, middle lobe triangular with an elevated keel; stigmas nearly sessile; leaves elliptic-lanceolate, acuminate, up to 10 cm. long and 4 cm. broad; rostellum small, tooth-like; spike slender, up to 1 cm. diam.; dorsal sepal 2-2.5 mm. long [5. microceras](#)
- Lip longer than broad, 7.5-9.5 mm. long, the middle lobe much longer than the spreading laterals, ligulate, base of lip deeply cordate with 2 rounded auricles; stigmas oblong or club-shaped, 1.5-2 mm. long; leaves narrowly lanceolate, acute, up to 25 cm. long and 2 cm. broad; rostellum large, folded, shield-like when flattened, spike rather stout, 1.5-3 cm. diam.; dorsal sepal 4-6.5 mm. long [18. peristyloides](#)
- 20 Spur almost filiform, not much thickened near the apex, always much longer than the lip; dorsal sepal up to 5 mm. long; flowers numerous in a long spike: 21
- Spur stouter, more or less markedly club-shaped near apex: 24
- 21 Petals ovate or narrowly ovate; segments of lip ligulate or narrowly oblong, up to 5.5 mm. long; middle lobe of rostellum short, hooded: 22
- Petals linear or narrowly lanceolate; segments of lip linear, up to 9 mm. long; middle lobe of rostellum narrow, elongated, more or less acute: 23
- 22 Leaves 1 or 2 near base of stem, with several much smaller bract-like ones above; pedicels (and ovaries) more or less appressed to rhachis so that spike is very narrow, 1 cm. diam.; dorsal edge of petals folded inwards; side lobes of rostellum very short, middle lobe obtuse, clearly hooded; side lobes of lip up to 2.5 mm. long [1. attenuata](#)
- Leaves 4-8 all along stem below inflorescence; pedicels (and ovaries) arcuate so that spike is 1.5-2.5 cm. diam.; dorsal edge of petal not folded inwards; side lobes of rostellum relatively long and narrow, middle lobe very short, slightly hooded; side lobes of lip 2.5-5.5 mm. long [2. bracteosa](#)
- 23 Leaves oblong or narrowly lanceolate, about 5-6 times as long as broad, up to 10 cm. long; stigmas papillose underneath; rostellum middle lobe without tall keel [3. filicornis](#)
- Leaves linear, 10-20 times as long as broad, up to 17 cm. long; stigmas smooth underneath; rostellum middle lobe with tall keel [4. chlorotica](#)
- 24 Dorsal sepal 2.5-4 mm. long; spur shortly bifurcate at apex, about 7 mm. long; leaves linear to lanceolate-linear, at least 8 times as long as broad, 7-13 cm. long, 5-10 mm. broad; inflorescence 4-17-flowered; anther-loculi divergent [17. nigrescens](#)
- Dorsal sepal 5-7 mm. long; spur rounded or entire at apex, not bifurcate; leaves lanceolate or oblong-lanceolate, at most 7 times as long as broad: 25
- 25 Leaves longest immediately below the inflorescence, lower half of stem almost covered by 4-5 rather loose sheaths; leaves lanceolate, 2.5-8 cm. long, 7-12 mm. broad; lower bracts longer than the flowers; petals curved lanceolate; side lobes of lip shorter than middle lobe; spur about equalling or longer than lip [16. nigerica](#)
- Leaves all along stem or in the lower part only, basal sheaths very inconspicuous; lower bracts shorter than the flowers; petals obovate, rounded; side lobes of lip equalling or longer than middle lobe; spur considerably longer than lip: 26
- 26 Stigmas club-shaped; leaves mostly near base of the stem, up to 9 cm. long and 1-7 cm. broad; spur much dilated

- at apex; anther loculi some distance apart on the broadened connective [14. obovata](#)
- Stigmas awl-shaped; leaves all along the stem, 5-15 cm. long, 2-4 cm. broad; spur moderately dilated at apex;
anther loculi contiguous [15. dinklagei](#)
- 27** Leaves borne along the stem, neither orbicular nor adpressed to the ground: **28**
- Leaves 1-2, radical, suborbicular or heart-shaped and adpressed to the ground: **49**
- 28** Spur 5 cm. or more in length: **29**
- Spur less than 5 cm. in length: **32**
- 29** Lobes or lip and anterior petal-lobe lanceolate; anther canals much shorter than stigmas; lateral sepals not rolling
up lengthwise; spur 13-17 cm. long; dorsal sepal 11-15 mm. long [46. walleri](#)
- Lobes of lip and anterior petal-lobe linear or linear-lanceolate, latter horn-like; anther canals slightly longer than
stigmas; lateral sepals rolling up lengthwise; dorsal sepal over 15 mm. long: **30**
- 30** Anterior petal-lobe lanceolate-linear, 2-3.5 cm. long; spur up to 7 cm. long, swollen at apex [42. holubii](#)
- Anterior petal-lobe filiform or narrow-linear, 4.5-7.5 cm. long; spur 5-17 cm. long: **31**
- 31** Spur 12-17 cm. long, moderately swollen near end, tapering again towards apex itself [43. cirrhata](#)
- Spur 5-8 cm. long, suddenly swollen at apex to form a rounded obtuse sac [44. laurentii](#)
- 32** Anterior petal-lobe slender, fleshy, subulate, rather like a long curved horn, 2-4 times as long as the erect dorsal
sepal; dorsal sepal over 5 mm. long; spur much swollen at apex; stigmas suddenly broadened at apex; leaves
mostly in lower part of stem, 1-3 cm. broad: **33**
- Anterior petal-lobe not as above: **34**
- 33** Stigmas 8-12 mm. long; dorsal sepal 11-17 mm. long; spur 3-5 cm. long; side lobes of lip very slender, entire,
longer than the anther canals [41. clavata](#)
- Stigmas 4.5-6 mm. long; dorsal sepal 6-9 mm. long; spur 1.5-2.5 cm. long; side lobes of lip narrowly lanceolate,
often with several comb-like teeth or threads on the outside edge [45. cornuta](#)
- 34** Dorsal sepal 1 cm. long or more: **35**
- Dorsal sepal less than 9 mm. long: **37**
- 35** Petal-segments linear or almost filiform; spur less than 2 cm. long; leaves 1.5-7 cm. broad, up to 12 cm. long: **36**
- Petals divided two-thirds down, posterior segment lanceolate, anterior curved, oblong or linear, much shorter or
equal in length; spur 3-4 cm. long; leaves narrower, 1-2 cm. broad, up to 6 cm. long [40. phylacochaira](#)
- 36** Petals divided nearly to base, segments glabrous; side lobes of lip longer than the middle lobe, side lobes
spreading, middle lobe hanging vertically downwards, narrow; leaves in a group just above the middle of the
stem; stigmas not swollen at apex; inflorescence up to 10-flowered [26. barrina](#)
- Petals divided two-thirds down, segments ciliate; side lobes of lip shorter than the middle lobe; leaves in lower
half of stem; stigmas club-shaped; inflorescence 15-70-flowered [25. longirostris](#)
- 37** Leaves lanceolate, oblong-lanceolate or oblanceolate, 1.5-5 cm. broad, mostly in central part of stem, lower part
of stem more or less covered by sheaths; stigmas obliquely club-shaped or scarcely thickened upwards: **38**
- Leaves lanceolate, linear-lanceolate or linear, never more than 2 cm. broad and usually much narrower, when
lanceolate the largest near the base of the stem: **40**
- 38** Lamina of leaves lanceolate or oblong-lanceolate, the basal part broadest and usually more or less enfolding the
stem, up to 14 cm. long, 1.5-3.5 cm. broad; lower leafless part of stem 5-10 cm. long, sheaths loose, funnel-
shaped; dorsal sepal 4.5-6.5 mm. long; inflorescence dense-flowered; spur 10-15 mm. long [27. papyracea](#)
- Lamina of leaves oblanceolate, narrowing gradually to the base, 5-16 cm. long, 1.5-5 cm. broad; lower leafless
part of the stem 5-20 cm. long. sheaths tight; inflorescence rather loose-flowered; dorsal sepal 3.5-5.5 mm.
long: **39**
- 39** Pedicel and ovary bending out from rhachis so that flowers are nearly horizontal, inflorescence 3-5 cm. diam.;
spur 1.2-2.5 cm. long, slightly thickened in distal half; anterior petal-lobe equalling, shorter than or slightly
longer than the posterior [28. buettnerana](#)
- Pedicel and ovary diverging from rhachis at about 45°, flowers bending forward slightly or vertical, inflorescence
2-3 cm. diam.; spur 9-16 mm. long, thickest in centre and tapering towards both ends, much incurved; anterior
petal-lobe longer and narrower than the posterior [29. malacophylla](#)
- 40** Anterior petal-lobe shorter and narrower than posterior; stigmas club-shaped, not obliquely truncate-capitate at
apex; dorsal sepal erect, about 4 mm. long; inflorescence dense, many-flowered, about 2 cm. diam.; leaves
lanceolate or narrowly lanceolate, in lower part of stem; spur descending, slightly inflated in distal half, 8-10
mm. long [30. bongensium](#)
- Anterior petal-lobe longer than or rarely equalling the posterior, usually broader; stigmas slender in lower part,
obliquely truncate-capitate at apex; dorsal sepal more or less reflexed; leaves usually linear or linear-lanceolate:
..... **41**
- 41** Spur spirally twisted in middle and sharply incurved, much swollen at apex, 9-13 mm. long; lobes of lip narrowly

- linear, middle lobe 9-11 mm. long, longer than laterals [31. genuflexa](#)
- Spur straight or slightly curved, not spirally twisted or if so not incurved: **42**
- 42** Petals divided for two-thirds of the length only, anterior segment narrower than posterior; spur very slender, slightly incurved, not thickened at end, 5-7 mm. long; lobes of lip narrowly linear; stigmas 6-7 mm. long .. [32. dalzielii](#)
- Petals divided almost to the base; lateral sepals obliquely obovate, laterally apiculate; lobes of lip narrowly linear, not very acute, middle distinctly longer than laterals: **43**
- 43** Bracts equalling or longer than pedicel + ovary; dorsal sepal 5-8 mm. long; spur 15-20 mm. long, thickened in lower half, rather acute [36. huillensis](#)
- Bracts considerably shorter than pedicel + ovary: **44**
- 44** Anterior segment of petals about the same length as, or shorter than, the posterior segment; spur 6-8 mm. long: **45**
- Anterior segment of petals much longer and usually broader than the posterior segment; spur 1-3 cm. long: ... **46**
- 45** Posterior petal-segment much broader than anterior, about the same length; dorsal sepal 5-6 mm. long; inflorescence often rather lax, 1.5-2.5 cm. diam.; leaves up to 13 cm. long and 8 mm. broad; anther canals 4-5 mm. long [33. angustissima](#)
- Posterior petal segment narrower and longer than anterior; dorsal sepal 3-4 mm. long; inflorescence dense, 1.5-2 cm. diam.; leaves up to 23 cm. long and 1 cm. broad; anther canals about 2.5 mm. long [35. pauper](#)
- 46** Stamines tongue-shaped, entire; leaves rather short, 4-10 cm. long; stigmas obliquely truncate at apex; spur 18-22 mm. long, distinctly swollen in the lower half and narrowly club-shaped [37. linguiformis](#)
- Stamines bilobed; leaves longer, up to 30 cm. long: **47**
- 47** Spur equal in thickness nearly to apex where there is a very slight swelling, 12-21 mm. long; stamines large, deeply bilobed with a distinct stalk; racemes rather densely many-flowered [38. chirensis](#)
- Spur distinctly club-shaped and swollen in the apical half or third; stamines about 1 mm. long, sessile: **48**
- 48** Leaves linear, up to 20 cm. long and 8 mm. broad; ovary 5-6 mm. long, much shorter than the long slender pedicel; spur 1-3 cm. long, swollen in the apical third; inflorescence rather lax [34. ichneumonea](#)
- Leaves narrowly lanceolate, up to 10 cm. long, 10-14 mm. broad; ovary 8-9 mm. long, often nearly as long as the pedicel; spur 10-11 mm. long, swollen in the apical half [39. maitlandii](#)
- 49** Rhachis and flowers hairy; leaf on flowering stem 1, rarely with a much smaller additional one near the base of the scape or young flowering plants with 2 leaves; dorsal sepal 5-8 mm. long; scape up to 45 cm. high: **50**
- Rhachis and flowers glabrous; leaves on adult plants 2; dorsal sepal 8 mm. long or more; spur 5-20 cm. long; scape 30-70 cm. high: **51**
- 50** Spur about 6 cm. long; leaf about 3-4 cm. long and broad, margins densely hairy, otherwise almost glabrous; dorsal sepal about 6 mm. long; segments of lip and anterior petal-segments filiform [49. lecardii](#)
- Spur 10-14 mm. long; leaf (or leaves) (1.5-)4-12 cm. long, including basal lobes, (1-)4-11 cm. broad, margins hairy, often with scattered long hairs on upper surface; dorsal sepal 5-8 mm. long; segments of lip and anterior petal-segment linear or very narrowly strap-shaped [50. keayi](#)
- 51** Segments of lip and anterior petal-segments oblanceolate, up to 2 cm. long, 2.5-9 mm. broad; leaves 3-8 cm. long; scape almost covered with large sheaths; stigmatic arms thick all the way up, truncate at apex, 3-5 mm. long [51. macrura](#)
- Segments of lip and anterior petal-segments filiform, 2.5-4.5 cm. long; leaves 4-16 cm. long, 9-20 cm. broad; sheaths on scape small, distant; stigmatic arms clavate-capitate from a very slender base, 6-10 mm. long ... [52. armatissima](#)

1. Habenaria attenuata Hook. f. in J. Linn. Soc. 7: 221(1864); F.T.A. 7: 216; F.W.T.A., ed. 1, 2: 410 (excl. syn. *H. clarencensis* Rolfe, partly). *APD acc*

A slender **terrestrial** herb up to 18 in. high with small green flowers in a narrow spike.

W. Cam.: Cam. Mt., 7,000 ft. (Nov.) Mann 2188! 8,000-10,000 ft. Johnston 30! 33! **F. Po:** Clarence Peak, on summit, 10,000 ft. (Dec.) Mann 645 (partly)!

Also in **Congo**, **Ethiopia** and **Uganda** (Mt. Elgon).

2. Habenaria bracteosa Hochst. ex A. Rich. Tent. Fl. Abyss. 2: 292 (1851); F.T.A. 7: 217. *APD acc*
Habenaria clarencensis Rolfe (1898)-F.T.A. 7: 216, partly.

An erect leafy **terrestrial** plant up to 3 1/2 ft. high with a long dense spike of green or greenish-yellow flowers.

W. Cam.: Preuss 970! Lakom, Bamenda, 6,000 ft. Maitland! **F. Po:** Clarence Peak, on summit, 10,000ft. (Dec.) Mann 645 (partly)!

Also in **Ethiopia**, **Uganda**, **Kenya** and **Tanzania**.

3. **Habenaria filicornis** *Lindl.* Gen. & Sp. Orch. Pl. 318 (1835); F.T.A. 7: 216; Chev. Bot. 620; F.W.T.A., ed. 1, 2: 410 (excl. Dalz. 232). *APD acc*

A slender herb up to 18 in. high; flowers small, green, in an open spike; in damp grassy plains, etc.

Iv. C.: Kodiokoffi (Aug.) Chev. 22345. **Ghana:** Thonning 58! Nandom (Sept.) Hall CC 779! Lawra to Wa (Sept.) Hall CC 632! **N. Nig.:** Jos Plateau (June) Lely P330! Hephram to Ropp, 4,600 ft. (July) Lely 374! Vom, 3,000-4,500 ft. Dent Young!

Also in **Ethiopia**, **Sudan**, **Uganda**, **Kenya**, **Tanzania**, **Angola**, **Congo**, **Malawi** and **Rhodesia**.

4. **Habenaria chlorotica** *Rchb. f.* in Flora 48: 178 (1865); F.T.A. 7: 217.

APD: Synonym of Habenaria filicornis Lindl.

A slender herb up to 2 ft. high, with long narrow leaves; flowers small, green, in an open spike; in marshy or damp grassy places.

Guin.: Timbi, Fouta Djallon (June) Adam 14580! Labré (July) Adames 304! **S. L.:** N. of Loma Mansa, Loma Mts., (Nov.) Jaeger 578! **N. Nig.:** Zungeru (Sept.) Dalz. 232! Dorofi, Mambila Plateau, 5,500 ft. (June) Chapman 19!

Eastwards to **Uganda** and **Kenya**, southwards in E. Africa to Natal, also **Angola**.

5. **Habenaria microceras** *Hook. f.* in J. Linn. Soc. 7: 221 (1864); F.T.A. 7: 213. *APD acc*

Peristylus preussii (*Kraenzl.*) *Rolfe* in F.T.A. 7: 199(1898).

A leafy terrestrial or epiphytic herb up to 2 1/2 ft. high; flowers small, green, in a narrow spike 2-10 in. long.

W. Cam.: Cam, Mt., 7,000-10,000 ft. (Sept.-Nov.) Mann. 2116! Johnston 31! Preuss 967! **F. Po:** Moka, 4,600 ft. (Sept.) Melville 417!

6. **Habenaria buntingii** *Rendle* Cat. Talb. 109 (1913).

APD: Synonym of Habenaria physuriformis Kraenzl.

Terrestrial up to 18 in. high; leaves in a basal tuft; flowers white or pale pinkish green; in forests or shady places.

S. L.: Sennihun to Gene (Nov.) Deighton 305! Makene (Jan.) Deighton 3610! **Lib.:** Tawata, Boporo (Nov.) Baldwin 10306! Nekabozu, Vonjama (Oct.) Baldwin 10038! Dzipla, Webo (July) Baldwin 6307! Toué Tié-Tié (Dec.) Adam 16318! Ganta (Dec.) Harley 1846! **Iv. C.:** Péhiri to Kopréagou, Sassandra R. (Nov.) de Wilde 3309! **Ghana:** Aburi Hills (Oct.), Johnson! Santrokofi, Hohoe. (Oct.) Thompson 1489!

Also in **Gabon** and **Congo**.

7. **Habenaria macrandra** *Lindl.* in J. Linn. Soc. 6: 139 (1862); Cat. Talb. 109. *APD acc*

Podandria macrandra (*Lindl.*) *Rolfe* in F.T.A. 7: 206 (1898).

A terrestrial herb to 2 ft. high, with thick woolly roots, a tuft of radical leaves and a lax raceme of star-like white and pale green flowers; in forests.

Guin.: Nimba Mts., in summit forest, 4,000 ft. (Sept.) Schnell 3514! **S. L.:** Konina (Nov.) Glanville 122! Sennihun to Gene (Nov.) Deighton 306! Bedu Falls, Kailahun (Nov.) Deighton 4671! Also in **Gabon** and **Uganda**.

12. **Habenaria weilerana** *Schltr.* in Engl., Bot. Jahrb. 38: 149 (1906); Cat. Talb. 147. *APD acc*

Herb up to 1 ft. high, with leafy stem and white flowers; among rocks by streams.

S. Nig.: Ndebbige, Oban (Oct.) Talbot 844! **W. Cam.:** Bibundi (Nov.) Weiler! Mildbr. 10660! Tsoni, Cam, Mt. (Nov.) Jungner 179!

Also in **Gabon**.

13. **Habenaria gabonensis** *Rchb. f.* in Bot. Zeit. 10: 934 (1852); F.T.A. 7: 220. *APD acc*

A terrestrial herb up to 2 1/2 ft. high, leafy in lower part of stem; flowers white; in humus among rocks.

S. L.: Kafoko (Sept.) Thomas 2115! **Lib.:** Wanau (July) Harley 2039! **iv. C.:** Mi. Niénokué (Aug.) Schnell 1650! Issia, Rock (Aug.) de Wilde 429! **N. Nig.:** Gembu, Mambila Plateau, 5,500 ft. (July) Chapman 22! **W. Cam.:** Mamfe (Sept.) Gregory 322! **F. Po:** Ureka (Feb.) Guinea 2497!

Also in **E. Cameroun**, **Principe**, **Gabon** and **Congo**.

14. **Habenaria obovata** *Summerh.* in Kew Bull. 1932: 191. *APD acc*

Roeperocharis occidentalis *Kraenzl.* in Engl., Bot. Jahrb. 17: 67 (1893).

A **terrestrial** herb up to 18 in. high; flowers small, green, in a dense spike.

W. Cam.: Cam. Mt., 7,000-10,000 ft. (Sept.-Dec.) Maitland 804! Kingsley! Johnston 29! Preuss 980!

15. **Habenaria dinklagei** *Kraenzl.* in Engl., Bot. Jahrb. 51: 374 (1914). *APD acc*

A **terrestrial** herb 12-18 in. high with leafy stem: leaves broadly lanceolate, acute; flowers white in short spike.

Lib.: Sinoe (Nov.) Dinklage 2330! **S. Nig.:** Idanre, Ondo (Aug.) Jones FHI 20721!

16. **Habenaria nigerica** *Summerh.* in Kew Bull. 7: 575 (1953). *APD acc*

A **terrestrial** herb 6-12 in. high; flowers yellowish green in a leafy bracteate spike.

N. Nig.: Mando F.R., Zaria (July) Keay FHI 25993! 25986! Zongon Katab, Zaria (June, July) G. V. Summerhayes 109! 128! Mongu F.R., Plateau Prov. (Aug.) King 29!

17. **Habenaria nigrescens** *Summerh.* in Kew Bull. 20: 165 (1966). *APD acc*

A **terrestrial** herb 9 in.-2 ft. high; flowers pale or yellow-green in a short spike.

W. Cam.: Bamenda-Nkwe to Bafut-Ngemba (May, July) Daramola FHI 41177! 41568! Bafut-Ngemba F.R. (July) Brunt 774! Lowe 72!

18. **Habenaria peristyloides** *A. Rich.* in Ann. Sci. Nat. sér. 2, 14: 270, t. 17, flg. III (1840); F.T.A. 7: 214. *APD acc*

Habenaria cardiochila *Kraenzl.* (1892)-F.T.A. 7: 214.

Habenaria rendlei *Rolfe* in F.T.A. 7: 213 (1898).

A **terrestrial** rather leafy herb up to 4 ft. high with numerous green or yellowish green flowers in long dense spikes.

N. Nig.: Kan lyaka, Mambila Plateau, 5,500 ft. (July) Chapman 3! **S. Nig.:** Obudu Plateau, 5,500 ft. (Aug.) Stone 54!

Also in **eastern Congo**, **Ethiopia**, **Sudan**, **Uganda**, **Kenya** and **Tanzania**.

19. **Habenaria englerana** *Kraenzl.* in Engl., Bot. Jahrb. 17: 68, t. VA (1893); F.T.A. 7: 222. *APD acc*

Habenaria hunteri *Rolfe* in Kew Bull. 1918: 238.

A herb up to 2 ft. high with lanceolate acute leaves up to the inflorescence; flowers large, white.

Guin.: Guéchédou (July) Jac.-Fél. 1022! **S. L.:** Kimadougou, Loma Mts. (Aug.) Jaeger 933! **Ghana:** Hunter! Southern Scarp F.R., Obomen (July) Darko FH 5091! **Togo Rep.:** Bismarckberg (Apr.) Büttner 692! **N. Nig.:** Kagoro R., Jemaa, Zaria Prov. (June) King 186! **S. Nig.:** Ibadan (July) Westwood 268! Mt. Orosun, Idanre Hills E. W. Jones FHI 25342!

20. **Habenaria prionocraspedon** *Summerh.* in Kew Bull. 1932: 342. *APD acc*

A **terrestrial** herb with lanceolate acute leaves all up the stem, and a dense raceme of rather large white flowers.

S. Nig.: Boshi, Ogoja, 3,500 ft. Rosevear 61/29!

21. **Habenaria jacobii** *Summerh.* in Kew Bull. 1935: 196. *APD acc*

A **terrestrial** herb about 6 in. high with narrow leaves and 1 or 2 white and green flowers.

Guin.: Kindia (Aug.) Jac.-Fél. 140! 7040! Passo, Pita (July) Adames 292! **S. L.:** Kponkponto to Waie, Sule Mts, (July) Marmo 158!

22. *Habenaria parva* (Summerh.) Summerh. in Kew Bull. 1938: 148. *APD acc*

Cynorchis parva Summerh. in Kew Bull. 1932: 338; F.W.T.A., ed. 1, 2: 407.

A small ground orchid 2-6 in. high with 1 or 2 green and white flowers [grassy plains or open woodland](#).

Guin.: Timbo (July) Pobéguin 1592! **N. Nig.:** Jos Plateau (June) Lely P 337! Hephama to Ropp, 4,600 ft. (July) Lely 361! Randa (July) Hepburn 121! Mando F.R., Zaria (July) Keay FHI 25989! Zongon Katab, Zaria (June) G. V. Summerhayes 111! **W. Cam.:** Bum, Bamenda, 4,000 ft. (May, June) Maitland 1398! 1669!

Also in **C. African Republic**.

23. *Habenaria mannii* Hook.f. in J. Linn. Soc. 7: 222 (1864); F.T.A, 7: 225. *APD acc*

An erect herb up to 2 ft. high with a leafy stem and a dense raceme of a few to 25 large green or whitish green flowers.

N. Nig.: Zonkwa, Zaria (July) G. V. Summerhayes 132! Vom, 3,000-4,500 ft. Dent Young 234! Naraguta and Jos (Sept.) Lely 560! Jos (July, Aug.) Keay FHI 20184! Lawlor & Hall FHI 45581! **S. Nig.:** Obudu Cattle Ranch, Ogoja Prov. (Aug.) Stone 82! **W. Cam.:** Cam. Mt., 5,000-9,000 ft. (Nov., fr. Feb.) Mann 2119! Basenako-Lakom, Bamenda, 6,000 ft. (June) Maitland 1617! Nchan, Bamenda, 5,000 ft. (June) Maitland 1643b! Bafut-Ngemba F.R. (Aug.) Ujor FHI 29956: Manenguba Mts., 6,000 ft. (June) Gregory 300! **F. Po:** Moka (Sept.) Tessmann 2829! Wrigley & Melville 623!

Also in **E. Cameroun**.

24. *Habenaria jaegeri* Summerh. in Kew Bull. 1: 124 (1948). *APD acc*

An erect [terrestrial](#) herb 1-2 ft. high with a leafy stem and a broad raceme of up to 12 large white flowers.

Guin.: Fon Massif, on crest, 5,300 ft, (June-Aug.) Schnell 3100! 3316! **S. L.:** Bintumane Peak, Loma Mts. (Aug.) Jaeger 976! Koya Mt., Bafodia, Koinadugu, 2,400 ft. (Aug.) Haswell 73!

25. *Habenaria longirostris* Summerh. in Kew Bull. 1932: 192. *APD acc*

An erect leafy herb 1-3 ft. high; flowers fragrant, green and white, in a many-flowered raceme; [grassy plains and open woodland](#).

Port. G.: Gabu, near Oco Esp. Santo 2! **N. Nig.:** Naraguta (July, Aug.) Lely 462! Keay FHI 20170! Vom, 3,000-4,500 ft. Dent Young Wana (Aug.) Hepburn. 120! Jarawa & Gumau, Bauchi Prov. (July, Aug.) G. V. Summerhayes 16! 22! Tangale Waja, Bauchi Prov. (Sept.) G. V. Summerhayes 74!

Also in **Uganda**.

26. *Habenaria barrina* Ridl. in Bol. Soc. Brot. 5: 202, t. D, fig. B (1887); F.T.A. 7: 229, in syn. under *H. thomana* Rchb. f.; Cat. Talb. 147. *APD acc*

A leafy [terrestrial](#) herb up to 18 in. high with a few-flowered loose racemes, [in forests](#).

Iv. C.: Keéta, Cavally Basin (July) Chev. 19364! **S. Nig.:** Ilaro (Sept.) Punch! Ibadan (Sept.) Ahmed & Chizea FHI 19779! Mamu F.R., Onitsha Dist. (Aug.) Ajayi FHI 26974!

Also in **S. Tomé and Congo**.

27. *Habenaria papyracea* Schltr. in Engl., Bot. Jahrb. 53: 498 (1915). *APD acc*

A [terrestrial](#) herb 1-2 1/2 ft. high with leafy stem and numerous small green flowers in a rather dense spike.

N. Nig.: Mongu F.R., Plateau Prov. (Nov.) King 100! Naraguta F.R., Plateau Prov. (Sept.) King 100a! Jos (Sept.) King 100b! Batten-Poole 345! 354!

Also in **Congo, Tanzania, Zambia and Rhodesia**.

28. *Habenaria buettnerana* *Kraenzl.* in Engl., Bot. Jahrb. 16: 68 (1892); F.T.A. 7: 237. *APD acc*

Habenaria graminea A. Chev., Bot. 620, name only, partly.

A leafy herb up to 31/2 ft. high with a long rather lax raceme of small green flowers; in forests.

Port. G.: Tulacunda. (Oct.) Esp. Santo 2218! Cambasse to Geba (Aug.) Esp. Santo 3297! Bafata to Tantom Cossé (Sept.) Esp. Santo 3346! **Guin.:** Mamou (Aug.) Pobéguin 1676! Also in **Sudan**, **Uganda**, **Kenya** and **Angola**.

37. *Habenaria linguiformis* Summerh. in Kew Bull. 1932: 340. *APD acc*

An erect herb 12-18 in. high; flowers green and white.

N. Nig.: Zongon Katab, Zaria Prov. (June) G. V. Summerhayes 110! Bukuru to Hephram, 4,300 ft. (July) Lely 343a! Kuru, Plateau Prov. (July) G. V. Summerhayes 160! N'gell, Plateau Prov. (June) King 27!

38. *Habenaria chirensis* Rchb.f. Otia Bot. Hamburg. 99 (1881); F.T.A. 7: 238. *APD acc*

An erect herb up to 3 ft. high; flowers green and white in rather dense racemes; **in grasslands.**

N. Nig.: Jos Plateau (June) Lely P379! King 28! Bukuru to Hephram, 4,300 ft. (July) Lely 343! Kuru Station, Plateau Prov. (July) G. V. Summerhayes 148!

Also in **E. Cameroun**, **Ethiopia**, **Uganda**, **Kenya** and **Tanzania**.

39. *Habenaria maitlandii* Summerh. in Kew Bull. 1932: 341. *APD acc*

A **terrestrial** herb up to 1 ft. high; flowers white in short racemes.

W. Cam.: Nchan, Bamenda, 5,600 ft. (June) Maitland 1386!

40. *Habenaria phylacochaira* Summerh. in Kew Bull. 1932: 190. *APD acc*

An erect herb up to 18 in. high; flowers green and white in a short few-flowered raceme.

N. Nig.: Ropp, 4,600 ft. (July) Lely 451! Vom, 3,000-4,500 ft. Dent Young! Heipan, 4,000 ft. (July) G. V. Summerhayes 150! King 16!

[It is possible that these specimens are abnormal examples of *H. clavata* (Lindl.) Rchb. f. or some similar species.]

41. **Habenaria clavata** (Lindl.) Rchb. f. in Flora 48: 180 (1865). *APD acc*

APD: *Synonym of Habenaria holubii Rolfe*

Bonatea clavata Lindl. in Hook. Comp. Bot. Mag. 2: 208 (1837).

An erect herb 1-2 1/2 ft. high with leafy stem and rather loose raceme of green or greenish-white flowers; in grassland and open woodland.

N. Nig.: Zonkwa, Zaria (July) G. V. Summerhayes 134!

Also in **E. Cameroun, Congo, Tanzania, Rhodesia** and southwards to Cape Province.

42. **Habenaria holubii** Rolfe in F.T.A. 7: 249 (1898), *H. valida*. Schltr. in Engl., Bot. Jahrb. 38: 148 (1906). *APD acc*

An erect herb 1-2 1/2 ft. high with leafy stem and rather loose raceme of large greenish-white flowers; in grassland and open woodland.

Port. G.: Gabu, Nova Lamego to Canjadude (Oct.) Esp. Santo 3538! **Togo Rep.:** Quamikrum (Mar.) Thienemann.! **N. Nig.:** Zungeru & Lokoja Lugard! Zungeru (Aug.) Dalz. 229! Yelwa, Zaria (Aug.) Keay FHI 28015! Mando F.R., Zaria (Aug.) Keay FHI 28002! Abinsi (Oct., Nov.) Dalz. 839!

Also in **C. African Rep., Uganda, Kenya, Tanzania, Congo, Angola** and the Zambesi valley.

43. **Habenaria cirrhata** (Lindl.) Rchb. f. in Flora 48: 180 (1865); F.T.A. 7: 248. *APD acc*

An erect herb 1 1/2-4 1/2 ft. high with leafy stem and loose raceme or large greenish-white flowers; in grasslands.

Guin.: Bonhourri (July) Pobéguin 375! Kindia (July) Jac.-Fél. 1! **S. L.:** N. of Mongo, Musaia (Aug.) Haswell 65! **Ghana:** Vane (July) Harris! **N. Nig.:** Jos Plateau (Aug.) Lely P615! Also in **E. Cameroun, Congo, Sudan, Ethiopia, Uganda, Tanzania, Malawi, Zambia**, and **Madagascar**.

44. **Habenaria laurentii** De Wild. Not. Pl. Util. Congo 2: 325 (1904). *APD acc*

A leafy erect herb 1-3 ft. high, with a loose raceme of large pale green and white flowers.

Mali: Kita Massif (July) Jaeger! **Guin.:** Kinsam Plateau, Kindia (July) Jac.-Fél. 1801! **S. L.:** Bintumane Peak, Loma Mts. (July) Bakshi 232! **N. Nig.:** Naraguta (June) Lely 319! Jos Plateau (July) Lely 397! Kontagora (June) Dalz. 565! Ancho (Aug.) Hepburn 145! Mando, Zaria (July) Keay FHI 25980! Abinsi & Katsina Ala (Sept.) Dalz. 840! **S. Nig.:** Ago-Are F.R., Oyo Dist. (Aug.) Onochie FHI 40879!

Also in **E. Cameroun, C. African Rep., Congo, Kenya** and **Rhodesia**.

45. **Habenaria cornuta** Lindl. in Hook., Comp. Bot. Mag. 2: 208 (1837). *APD acc*

Habenaria ceratopetala, A. Rich. (1840)-F.T.A. 7: 231.

Habenaria ruwenzoriensis Rendle (1895)-F.T.A. 7: 233; F.W.T.A., ed. 1, 2: 412.

An erect herb up to 2 1/2 ft. high; flowers green in a rather dense raceme; in damp grasslands and marshes.

N. Nig.: Zungeru (Sept.) Dalz. 228! Naraguta, Jos Plateau (June) King 176!

Eastwards to **Ethiopia** and **Kenya**, southwards in E. Africa to the eastern Cape Province and Natal.

[*H. ruwenzoriensis* Rendle consists entirely of plants with abnormal flowers in which the anterior petal-lobe is very much reduced.]

46. *Habenaria walleri* *Rchb. f.* Otia Bot. Hamburg. 98 (1881); F.T.A. 7: 247. *APD acc*

A slender **terrestrial** herb 1-4 ft. high; flowers large, white, up to 12, in narrow racemes.

Guin.: Yaoulalay, Pita (July) Adames 300! **N. Nig.:** Minna (June) Dudgeon! Jos (June) Lely 315! Naraguta F.R. Kennedy FHI 8062! Shitikan, Kwaya (Aug.) Daggash FHI 24864! Mando, Zaria (July) Keay FHI 25979! Kilba country, Yola (Aug.) Dalz. 220!

Eastwards to **Kenya**, southwards in E. Africa to Malawi.

47. *Habenaria occidentalis* (*Lindl.*) *Summerh.* in Kew Bull. 1933: 246. *APD acc*

Amphorchis occidentalis *Lindl.* (1862)-F.T.A. 7: 262,

A. atacorensis *A. Chev.*, Bot. 621, name only.

A **ground orchid** 6-12 in. high; leaf with white markings; flowers orange or yellow.

iv. C.: Bauna Reserve (Apr.) Aké Assi 8651! **Dah.:** Atacora Mts. (June) Chev. 24194! **N. Nig.:** Jebba Barter 148! Anara F.R., Zaria (May) Keay FHI 22906! Mando F.R., Zaria (June) Keay FHI 25834! Bonu, Niger Prov. (June) E. W. Jones 224!

Also in **C. African Republic**.

48. *Habenaria lelyi* *Summerh.* in Kew Bull. 1932: 188. *APD acc*

An erect herb 1-2 ft. high with single basal leaf; raceme 7-13-flowered; flowers white.

Guin.: Gali to Hinde, Fouta Djallon (July) Adames 318! **N. Nig.:** Ropp, 4,600 ft. (July) Lely 457! Anara F.R., Zaria (July) Keay FHI 25967! Kujuru, Zaria (July) G. V. Summerhayes 131! Kagarko, Zaria (July) G. V. Summerhayes 121! Heipan, Plateau Prov., 4,000 ft. (July) G. V. Summerhayes 149!

[In many plants the flowers are abnormal, the spur being more or less completely suppressed and/or the lateral lobes of the lip are very short and sometimes tooth-like.]

49. *Habenaria lecardii* *Kraenzl.* in Engl., Bot. Jahrb. 16: 150 (1892); F.T.A. 7: 228. *APD acc*

Slender herb up to 15 in. high with single basal leaf; flowers white, hairy, in short lax racemes.

Sen.: Mahina Lécard 190! **U. Volta:** Firon to Konkobiri, Gourma (July) Chev. 24350! **N. Nig.:** Tegna, Zungeru (June) Dalz. 566!

50. *Habenaria keayi* *Summerh.* in Bot. mus. Leaflet. Harv. Univ. 14: 217 (1951). *APD acc*

A **terrestrial** herb 3-18 in. high with a basal heart-shaped leaf (young plants with 2 leaves); flowers hairy, green, in a rather long loose raceme.

N. Nig.: Kaduna (July) Cole! Dogon Kurmi, Jemaa (Sept.) King 30a! Naraguta F.R., Plateau Prov. (July) King 30! Sara Mts., Bauchi Prov. (July) King 30b! **I S. Nig.:** Ibadan (Sept.) Keay FHI 25395!

51. *Habenaria macrura* *Kraenzl.* in Engl., Bot. Jahrb. 16: 152 (1892); F.T.A. 7: 229. *APD acc*

A slender **terrestrial** herb 1-2 1/2 ft. high with 2 basal leaves; flowers greenish white in few-flowered racemes.

N. Nig.: Vom, Jos Plateau, 3,000-4,500 ft. Dent Young!

Eastwards to **Ethiopia** and **Kenya** and south to **Angola** and Rhodesia.

52. *Habenaria armatissima* *Rchb. f.* Otia Bot. Hamburg. 98 (1881); F.T.A. 7: 227. *APD acc*

Habenaria eburnea *Ridl.* in J. Bot. 34: 293 (1886).

Habenaria yatengensis *A. Chev.*, Bot. 621, name only.

A slender **terrestrial** herb about 1 ft. high, with 2 large round basal leaves; flowers white in few-flowered racemes.

Mali: Yatenga (Aug.) Chev. 24809! **N. Nig.:** Mandara E. Vogel!

East to **Ethiopia** and **Kenya**, south to SW. Africa and Mozambique.

6. PLATYCORYNE

Rchb. f. in Bonplandia 3: 212 (1855); F.T.A. 7: 255.

- 1 Lip quite entire; leaves evenly scattered along the stem, up to 5 cm. long and 1 cm. broad:2
 Lip with a short tooth-like lobe on each side near the base; leaves mostly in a bunch at base of the stem, but a few scattered all along, up to 2.5 cm. long and 4.5 mm. broad; inflorescence 2-6-flowered; dorsal sepal 6.5-7.5 mm. long; petals entire; lip 5-7 mm. long, lateral lobes 0.3-0.5 mm. long, middle lobe 4-5 mm. long, much broader, spur much thickened, in the lower part, 9-11.5 mm. long; anther shortly apiculate, canals 1.5-3 mm. long; rostellum middle lobe narrowly lanceolate, acute, shorter than the anther, side lobes rather stout; stigmas club-shaped, 1.5-2 mm. long [3a. crocea subsp. elegantula](#)
- 2 Inflorescence usually 1-3-, rarely 4-5-flowered; middle lobe of rostellum narrowly lanceolate, either short and tooth-like or up to nearly as long as the anther and closely appressed to it, side lobes slender, not much wider than the anther-canals, the latter 2.8-4 mm. long; dorsal sepal 6.5-9.5 mm. long; petals entire; lip usually 5-7 (sometimes to 9) mm. long, spur 8-11.5 mm. long, sometimes shorter by partial abortion; stigmas club-shaped, 2-2.8 mm. long [1. paludosa](#)
- Inflorescence 3-9-flowered; middle lobe of rostellum lanceolate, much broadened at the base, overtopping the anther, and placed some distance in front of it, side lobes stout from a broad base, much wider than the anther-canals, the latter 2-2.5 mm. long; dorsal sepal 6-7 mm. long; petals entire; lip 6-7 mm. long, spur much thickened in lower part, 12-16 mm. long; stigmas with broad flattened ovate apex, 2-2.5 mm. long [2. megalorrhyncha](#)

1. *Platycoryne paludosa* (Lindl.) Rolfe in F.T.A. 7: 256 (1898); Chev.Bot. 622. *APD acc*

Platycoryne aurea (Kraenzl.) Rolfe in F.T.A. l.c. (1898).

Platycoryne wilfordii (Ridl.) Rolfe in F.T.A. l.c. (1898).

A slender **terrestrial** herb up to 18 in. high with a very short raceme of usually 1-3 deep yellow or orange flowers; **in marshes or damp grassy places.**

Sen.: Upper Senegal Lécard 204! Djebel, Ziguinchor (Sept.) Doumlia 752! Broadbent 102! Casamance (Aug.) Berhaut. 6347! **Mali:** Mt. Kita, 5,300 ft. (July) Jaeger! **Port. Also in **E. Cameroun.**

2. *Platycoryne megalorrhyncha* Summerh. in Kew Bull. 1933: 250. *APD acc*

A **terrestrial** somewhat leafy herb 6-12 in. high with yellow flowers; **in marshes, swamps or on wet rocks.**

N. Nig.: Likitaba to Gembu, Mambila Plateau (June) Chapman 11! **W. Cam.:** Wum (June) Daramola FHI 41084! Fougom, Bamenda, 3,500 ft. (Apr.) Maitland 1509! Bafut, Bamenda (June) Ujor FHI 30450!

3. *Platycoryne crocea* (Schweinf. ex Rchb. f.) Rolfe in F.T.A. 7: 257 (1898) *APD acc*

Widespread in tropical Africa.

3a. *Platycoryne crocea* subsp. *elegantula* (Kraenzl.) Summerh. in Kew Bull. 17: 532 (1964). *APD acc*

Platycoryne elegantula Kraenzl. in Engl., Bot. Jahrb. 51: 376 (1914).

A slender **terrestrial** herb 5-10 in. high with white or yellow flowers; **in grasslands or marshes.**

W. Cam.: Bum, Bamenda, 4,000 ft. (May, June) Maitland 1443! 1538!

Also in **E. Cameroun** and **Zambia.**

7. DISA

Berg., Pl. Cap. 348, t. 4, fig. 7 (1767); F.T.A. 7: 275.

- 1 Dorsal sepal with a long narrow claw, 2-2.5 cm. long, spur usually curved upwards, 5-6 mm. long; petals with an ear-shaped lower part and a narrow twisted upper portion, nearly as long as the dorsal sepal; lip simple, thread-like, 1.5 cm. long; anther erect [4. erubescens](#)
Dorsal sepal narrowed at the base but with no distinct claw, 5-10 mm. long: **2**
- 2 Spur upright or curved downwards in the upper part only; petals entire; anther horizontal: **3**
Spur pendulous from its base; petals bilobed, anterior lobe shorter, ovate or semi-orbicular, posterior lobe upright, narrow, acute or obtuse; anther erect: **5**
- 3 Dorsal sepal, including spur, upright, slightly swollen at apex, 6-13 mm. long; slender plant 20-70 cm. high; inflorescence rather lax: **4**
Spur curved downwards in the upper part, tapering from a broad base, 7-8 mm. long; rather stout plant, 35-80 cm. high; inflorescence dense, bracts large, 1-2 cm. long; leaves linear-lanceolate, 8-15 cm. long, 1.5-2 cm. broad [3. hircicornis](#)
- 4 Bracts narrowly lanceolate, scarcely encircling the pedicel and ovary, 4-10 mm. long; leaves on stem narrowly lanceolate, up to 8 mm. broad [2. nigerica](#)
Bracts oblong- or elliptical-lanceolate, more or less encircling the pedicel and ovary; leaves on stem lanceolate, up to 15 mm. broad [1. equestris](#)
- 5 Flower spike very dense, 13-30 cm. long, 1.5 cm. diam.; flowers yellow; sepals 5-8 mm. long, spur 7-8.5 mm. long; petala 4-6.5 mm. long, anterior lobe much shorter than posterior, more or less truncate, narrowed towards base [5. ochrostachya](#)
Flower spike rather dense, 10-18 cm. long, 2-3 cm. diam.; flowers pink or purple; sepals 6-12 mm. long, spur 5-8 mm. long; petals 6-8 mm. long, anterior lobe nearly as long as or equalling posterior, semi-orbicular, posterior oblong-lanceolate, acute or obtuse [6. welwitschii](#)

1. *Disa equestris* *Rchb. f.* in Flora 48: 181 (1865); F.T.A. 7: 284. *APD acc*

APD: *Synonym of Herschelianthe baurii (Bolos) Rauschert*

A slender **terrestrial** herb 1-2 ft. high with a rather lax inflorescence of small purple flowers.

N. Nig.: Jos (June) King 90! Daffo, 4,200 ft. (July) Horsman in Hb. King 90a! **W. Cam.:** Ndop Plain, 3,800 ft. (Mar.) Brunt 260a!

Also in E. Cameroun, C. African Rep., Congo, Tanzania, southwards to **Angola** and Mozambique.

2. *Disa nigerica* *Rolfe* in Kew Bull. 1914: 214. *APD acc*

A slender **terrestrial** herb 8-12 in. high with a rather lax inflorescence about 4 in. long of small purple flowers.

N. Nig.: Ropp, 4,600 ft. (July) Lely 446! Sara Mt., Bauchi Prov. (May) King 52! 52a! **W. Cam.:** Bafut-Ngemba F.R., Bamenda, 6,000 ft. (Mar.) Richards 5313!

3. *Disa hircicornis* *Rchb. f.* Otia Bot. Hamburg. 105 (1881); F.T.A. 7: 283. *APD acc*

A slender to rather stout **terrestrial** herb, 1-2 1/2 ft. high, with a dense cylindrical flower spike 2-7 in. long; flowers purple with darter markings; **in damp grassy places and marshes**

N. Nig.: Vom, Plateau Prov., 3,000-4,500 ft. (July) Dent Young! King 161! Kan lyaka, Mimbila Plateau, 5,500 ft. (July) Champman 23! **W. Cam.:** Lakom, Bamenda, 6,000 ft. (June) Maitland 1781!

East to **Kenya**, south to **Angola** and Rhodesia.

4. *Disa erubescens* *Rendle* in J. Bot. 33: 297 (1895); F.T.A. 7: 277. *APD acc*

A **terrestrial** herb 1-3 ft. high, with the lower sheaths spotted; leaves on separate barren shoots linear or narrowly lanceolate, 6-18 in. long; spike about 2-6 in. long, rather lax, 3-10-flowered; flowers orange, flame-coloured or deep red, spotted in parts; **in grassy places and marshes.**

N. Nig.: Lekitaba to Gembu, Mambila Plateau, 5,500 ft. (June) Chapman 12! **W. Cam.:** Bafut-Ngemba F.R., 6,200 ft. (July) Brunt 838! Basenako, Bamenda, 6,000 ft (June) Maitland 1503! Manenguba Mts., 6,000 ft. (June) Gregory 301!

Also eastern Congo, E. Africa, from **Sudan** southwards to **Angola** and Zambia.

5. **Disa ochrostachya** *Rchb. f.* in Flora 48: 181 (1865); F.T.A. 7: 279. *APD acc*

An erect **terrestrial** herb, 1-3 ft. high, with sheathing lanceolate leaves on flowering stems; foliage leaves on separate shoot, narrow, up to 15 in. long; flower spike long and slender; flowers yellow with orange markings; **in grassland**.

W. Cam.: Nchan, Bamenda, 5,000 ft. (Apr.) Maitland 1779!

Also in eastern Congo, E. Africa from **Uganda** and **Kenya** south to **Angola** and Rhodesia.

6. **Disa welwitschii** *Rchb f.* in Flora 48: 181 (1865); F.T.A. 7: 280.

Disa subaequalis *Summerh.* in Kew Bull. 1936: 221; F.W.T.A., ed. 1. 2: 414.

Disa scutellifera of F.W.T.A., ed. 1, 2: 414, not of A. Rich.

An erect **terrestrial** herb, 1-3 ft. high, with linear leaves up to 18 in. long on sterile shoots and sheaths on the scape; flowers pink or purple; **in grasslands and swamps**.

Guin.: Nimba Mts., 5,300 ft. (June-Sept.) Schnell 1491! 1558! 1830! 3394! **S. L.:** summit Bintumane Peak, Loma Mts. (Aug.) Jaeger 1042! **Iv. C.:** Nimba Mts., 2,500-5,000 ft. (Aug.) Boughey GC 18047! **N. Nig.:** Vom, 3,000-4,500 ft. Dent Young! Heipan, Plateau Prov., 4,000 ft. (July) G. V. Summerhayes 152! King 18! Kan lyaka, Mambila Plateau, 5,500 ft. (July) Chapman 17! **W. Cam.:** Basenako, Bamenda, 6,000-6,000 ft. (June) Maitland 1545! Basenako-Lakom, 5,000-6,000 ft. (June) Maitland 1616b! Bum to Nchan, Bamenda, 4,000-5,000 ft. (May) Maitland 1788! Bali-Ngemba F.R., Bamenda (May) Ujor FHI 30324!

Widespread in tropical Africa.

8. BROWNLEEAE

Harv. ex Lindl. in Hook., Lond. J. Bot. 1: 16 (1842); F.T.A. 7: 287.

- 1 Slender terrestrial herb 20-60 cm. high; leaves 2-3, erect, the lower one 7-22 cm. long, narrowly lanceolate, acute, the upper much smaller but otherwise similar; spike dense, 3-7 cm. long, 1-1.5 cm. diam.; flowers small, purple; dorsal sepal 3 mm. long, hooded, with a short curved spur; petals united to dorsal sepal, obliquely elliptical; lip very small, entire; anther horizontal; rostellum erect, notched or cleft at apex [parviflora](#)

Brownleea parviflora *Harv. ex Lindl.* l.c. (1842). *B. alpina* (Hook. f.) N. E. Br. in F.T.A. 7: 287 (1898); F.W.T.A., ed. 1, 2: 417. *APD acc*

W. Cam.: Cam. Mt., 6,000-8,000 ft. (Sept.-Nov.) Mann 2120! Johnston 86! Preuss 973!

Also In E. Africa from **Kenya** southwards to eastern Cape Province.

9. SATYRIUM

Sw. in Vet.-akad. Handl. Stockholm, ser. 2, 21: 214 (1800); F.T.A. 7: 262. Nom. cons.

- 1 Leaves 2, radical, broadly orbicular, more or less adpressed to the ground, up to 6 cm. long and 9.5 cm. broad; inflorescence short, up to 18-flowered; sepals and petals a little longer than the lip; lip 1-1.7 cm. long, spurs rapidly tapering from a swollen base, shorter than or equalling the lip; column bow-shaped; stigma oblong; rostellum middle lobe shovel-shaped, side lobes rounded [l. carsonii](#)
- Leaves cauline, or if radical, not orbicular nor adpressed to the ground: 2
- 2 Spurs slender, only slightly tapering from the base, much longer than the lip; bracts sharply reflexed at time of flowering: 3
- Spurs rather stout, tapering towards the apex, shorter than or at most equalling the lip, 4-6 mm. long; inflorescence dense, up to 17 cm. long, with large often spreading bracts; lip 6-8 mm. long with a rather broad opening; sepals and petals about as long as the lip; rostellum with 3 almost equally long lobes, the middle one refuse or more or less bifid [5. atherstonei](#)

- 3 Lip rather fleshy with narrow opening; leaves on flowering-stem sheath-like, true foliage leaves on a separate short stem:4
- Lip rather membranous with a broad opening; leaves on flowering stem narrowly or oblong-lanceolate, acute, up to 30 cm. long and 5 cm. broad; inflorescence rather dense, many-flowered, up to 40 cm. long; flowers white, rose-pink or purplish; lip about 5 mm. long, lateral sepals and petals about the same length; spurs 8-12 mm. long; rostellum middle lobe ovate or orbicular with a narrow claw4. *crassicaule*
- 4 Flowers white or purple; inflorescence rather dense, up to 15 cm. long, lip more or less globose, 5 mm. long, spurs 9-13 mm. long; lateral sepals slightly longer than the lip; dorsal sepal and petals glabrous; middle lobe of rostellum triangular, acute2. *coriophoroides*
- Flowers green or brownish-green; inflorescence rather lax, many-flowered, up to 40 cm. long; lip flattened, ellipsoid, 4-5-6 mm. long, spurs 1-2 cm. long; lateral sepals about as long as the lip; petals densely pubescent; middle lobe of rostellum broadly triangular-oblong with a narrow claw3. *volkensii*

1. *Satyrium carsonii* Rolfe in F.T.A. 7: 265 (1898). *APD acc*

Satyrium leucanthum Schltr. in Engl., Bot. Jahrb. 53: 525 (1915); F.W.T.A., ed. 1, 2: 417, fig. 327.

Satyrium nigericum Hutch. in Kew Bull. 1921: 402.

A **terrestrial** herb up to 2 ft. high with white or pink-tinged rather waxy flowers; **in grasslands**.

N. Nig.: Jemaa (June) G. V. Summerhayes 109! Zonkwa to Kaciya, Zaria (July) G. V. Summerhayes 126! Vom, 3,000-4,500 ft. (July, Aug.) Dent Young 237! Lely P398! Bukuru to Hephram, 4,300 ft. (July) Lely 344!

Also in **B. Cameroun, Congo, Kenya, Tanzania, Malawi** and **Zambia**.

2. *Satyrium coriophoroides* A. Rich. in Ann. Sci. Nat. sér. 2, 14: 274, t. 18, fig. 11, 1-5 (1840); F.T.A. 7: 269. *APD acc*

A **terrestrial** herb up to 3 ft. high; **in grasslands**.

W. Cam.: Bubaaki, Bamenda, 4,500 ft. (Apr.) Maitland 1786! Bansa, 5,000 ft. (June) Gregory 140!

Also in **E. Cameroun, Kenya** and **Ethiopia**.

3. *Satyrium volkensii* Schltr. in Engl., Bot. Jahrb. 24: 425 (1897). *APD acc*

Satyrium dizygoceras Summerh. in Kew Bull. 1932: 508; F.W.T.A., ed. 1, 2: 417.

A slender **terrestrial** herb up to 3 ft. high; **in grasslands**.

N. Nig.: Jos Plateau (May) Lely P318! Naraguta, 4,000 ft. (May) Lely 243! Kassa, Plateau Prov., 4,200 ft. King! **W. Cam.:** Lakom, Bamenda, 6,000 ft. (May) Maitland 1366! Bali-Ngamba F.R. (May) Ujor FHI 30324b! Babungo, Ndop Plain, 3,800 ft. (May) Brunt 451!

Also in **Kenya, Congo, Tanzania, Malawi** and **Rhodesia**.

4. *Satyrium crassicaule* Rendle in J. Bot. 33: 295 (1895); F.T.A. 7: 271. *APD acc*

A **terrestrial** moderately stout to stout herb up to 3 1/2 ft. high; **in wet grassy places, marshes or even in water**.

N. Nig.: Nguroje, Mambila Plateau, 5,500 ft. (July) Chapman 20! **W. Cam.:** Nchan, Bamenda, 5,000 ft. (June) Maitland 1385!

Also in **E. Cameroun, northern Congo, Ethiopia, Kenya** and **Tanzania**.

5. *Satyrium atherstonei* Rchb. f. in Flora 64: 328 (1881).

APD: *Synonym of Satyrium trinerve* Lindl.

Satyrium occultum Rolfe in F.T.A. 7: 273 (1898); F.W.T.A., ed. 1, 2: 417.

Satyrium djalonis A. Chev., Bot. 621.

A **terrestrial** herb up to 3 1/2 ft. high with 2-3 lanceolate, acute or subacute leaves on the stem and white flowers; bracts often whitish; **in marshes and grasslands**.

Guin.: Dalaba-Diaguissa Plateau, 3,000-4,000 ft. (Oct.) Chev. 18814! Dalaba (Aug.) Jac.-Fél. 7059! Boula, Baizia (Apr.) Adam 12067! Fon Massif, Simandou, 5,300 ft. (July, Aug.) Schnell 3090! 3322! **S. L.:** Bintumane Peak, Loma Mts. (May,

July, Aug.) Jaeger 1049! Bakshi 233! Deighton 5092! **N. Nig.:** Maisamari, Mambila Plateau, 5,500 ft. (June) Chapman 9! **S. Nig.:** Obudu Plateau, Ogoja Dist., 5,300 ft. (June) Howard in Hb. King 157! **W. Cam.:** Bum, Bamenda, 4,000 ft. (June) Maitland 1575!

Generally in tropical Africa; southwards to Transvaal, Natal and eastern Cape Province.

10. DISPERIS

Sw. in Vet.-akad. Handl. Stockholm, ser. 2, 21: 218 (1800); F.T.A. 7: 288.

- 1 Leaves 1-3, alternate, sessile:2
 Leaves 2, opposite, broadly ovate, acute, cordate at base; hood formed by dorsal sepal and petals cylindrical or helmet-shaped; petals variously lobed:4
- 2 Hood formed by the dorsal sepal and petals helmet-shaped, narrow, 4-6 mm. long; appendage of lip entire, linear, slightly broadened at the apex, placed vertically within the hood; lamina of lip sharply reflexed, narrowly oblong, about 0.5 mm. long; arms of rostellum short, apices sharply incurved; leaves ovate, up to 7 mm. long and 4 mm. wide [1. parvifolia](#)
 Hood formed by dorsal sepal and petals broad and shallow, not helmet-shaped; appendage of lip bifid with apparently two divergent lobes; lamina of lip much broadened at apex, longer than the appendages:3
- 3 Petals cordate at the base; hood 6-8 mm. long, bent forward, narrowed towards the apex; lateral sepals 8-10 mm. long, united in lower half or below, obliquely ovate, apices turned outwards, sub-acute; lip 5-6 mm. long, claw narrow, lamina transversely elliptical with tall narrow keel in lower centre, appendages elliptical-oblong; leaves ovate or lanceolate, cordate at base, up to 3 cm. long and 2 cm. broad [2. togoensis](#)
 Petals narrowed at the base, not cordate; hood 8-10 mm. long, much bent forward, more or less rounded at apex; lateral sepals 8-10 mm. long, united in lower third, semi-elliptical, apices rather obtuse; lip about 6 mm. long, claw narrow, lamina ovate with high keel in centre of lower part, appendages linear-oblong; leaves orbicular-ovate, elliptical-ovate or lanceolate, cordate at base, up to 2.5 cm. long and 1.5 cm. broad; bracts much smaller, lanceolate or ovate [3. johnstonii](#)
- 4 Hood of flowers rather short and rounded, 4.5-5.5 mm. long; appendages of lip 2, parallel, cuneate, bilobed in upper part, 2.3-3.7 mm. long:5
 Hood of flowers narrow, cylindrical, over 6.5 mm. long:6
- 5 Spurs on lateral sepals much projecting, 1.7-3 mm. long; lateral sepals 5-6 mm. long; basal lobe of petals usually short and narrow; free part of claw of lip much longer than appendages, the latter 2.7-4 mm. long; rostellum arms 1.5-2 mm. long [4. thomensis](#)
 Spurs on lateral sepals scarcely projecting, 0.7-1 mm. long; lateral sepals about 9.5 mm. long; basal lobe of petals large and rounded; free part of claw of lip only equalling or slightly longer than the appendages, the latter about 2.5 mm. long; rostellum arms 0.5-0.7 mm. long [5. nitida](#)
- 6 Anterior or upper petal-lobes slender, acuminate, projecting from front of hood like two horns about 4 mm. long; claw of lip 12 mm. long, dilated in the middle to form two small rounded projections; appendix at apex pendulous, 2.8-3.5 mm. long, divided at apex only or almost to base, apex of claw reflexed beneath appendages, about 1 mm. long; hood 12-16 mm. long [6. mildbraedii](#)
 Anterior or upper petal-lobes triangular or semi-elliptical, acute or rounded, 2 mm. long; claw of lip not dilated in middle:7
- 7 Apex of lip widened to form a triangular lamina about 3 mm. long bearing at its base on the upper surface two hairy retrorse clavate outgrowths; upper petal-lobe triangular, acute; claw of lip 6.5-7 mm. long; hood 6.5-10 mm. long [7. kamerunensis](#)
 Apex of lip shortly bent over, oblong, entire, appendage also pendulous, a little longer than the apex itself, divided irregularly to form a sort of fringe about 1.5 mm. long; upper petal-lobe semi-elliptical, rounded; claw of lip 8-12 mm. long; hood 10-17 mm. long [8. anthoceros](#)

1. *Disperis parvifolia* Schltr. in Engl., Bot. Jahrb. 53: 547 (1915). *APD acc*

Flowers pink or yellowish.

W. Cam.: Basenako to Nchan, Bamenda, 5,000 ft. Maitland!

Also in **Tanzania**.

2. *Disperis togoensis* Schltr. in Engl., Bot. Jahrb. 38: 2 (1905). *APD acc*

Disperis cardiopetala Summerh. in Hook. Ic. Pl. 33: t. 3270 (1935); F.W.T.A., ed. 1, 2: 418.

Disperis atacorensis A. Chev., Bot. 622, name only.

A dwarf **terrestrial** herb 2-6 in. high; leaves green with whitish veins above, purplish beneath; flowers 2-10 in a short raceme, rose, pink or pale mauve; **among rocks or at edge of forests**.

Ghana: Akpafu, 2,000 ft. (Apr.) Scholes 20! **Togo Rep.:** Mt. Agome, near Ashanti-Kpoeta (Mar.) Schlechter 12990! **Dah.:** Forfa, Atacora Mts. (June) Chev. 24060! **W. Cam.:** Bum, Bamenda, 4,000 ft. (Apr.) Maitland 1519!

Also in **E. Cameroun**, **Uganda** and **Tanzania**.

3. **Disperis johnstonii** *Rchb. f. ex Rolfe* in F.T.A. 7: 291 (1898). *APD acc*

A slender **terrestrial** herb 2-8 in. high; leaves veined on upper surface, purple beneath; flowers 2-6 in a short raceme, mauve and white or pink; **among rocks**.

N. Nig.: Anara F.R., Zaria Prov. Cole! Naraguta (Aug.) Lely 485! Keay FHI 20169! Jos Batten-Poole 385! Daramola FHI 44137!

Also in **E. Cameroun** and **Tanzania**.

4. **Disperis thomensis** *Summerh.* in Kew Bull. 1937: 458. *APD acc*

A **terrestrial** or epiphytic herb 3-8 in. high; leaves green or bronzy above, purplish beneath; flowers 1-6, in a short raceme, white with faint purplish markings; **in forests**.

Guin.: Mamou, Mt. Bilima, 3,300 ft. (Sept.) Jac.-Fél. 1838! Dalaba, Fouta Djallon (Aug.) Adames 328! Nimba Mts., crests, 4,000 ft. (Sept.) Schnell 3534! **S. L.:** Sugar Loaf Mt., 2,000 ft. (fl. Po:** Moka, 4,600 ft. (Sept.) Melville 419!

Also in **S. Tomé** and **Angola**.

5. **Disperis nitida** *Summerh.* in Kew Bull. 10: 222 (1956). *APD acc*

An **epiphytic or terrestrial** herb 5-12 in. high; leaves dark green, satiny; flowers 1-4 in a short raceme, white; **in montane forest in deep shade**.

W. Cam.: L. Bambulue, Bamenda, 6,000-7,000 ft. (Sept.) Savory UCI 475! above L. Oku, Bamenda, 6,000-7,000 ft. (Sept.) Savory UCI 451!

6. **Disperis mildbraedii** *Schltr. ex Summerh.* in Kew Bull. 1933: 268; *Schltr.* in Wiss. Ergebn. 1910-11, 2: 180 (1922), name only. *APD acc*

A **terrestrial** herb 4-11 in. high; flowers 1-4, in short raceme, white; **in forests**.

W. Cam.: L. Bambulue, Bamenda (Aug.) Ujor FHI 29965! **F. Po:** S. Isabel Mt., above Basilé, 3,700-4,700 ft. (Aug.) Mildbr. 6312!

7. **Disperis kamerunensis** *Schltr.* in Engl., Bot. Jahrb. 24: 431 (1897); F.T.A. 7: 575. *APD acc*

Disperis preussii *Rolfe* l.c. 291.

A **terrestrial** herb 4-8 in. high; flowers 1-3, in a short raceme.

W. Cam.: Cam. Mt., above Buea, 3,600-3,900 ft. (Sept.) Preuss 609! Musake Camp, 6,000 ft. Maitland 106!

8. **Disperis anthoceros** *Rchb. f. Otia* Bot. Hamburg. 103 (1881); F.T.A. 7: 292. *APD acc*

A **terrestrial** herb 2-11 in. high; flowers 1-4, in a short raceme, white or pale pink with lilac or pale purple markings.

N. Nig.: R. Bauna F.R., Plateau Prov., 4,200 ft. (Aug.) King 187!

Eastern Congo and eastern Africa from **Ethiopia** southwards to Natal.

11. VANILLA

Mill., Gard. Dict. Abr. ed. 4 (1754); F.T.A. 7: 176.

- 1 Sepals and petals 2-3 cm. long; outgrowths on lip composed of several thin flat overlapping cuneate jagged scales:2
- Sepals and petals 3-5 cm. or more long; outgrowths on lip consisting of hair-like structures:4
- 2 Leaves oblong-lanceolate or oblong-elliptical, acuminate in the distal half, rounded at the base, up to 12 cm. long and 2-5 cm. broad; sepals and petals 2-2.5 cm. long; lip united to column for three-quarters of length of latter forming a wide tube; side lobes broadly rounded, projecting forward from the point of union with, and front margin approximately at right angles to, the column; total length of lip 2 cm., crest at base of middle lobe composed of 4-5 scales, below this a rough narrow keel to the base of the lip; column 1-6 cm. long, slightly incurved [1. africana](#)
- Leaves elliptical or oblong-elliptical, shortly acuminate or broadly apiculate in the distal third or quarter, rounded at the base, up to 20 cm. long and 8 cm. broad; sepals and petals 2-3 cm. long; lip united to column for two-thirds of length of latter, forming a wide tube; front margin of side lobes forming a backwardly directed acute angle with the column, edges somewhat reflexed, both side and front lobes somewhat crenulate; crest composed of 4-5 scales, 2-4 mm. long, a raised smooth keel running from this towards base of the lip:3
- 3 Inflorescences many-flowered, often branched at the base; bracts very small, triangular, never leaf-like; lip 1-4-1-6 cm. long, front lobe 6-7 mm. broad; column 1-3-1-8 cm. long [2. ramosa](#)
- Inflorescences many-flowered, always simple; upper bracts small, triangular, lower ones often leaf-like, orbicular or elliptical, apiculate or shortly acuminate, up to 6 cm. long and 4-5 cm. broad, or the inflorescence-branch bearing small leaves below the flowers; lip 1-5-2 cm. long, front lobe 7-11 mm. broad; column 1-8-2-3 cm. long [3. crenulata](#)
- 4 Bracts of inflorescence small, 4 mm. long; sepals and petals 3-5-4 cm. long, white; tube formed by lip and column broad; leaves narrowly oblong-lanceolate, bluntly acuminate, 15-25 cm. long, 3-5-4-5 cm. broad; inflorescence up to 6 cm. long, 4-5-flowered; lip united to column for 1-2 cm., 3 cm. long, margins crenulate, coarsely hairy near the mouth [4. nigerica](#)
- Bracts of inflorescence ovate, imbricating, 1-3 cm. long; sepals and petals 6-8 cm. long, yellow or cream; tube formed by lip and column narrow and cylindrical at base, much widened above, blotched with purple or rose; leaves elliptical or oblong-obovate, shortly but broadly apiculate, 12-25 cm. long, 5-12 cm. broad; inflorescence up to 15 cm. long, densely many-flowered; lip united to column nearly to anther, 5-6 cm. long, obscurely trilobed, side lobes broadly rounded enveloping the apex of the column, middle lobe acute, front margin of lip very crenulate and folded; callus in centre of lip consisting of a dense tuft of fine hairs, tube of flower hairy inside middle lobe of lip with thicker long papillae especially at extreme apex [5. imperialis](#)

Vanilla planifolia Andr.

Is cultivated in our area as it is throughout the tropics for the sake of the vanilla flavouring obtained from the capsules.

1. Vanilla africana Lind. in J. Linn. Soc. 6: 137 (1862); F.T.A. 7: 176. *APD acc*

A **high-climbing** herb with short racemes of fragrant white or yellow flowers with purplish markings on the lip; **in rain forest**.

Guin.: Nzérékoré (May) Schnell 2761! Peahtah (Oct.) Linder 1108! Sinoe Basin Whyte! Nimba (Dec.) Adam 20267! **Iv. C.:** Béréby (Nov.) Oldeman 575! Guessabo to Duékoué (Nov.) de Wilde 843! **Ghana:** Akropong Hills, 1,500 ft. (Oct.) Johnson 859! Aburi (Sept.) Johnson 798! **S. Nig.:** Brass R. Barter 47! Agoi-Ibami F.R., Abakaliki Prov. (Mar.) Sanford 531/66!

Also in **Rio Muni**.

2. Vanilla ramosa Rolfe in J. Linn. Soc. 32: 457 (1896); F.T.A. 7: 177. *APD acc*

Vanilla ovalifolia Rolfe (1896)-F.T.A. 7: 178.

A fleshy **climbing** herb; flowers white or creamy white, lip marked with purple or mauve; **in rain forest**.

Ghana: Fumisua, Ashanti (Apr.) Andoh FH 5257! Axim (Feb.) Irvine 2197! **S. Nig.:** Lagos Rowland! Sapoba Kennedy 220! 2081! Angiama Barter 20134! Calabar Thomson 132! Oban Talbot! **W. Cam.:** Mbalange F.R., Kumba (Mar.) Binuyo & Daramola FHI 35648!

Also in **E. Cameroun**, **Rio Muni**, **Gabon** and **the Congos**.

3. Vanilla crenulata Rolfe in J. Linn. Soc. 32: 477 (1896); F.T.A. 7: 178. *APD acc*

Vanilla crenata A. Chev., Bot. 624, name only.

A **climbing** herb with long hanging racemes of white or yellow flowers with purple markings on the lip; **in rain forest**.

Guin.: base of Nimba Mts. (Mar.) Schnell 799! 3086! **S. L.:** Bumbuna (Apr.) Thomas 3432! Robis to Koinadugu (Mar.) Deighton 2963! Bo, Kakua (Oct.) Deighton 6151! Bumban to Lokko (Apr.) Sc. Also in **Principe**.

4. **Vanilla nigerica** *Rendle* Cat. Talb. 108 (1913). *APD acc*

A fleshy **climbing** herb; flowers white with rosy markings on the lip.

S. Nig.: Oban Talbot 776!

Also in **E. Cameroun**.

5. **Vanilla imperialis** *Kraenzl.* in Notizbl. Bot. Gart. Berl. 1: 155, t. 1 (1896); F.T.A. 7: 178. *APD acc*

A fleshy **climbing** herb with thick stems and dense racemes of large cream or yellow flowers with purple or rosy markings on the lip.

Iv. C.: Bafing Forest (July) Aké Assi 9041! **Ghana:** Ashanti, Mfrim, 1,500 ft. (Aug.) Vigne FH 2412! R. Fia, Techiman to Nkoranza (May) Westwood 113!

Also in **E. Cameroun, Congo, Uganda** and **Tanzania**.

12. NERVILIA

Commerson ex Gaud. in Frey., Voyage, 421 (1829); F.T.A. 7: 186 (as *Pogonia* Juss.). Nom. cons.

- 1 Inflorescence 1-flowered, much elongating in fruit:.....2
 Inflorescence 2-12-flowered; lip trilobed in upper half, side lobes short, acutely obtuse, middle lobe larger, triangular, recurved, disk with 2 longitudinal keels extending to the base of the middle lobe and a thickened vein between:5
- 2 Lip more or less wedge-shaped, trilobed at or near the apex, side lobes small, rounded, middle lobe much broader, margins erose, fimbriate or broadly toothed and much undulate; sepals and petals 8-19 mm. long; column 6-8 mm. long:3
 Lip trilobed at or below the middle, side lobes enveloping the column and about the same length, middle lobe much larger and longer, margin entire, with fleshy median pubescent callus; sepals and petals 12-20 mm. long:4
- 3 Middle lobe of lip erose or fimbriate, not much longer than the side lobes, with long hair-like outgrowth often projecting beyond the margins; leaf purple beneath; lip 8-18 mm. long[1. petraea](#)
 Middle lobe of lip shortly toothed or crenate, much undulate, distinctly longer than the side lobes, with short outgrowths along the centre and fine hairs scattered all over lip; leaf green on both sides; lip 14-17 mm. long [2. reniformis](#)
- 4 Middle lobe of lip much longer than basal entire part, broadly elliptical, 4-6 mm. broad; side lobes distinct, triangular, subacute or obtuse, about 1 mm. long; lip 13-17 mm. long; leaves irregularly marked with paler and darker green on upper surface; column 5-6 mm. long[3. fuerstenbergiana](#)
 Middle lobe of lip about equalling or shorter than basal entire part, narrowly elliptical, 2-4 mm. broad; side lobes rounded, obscure; lip 9-17 mm. long; column 7-10.5 mm. long; leaves uniformly green[4. adolphii](#)
- 5 Inflorescence 10-30 cm. high, rather slender; tubers spherical, 1-2 cm. diam.; leaf broadly or reniform-ovate, apiculate, cordate at base, with short petioles, lamina 6-17 cm. long, 9-13 cm. broad, mature petiole 1-6 cm. long; sepals ligulate, acute, 11-19 mm. long; petals similar, but relatively broader, 9-17 mm. long; lip 10-19 mm. long, side lobes 1-2 mm. broad, middle lobe 4-6 mm. long[5. kotschy](#)
 Inflorescence 20-40 cm. high, rather stout; tubers 1.5-2.5 cm. diam.; leaf ovate-orbicular, long-apiculate, deeply cordate at base, with long petiole, lamina when full-grown 10-15 cm. long, 12-17 cm. broad, mature petiole 17-22 cm. long; sepals ligulate, obtuse, 2-3-4 cm. long; petals similar but a little shorter; lip 2.5-4 cm. long, side lobes 3-6 mm. broad, middle lobe 7.5-10 mm. long, 9-15 mm. broad[6. umbrosa](#)

1. **Nervilia petraea** (Afzel. ex Pers.) Summerh. in Bot. Mus. Leafl. Harv. Univ. 11: 249 (1945).

Arethusa petraea Afzel. ex Pers., Syn. Pl. 2: 512 (1807).

Nervilia afzelii Schltr. (1911)-F.W.T.A., ed. 1, 2: 420.

Pogonia thouarsii Rolfe in F.T.A. 7: 187 (1898), not of Bl.

P. fineti A. Chev., Bot. 620, name only.

A small **terrestrial** orchid about 2-5 in. high; flower with yellowish-green tepals and whitish lip; leaf small, reniform, purple underneath.

Guin.: Farana (May) Chev. 13406! **S. L.:** Afzelius! York (May) Deighton 5537! Kassewe to Moyamba (May) Jordan 879!

N. Nig.: Bukuru (May) Baldwin 12003! Kwoi, Zaria Prov. (May) King 81! Abinsi (June) Dalz. 844! **W. Cam.:** Bum, Bamenda, 4,000 ft. (May) Maitland 1528!

Also in **C. African Rep., Congo, Uganda** and **Tanzania**.

2. **Nervilia reniformis** Schltr. in Engl., Bot. Jahrb. 53: 551 (1915).

APD: Synonym of Nervilia simplex (Thouars) Schltr.

A small **terrestrial** orchid 2-10 in. high; tepals white to pale yellow, lip with reddish veins and centre yellow streak; leaves pale green, reniform.

N. Nig.: Sanga River F.R., Jemaa, Zaria Prov. (May) E. W. Jones! 69! King 111! Richa, Plateau Prov. (May) King 111a! 111b! **S. Nig.:** Olla Hills F.R., Ibadan (Apr.) Binuyo FHI 36921!

Also in **Tanzania**.

3. **Nervilia fuerstenbergiana** Schltr. in Fedde Rep. 9: 331 (1911). *APD acc*

APD: Synonym of Nervilia adolphii Schltr. var. adolphii

APD: Synonym of Nervilia gassneri Borge Pett.

APD: Synonym of Nervilia stolziana Schltr.

A small **terrestrial** orchid 2-5 in. high; tepals white or greenish, lip with reddish markings; leaf reniform, mottled above.

S. L.: S. Kambui Hills (Mar.) Dawe 451! **N. Nig.:** Nindam F.R., Zaria Prov. King 95!

Also in **Cameroun**.

4. **Nervilia adolphii** Schltr. in Engl., Bot. Jahrb. 53: 552 (1915), and in Fedde Sep., Beih. 68: t. 46, No. 182 (1932). *APD acc*

APD: Synonym of Nervilia adolphii var. seposita N. Hallé & Toill.-Gen.

APD: Synonym of Nervilia gassneri Borge Pett.

A small **terrestrial** orchid 2-8 in. high; flowers greenish-yellow or yellowish, tinged and marked mauve; leaves reniform, green above, tinged purple beneath.

N. Nig.: Dogon Kurmi, Jemaa, Zaria Prov. King. 112b! Monguna, Plateau Prov. (Apr.) King 112a!

Also in **Uganda, Tanzania** and **Zambia**.

5. **Nervilia kotschy** (Rechb. f.) Schltr. in Engl., Bot. Jahrb. 45: 404 (1911). *APD acc*

APD: Synonym of Nervilia ballii G. Will.

Pogonia kotschy Rechb. f. (1864)-F.T.A. 7: 187.

Nervilia purpurata (Rechb. f. & Sond.) Schltr. (1911)-F.W.T.A., ed. 1, 2: 420.

A slender **terrestrial** herb 4-12 in. high, with a short raceme of 2-5 pale olive-green flowers with purple veins on the lip; leaf broadly ovate, short-petioled, lamina 3-7 in. long.

Mali: Kita Massif Jaeger 2221! **N. Nig.:** Naraguta F.R., Plateau Prov. (Apr.) King 107! Zelau, 3,200 ft. (Apr.) Lely 117! Amban, Plateau Prov. (Apr.) King 107a! Anara F.R., Zaria (May) Keay FHI 22949! Kaciya to Zonkwa, Zaria Prov. (Mar.) G.V. Summerhayes 141! Lame Dist., Bauchi Prov. (May) G.V. Summerhayes 50!

Eastwards to **Sudan** and **Uganda**, south to **Angola**, Mozambique and Transvaal.

6. **Nervilia umbrosa** (*Rchb. f.*) *Schltr.* Westafr Kautsch.-Exped. 274 (1900).

APD: *Synonym of Nervilia shirensis (Rolfe) Schltr.*

APD: *Synonym of Nervilia renschiana (Rchb. f.) Schltr.*

APD: *Synonym of Nervilia bicarinata (Blume) Schltr.*

Pogonia umbrosa *Rchb. f.* (1867)-F.T.A. 7: 186.

Nervilia shirensis of F.W.T.A., ed. 1, 2: 420, not of (Rolfe) Schltr.

A **terrestrial** herb 8-16 in. high with 2-12 greenish or yellowish flowers with purplish-red or brown veins on the lip; leaf often purple beneath.

Sen.: Sedhiou, Casamance (July) Berhaut 6134! **Port. G.:** Bafata (June) Esp. Santo 2685! Bananto to Canjambarim (June) Esp. Santo 2398! **Guin.:** Dalaba, Fouta Djallon Caille in Hb. Chev. 18146! Diaguissa, 4,000 ft. (Apr.) Chev. 12651! **S. L.:** Falaba (Mar.) Sc. Elliot 5119! **Ghana:** cult. specimen. **Togo Rep.:** Kewe (Mar.) Schlechter 12947! **N. Nig.:** Nupe (leaves only) Barter 1540! Zelau, 3,200 ft. (Apr.) Lely 117a! Randa (Mar.) Hepburn 131! Naraguta F.R., Plateau Prov. (Apr.) King 38! Abinsi (leaves only, June) Dalz. 843! **S. Nig.:** between Igboho and Ogun F.R., Oyo (Feb.) Keay FHI 23430! Ibadan (Mar.) Keay FHI 37569!

Also in **C. African Rep.**, **Congo**, **Angola**, **Tanzania**, **Malawi** and **Zambia**.

13. EPIPOGIUM

R. Br., Prodr. Fl. Nov. Holl. 330, 331 (1810); F.T.A. 7: 188.

- 1 Saprophytic leafless terrestrial herb up to 45 cm. high; tuber ovoid, up to 4 cm. long and 2.5 cm. diam.; scape erect, rather fleshy, with numerous blunt loosely sheathing scales on the lower part; raceme up to 25-flowered, 3-15 cm. long; flowers usually pendulous, whitish or cream with small purplish or pink spots; sepals and petals narrow, acute, nearly 1 cm. long; lip entire, narrowly ovate, with the cordate base enveloping the column, acute, about 1 cm. long, with 2 lines of short hairs running from base to apex, the latter somewhat thickened; spur up to 5 mm. long; column with swollen stigmatic lobes at the base, and much thickened at the apex [roseum](#)

Epipogium roseum (*Don*) *Lindl.* in J. Linn. Soc. 1: 177 (1857). *APD acc*

Limodorum roseum *Don* (1825).

Epipogium nutans (*Bl.*) *Rchb. f.* (1857)-F.T.A. 7: 188.

Epipogium africanum *Schltr.* in Engl., Bot. Jahrb. 45: 399 (1911).

Ghana: Puso Puso, Asiakwa (Feb.) Morton A3866! **W. Cam.:** Ambas Bay (Feb.) Mann 784! Moliwe, Buea (Feb.) Dalz. 8205! Mimbria, 4,000 ft., Cam. Mt. Richards 9346! Ebite to Boviongo, Kumba (Jan.) Keay FHI 37388! **F. Po:** 4,000-5,000 ft. (Jan.) Exell 795!

Also in **Annobon**, **Congo**, **Angola**, **Uganda**, **Indo-Malaysia**, **Australia** and **New Hebrides**.

14. AUXOPUS

Schltr., Westafr. Kautsch. Exped. 275 (1901), and in Engl., Bot. Jahrb. 38: 3 (1905). *APD acc*

- 1 Perianth segments less than 4 mm. long; labellum cuneate, emarginate at apex; tuber globose or cylindrical, up to 5.5 cm. long and 6-7 mm. diam.; stems slender, rather weak and flexuous, up to 27 cm. high, with a few very small sheathing scales; capsules 1-1.5 cm. long [1. kamerunensis](#)
- Perianth segments 5.5-7 mm. long; labellum oblanceolate, obtuse at apex; tubers narrowly cylindrical, up to 5 cm. long and 4-8 mm. diam.; stems slender, flexuous at the base only, 15-30 cm. high, with a few sheathing scales; capsules about 1.5 cm. long [2. macranthus](#)

1. *Auxopus kamerunensis* Schltr. in Engl., Bot. Jahrb. 38: 4, fig. 2 (1905); Cat. Talb. 147. *APD acc*

Whole plant pale brown or yellowish; in deep shade in forest.

Lib.: Kle, Boporo (Dec.) Baldwin 10629! **Iv. C.:** Adzopé to Boudepé (Dec.) Chev. 22681! **Ghana:** Tano Anwia F.R. (Dec.) Adams 2259! **N. Nig.:** Nupe Barter! **S. Nig.:** Sapele to Benin (Dec.) Also in **S. Tomé**, **Annobon**, **Principe**, **Congo**, **C. African Rep.**, **Sudan**, **Angola**, **Zambia**, **Mozambique** and **Natal**.

17. CHEIROSTYLIS

Blume, Bijdr. 413, t. 16 (1825); F.T.A. 7: 182.

- 1 Leaves ovate, shortly acuminate, rounded or slightly cordate at base, 1-4 cm. long, 0.8-2.5 cm. broad, petiole shorter than lamina; labellum equalling the perianth or slightly longer, 3.5-5.5 mm. long; herb 10-30 cm. high, stem creeping at base; raceme dense, short, up to 20-flowered; perianth 3.5-4.8 mm. long; labellum lobes broad, divergent, entire or obscurely toothed [1. *lepida*](#)
- Leaves broadly ovate or orbicular-ovate, very shortly acuminate, distinctly cordate at base, 7-18 mm. long, 6-16 mm. broad, petiole about equalling lamina; labellum distinctly longer than the perianth, 4.8-5.8 mm. long; herb 7-16 cm. high, creeping at base; raceme short, 3-10-flowered; perianth 3.5-4.2 mm. long; labellum lobes broad, divergent, distinctly toothed [2. *divina*](#)

1. **Cheirostylis lepida** (*Rchb. f.*) *Rolfe* in F.T.A. 7: 182(1897); F.W.T.A., ed. 1, 2: 421 (excl. S.L. specimen); Cat. Talb. 147. *APD acc*

Monochilus lepidus *Rchb. f.* (1881).

A small creeping plant rooting in lower part with a short raceme of white flowers; **in shade in forest.**

S. Nig.: Ikwette Plateau, Sonkwala, 5,300 ft. (Dec.) Savory & Keay FHI 25168! Oban Talbot 870! **W. Cam.:** Cam. Mt., 3,000-6,000 ft. (Nov.-Jan.) Dunlap 95! Mann 2130! Maitland 899! Schlechler 12845! **F. Po:** Ruiché to Caldera San Carlos 4,000 ft. (Jan.) Sanford 4324!

Also in **S. Tomé**, **Congo**, **Uganda** and **Tanzania**.

2. **Cheirostylis divina** (*Guinea*) *Summerh.* in Kew Bull. 7: 131 (1953). *APD acc*

Mariarisqueta divina *Guinea*, Ensayo Geobot. Guinea Contin. Espan. 268, fig. 46 (1946).

A small creeping plant, rooting in the lower part, with a short raceme of white flowers with buff spots in the throat; **on mossy or damp rocks.**

S. L.: Sugar Loaf Mt., 2,000-2,500 ft. (Nov., Dec.) Sc. Elliot 4027! T. S. Jones 281! Picket Hill, 2,000-2,800 ft. (Nov.) T. S. Jones 186! 209! **Lib.:** Nimba, 1,500 ft. (Nov.) Adames 788! **Ghana:** Nyinahin Range, Chairaiso, 1,500 ft. (Nov.) Morton A2812!

Also in **Rio Muni**.

18. ZEUXINE

Lindl., Collect. Bot. App. (1825); F.T.A. 7: 180. Nom. cons.

- 1 Plant 15-45 cm. high; lower part of stem decumbent, rooting, upper part erect; leaves in a bunch at base of the erect part, shortly stalked from a sheathing base, lamina lanceolate-ovate or lanceolate, acute, rounded at base, up to 7 cm. long and 3 cm. broad, petiole and sheath 1-2.5 cm. long; raceme slender, rather laxly many-flowered, 4-13 cm. long; flowers small, green and white; sepals and petals 2-3 mm. long; lip the same length, with a concave claw below bearing 2 hooked calli at the base, and a transversely elliptical or semi-orbicular often more or less bilobed lamina at the apex [1. *elongata*](#)
- Plant 8-18 cm. high, very shortly decumbent at base, otherwise erect; leaves all up the stem, linear, acute, somewhat sheathing at base, 1-3.5 cm. long, 2-4 mm. broad; spike short, 1-2.5 cm. long, densely up to 20-flowered; sepals and petals about 2.5 mm. long; lip the same length, more or less oblong, somewhat cordate at base, narrowed towards apex, obtuse, the margins incurved and more or less erose, the whole surface strongly papulose [2. *africana*](#)

1. **Zeuxine elongata** *Rolfe* in Bol. Soc. Brot. 9: 142 (1892); F.T.A. 7: 181; Cat. Talb. 147. *APD acc*

Flowers greenish-white, sometimes tinged pink. Up with orange or reddish claw; **in plantations or forest.**

S. L.: Lomaburu, Talla (Feb.) Sc. Elliot 5020! Taiama (Jan.) Deighton 5738! Kangahun, Gardima (Feb.) Deighton 6039! **Iv. C.:** Tos Forest, Bouaflé to Sinfra (Dec.) Aké Assi 7222! Yaokro (Jan.) Also in **S. Tomé**, **Principe**, **Annobon**, **E. Cameroun**, **Congo**, **C. African Rep.**, **Uganda** and **Tanzania**.

2. Zeuxine africana *Rchb. f.* in Flora 50: 103 (1867); F.T.A. 7: 181. *APD acc*

A short herb up to 6 in. high; in marshes.

N. Nig.: Sokoto (Jan.) Dalz. 447!

Also in **Angola** and **Natal**.

19. HETAERIA

Blume, *Bijdr.* 409 (1825), as *Etaeria*, corr. *Blume*, *Praef. Fl. Java vii* (1828); F.T.A. 7: 183.

- 1 Lip inferior; raceme 1-6 cm. long, rather densely 3-20-flowered; plant up to 20 cm. high; leaves aggregated in middle of stem; lamina lanceolate, acute, rounded or subcordate at base, 1.5-4.5 cm. long, 6-18 mm. broad; petiole and sheath 7-12 mm. long; dorsal sepal and petals 3-5 mm. long, lateral sepals a little shorter; lip 4-5 mm. long with a concave claw with 2 hooked calli at the base and 2 obovate divergent lobes at the apex [1. heterosepala](#)
Lip superior; raceme 3-20 cm. long, many-flowered: [2](#)
- 2 Lamina of lip entire, broadly deltoid or somewhat diamond-shaped with the long axis transverse, claw furnished just below lamina with a thickened incurved wing on each side and with a series of hooked calli on each side at the base; outgrowths on face of column united inwards so as to form a pouch below the rostellum; plant 15-35 cm. high, leaves 3-7 in the middle of the stem, lamina obliquely oblong-ovate, shortly acuminate, 3-8 cm. long, 1-3.5 cm. broad, petiole and sheath 1.5-2.5 cm. long; raceme 3-9 cm. long, dense; sepals and petals 3-4.5 mm. long; lip 2.5-4 mm. long [2. stammleri](#)
Lamina of lip divaricately bilobed, lobes narrowest at base, claw unthickened below lamina; outgrowths on face of column free from one another; leaves all along upper part of stem, lamina over 3 cm. long, petiole and sheath over 1.5 cm. long; raceme rather lax, 5-18 cm. long: [3](#)
- 3 Rostellum longer than the column, 2.5-3 mm. long; leaves obliquely elliptical-ovate or ovate, 3-10 cm. long, 1.5-4 cm. broad; inflorescence 5-15 cm. long; sepals 5-7.5 mm. long; lip 6.5 mm. long (to apex of middle lobe or central apiculus), lateral lobes 4-6 mm. long, 1-6-3 mm. broad [3. tetraptera](#)
Rostellum equalling or shorter than the column, 0.9-1.2 mm. long; lobes of lip 1.5-4 mm. long: [4](#)
- 4 Lobes of lip reflexed, oblong or narrowly oblanceolate but not much widened above, 1.5-2 mm. long; claw 3-4 mm. long, base forming two rounded sacs not projecting more than 0.5 mm. below the insertion of the lip; sepals 3-4.5 mm. long; arms of rostellum 0.9 mm. long; plant 30-45 cm. high; leaves obliquely lanceolate, lamina 9-14 cm. long, 2-5 cm. broad [4. mannii](#)
Lobes of lip spreading, broadly cuneate from a narrow base, rounded at apex, 2.5-4 mm. long, 2-3 mm. broad; claw 4-5.5 mm. long, base forming two distinct rounded spurs 1-2 mm. long; sepals 4-6.5 mm. long; arms of rostellum 0.9-1.2 mm. long; plant 30-60 cm. high; leaves obliquely lanceolate or elliptical-lanceolate, lamina 6-16 cm. long, 2-5 cm. broad [5. occidentalis](#)

1. Hetaeria heterosepala (*Rchb. f.*) *Summerh.* in *Kew Bull.* 1934: 207.

APD: *Synonym of Zeuxine heterosepala* (*Rchb. f.*) *Geerinck*

Cheirostylis heterosepala *Rchb. f.* (1881)-F.T.A. 7: 183.

Zeuxine commelinoides *A. Chev.*, *Bot.* 619, name only.

A herb with the lower part of the stems creeping and rooting, and small green and white flowers; in forests.

Lib.: Krah Bassa Forest (Jan.) van Harten 309! Nimba Adam 20803! **Iv. C.:** Cavally Basin, Grabo (July) Chev. 19814! **W. Cam.:** Cam. Mt., 3,000 ft. (Nov.) Mann 2130a!

Also in **S. Tomé**, **E. Cameroun**, **Congo** and **Tanzania**.

2. Hetaeria stammleri (*Schltr.*) *Summerh.* in *Kew Bull.* 1934: 208.

APD: *Synonym of Zeuxine stammleri* *Schltr.*

Zeuxine stammleri Schltr. in Engl., Bot. Jahrb. 38: 151 (1906); Cat. Talb. 147.

Stem creeping and rooted at the base, erect above; sepals pinkish brown or green, petals white; **in shade in forest.**

Iv. C.: Assikasso, Moyen Comoe (Dec.) Chev. 25601! Yapo Forest, N. of Abidjan (Dec., fr. Feb.) de Wilde 1017! Aké Assi 7348! **S. Nig.:** Shasha F.R., Ijebu (Feb.) Richards 3072! (June) Mann 430!

Generally distributed in tropical Africa, southwards to Natal and eastern Cape Province, Réunion and Madagascar.

21. MALAXIS

Soland. ex Sw., Prodr. Veg. Ind. Occ. 119 (1788);

Microstylis (*Nutt.*) *Eaton.*, F.T.A. 7: 17

- 1 Flowers close together at apex of inflorescence, forming a false umbel; petals almost as wide as sepals; margin of lip denticulate or fimbriate:2

Flowers in an elongated raceme or spike; petals much narrower than sepals; margin of lip entire:3

- 2 Lip bearing 2 parallel ridges at the base, often with a needle-like projecting point just in front on the median vein; sepals and petals 4-6 mm. long, the latter ciliolate; lip flabellate or transversely elliptical, emarginate at apex, 3.5-5.5 mm. broad; stems 3-6 cm. high, 3-4-leaved; leaves ovate or lanceolate-ovate, 4-7 cm. long, 2.5-5 cm. broad [1. maclaudii](#)

Lip bearing a single oblong entire callus at the base; sepals and petals 2.5-3 mm. long, all entire; lip quadrate-cuneate, emarginate at apex, basal margins much thickened, 2.5-3 mm. long, 2.5-3 mm. broad; stems 2.5-5 cm. high, 3-leaved; leaves narrowly ovate, 4-7 cm. long, 1.5-3 cm. broad [2. chevalieri](#)

- 3 Lip with a single central pubescent cushion at the base; sepals and petals 1.5-2.5 mm. long; column very short (0.3-0.7 mm. long), anther horizontal:4

Lip with 2 lateral pubescent cushions:5

- 4 Leaves at about the middle of the total height (10-16 cm.) of the plant, the vegetative stem more or less equalling the inflorescence; leaves 2-5, elliptical-lanceolate, 1-6 cm. long, 1-3 cm. broad; rhizome slender, creeping ..[3. prorepens](#)

Leaves near the base of the plant (total height 7-30 cm.), often almost on the soil, the vegetative stem (up to 4 cm. long) being much shorter than the inflorescence; leaves 2-3, elliptical to ovate, 2.5-8 cm. long, 1-6 cm. broad; no creeping rhizome, root a tuber 1-2 cm. diam [4. katangensis](#)

- 5 Lip oblong, longer than broad, with small rounded purple auricles, otherwise pale yellowish, 3-5 mm. long (auricles included); sepals and petals 3 mm. long; column 0.8 mm. long; stems 3-8 cm. high, 4-5-leaved; leaves lanceolate or broadly lanceolate, 2-5 cm. long, 1-2 cm. broad [5. melanotoessa](#)

Lip more or less quadrate or broadly orbicular, broader than long, narrowed at the front, auricles large, almost forming distinct side lobes, lip 2.5-3 mm. long (auricles included); sepals and petals 3-4 mm. long; column 1-6 mm. long; stems 3-12 cm. high, 3-leaved; leaves ovate, 3-5 cm. long, 1-3 cm. broad [6. weberbauerana](#)

1. **Malaxis maclaudii** (*Finet*) *Summerh.* in Kew Bull. 1934: 208.

APD: Synonym of Kornasia maclaudii (Finet) Szlach.

Microstylis maclaudii *Finet* (1907).

Flowers flesh to deep rose-coloured.

Guin.: Macenta, Mbalasso (June) Jac.-Fél. 891! Songoya Maclaud 81! foot of Nimba Mts. (June) Schnell 3093! **S. L.:** Loma Mts. (July) Jaeger 6840! **Lib.:** S. Nimba (June) Adam 21468! **Ghana:** R. Also in **C. African Republic**.

4. **Malaxis katangensis** *Summerh.* in Bot. Mus. Leafi. Harv. Univ. 14: 221 (1951). *APD acc*

Flowers pale green, turning brown or orange.

S. L.: Musaia (Aug.) Haswell 33! **N. Nig.:** Jemaa, Zaria Prov. (Aug.) King 98! Nimbia F.R., Zaria Prov. (July) King 98a!

Also in **Congo** and **Tanzania**.

5. **Malaxis melanotoessa** *Summerh.* in Kew Bull. 1934: 209. *APD acc*

Flowers pale greenish-yellow, lip dark purple at base.

Lib.: Gola Forest, S. of Ba (May) Bunting!

6. **Malaxis weberbaueriana** (*Kraenzl.*) *Summerh.* in Kew Bull. 1934: 208.

APD: Synonym of Malaxis welwitschii (Rchb. f.) ined.

Liparis weberbauerana *Kraenzl.* (1908).

Flowers brown or pink.

W. Cam.: Cam. Mt. Weberbauer 42! Bali-Ngemba, Bamenda (June) Ujor FHI 30424! Bafut-Ngemba F.R., Bamenda (May) Keay FHI 37935! Nkom Wum F.R. Wum (June) Daramola FHI 41083! **F. Po:** (cult. Ibadan, June) Sanford 4331!

22. LIPARIS

L. C. Rich. in Mém. Mus. Paris 4: 43, 52 (1818); F.T.A. 7: 19. Nom. cons.

- 1 Stems swollen at base to form an almost globose pseudobulb; stem 1·5-2 cm. long; leaves ovate, almost sessile, in a tuft at the base, 2-4 cm. long, 1-3 cm. broad; scape erect, 7-11 cm. long, flowering nearly to the base; fruit ellipsoid, 6-8 mm. long, about 4 mm. diam.; flowers unknown [1. kamerunensis](#)
- Characters not combined as above: **2**
- 2 Lip distinctly 3-lobed, about 4 mm. long, side lobes shortly triangular, middle lobe long and narrow, the margins inrolled so as to make it appear subulate, sharply inflexed at the middle, 2·5-3 mm. long, lip bearing a short bilobed callus at the base; leaves in a tuft at the base, narrowly oblong-ob lanceolate, acute, up to 7 cm, long and 1·8 cm. broad, margins sometimes very crinkled; inflorescence overtopping the leaves, many-flowered,

- bracts rather large, almost cordate at the base [2. tridens](#)
- Lip bilobed, or if trilobed the middle lobe reduced to an apiculus, the side lobes much larger and rounded: [3](#)
- 3** Stem long and slender, lower part creeping and rooting, upper part erect, leafy; leaves with short sheathing base and rather long petiole, lamina ovate or lanceolate-ovate, cordate or rounded at the base, 1-4 cm. long, 1-2 cm. broad; inflorescence about 4 cm. long, several-flowered; sepals and petals about 5 mm. long, the lateral sepals united shortly at the base; lip transversely oblong, about 4 mm. long and 7 mm. broad, side lobes almost orbicular, front lobe triangular, much smaller, lip with a large tooth at the base [3. goodyeroides](#)
- Primary stem short, consisting of a sympodial series of upright flowering shoots close together, the shoots sometimes thickened to form a pseudobulb: [4](#)
- 4** Petals almost twice as long as the dorsal sepal; leaves ovate or lanceolate, up to 6 cm. long, and 12 mm. broad; pseudobulbs 12-20 mm. long, 2-4-leaved; inflorescence flaccid, pendulous, up to 14-18 cm. long, many flowered, rhachis sharply 2-4 winged, 5 mm. broad; lower flowers aborted with up to 4 linear segments; fertile flowers, dorsal sepal 5-10 mm. long, petals narrowly linear, 8-15 mm. long; lip obovate or oblong from a cuneate base, 3-5-5 mm. long, bilobed, lobes rounded [4. caillei](#)
- Petals equal to or only slightly longer than the dorsal sepal; leaves lanceolate or lanceolate-ovate, mostly over 3 cm. long and usually at least 3 times as long as broad: [5](#)
- 5** Flowers large, lip over 1 cm. wide, transversely elliptical, with a broad retuse tooth-like callus in front of the column and a yellowish rounded swollen area on each side at the base; pseudobulbs ovoid, up to 2 cm. long and 2 cm. broad; leaves lanceolate to elliptical-lanceolate, up to 17 cm. long and 1-8 cm. broad; sepals 8-13 mm. long, the laterals united nearly to the apex; petals very narrow, 11-14 mm. long [5. platyglossa](#)
- Flowers rather small, lip under 7 mm. broad, suborbicular, elliptical, obcordate or obcordate-flabellate, with 2 small teeth or calli at the base; inflorescence usually much overtopping the leaves, many-flowered: [6](#)
- 6** Terrestrial plants, very rarely epiphytic; inflorescences 15-60 cm. high; lamina of leaves 5-25 cm. long, 0-9-8-5 cm. broad; lip obcordately bilobed, somewhat recurved, 2-5-4 mm. long, 2-5-4-5 mm. broad, lobes rounded; sepals 4-6 mm. long; petals narrower, 4-5-5-5 mm. long: [7](#)
- Epiphytic plants, rarely terrestrial on rocks; inflorescences 5-13 cm. high; lamina of leaves 2-10 cm. long, 0-4-1-8 cm. broad; lip suborbicular, elliptical, or obcordately flabellate: [8](#)
- 7** Leaves lanceolate, narrowly lanceolate or lanceolate-linear, with short petiole, 7-25 cm. long, 0-9-5 cm. broad, usually less than half the height of the inflorescence; lip rather fleshy; stem distinctly swollen at base forming a corm-like structure [6. rufina](#)
- Leaves elliptical or lanceolate-elliptical with a long petiole, 5-20 cm. long, 2-8-5 cm. broad, often more than half the height of the inflorescence; lip thin in texture; stem hardly swollen at the base [7. guineensis](#)
- 8** Leaves narrowly oblong or oblong-lanceolate, 4-12 mm. broad, tapering gradually to the petiole, obtuse or rounded and emarginate at apex, 2-11 cm. long; scape usually longer than the leaves; flowers green; dorsal sepal 5-6 mm. long; petals narrower, 5-6 mm. long; lip elliptical-obcordate, side lobes rounded, middle lobe reduced to an apiculus, lip 3-5-4-5 mm. long, 3-4 mm. broad, calli small, tooth-like [8. epiphytica](#)
- Leaves lanceolate or elliptical-lanceolate, usually over 15 mm. broad, acute, 3-10 cm. long: [9](#)
- 9** Lip flabellate, deeply emarginate, lobes rounded, whole lip 6 mm. long and broad; dorsal sepal 8-9 mm. long; petals very narrow, 9 mm. long; scape much exceeding the leaves [9. deistelii](#)
- Lip suborbicular, narrowed at the base, trilobed or truncate at the apex, side lobes large, rounded, middle lobe an apiculus, or scarcely visible, whole lip 4-5 mm. long, 4-5 mm. broad; dorsal sepal about 7 mm. long; petals narrower, equal in length; scape longer than the leaves [10. suborbicularis](#)

1. *Liparis kamerunensis* Schltr. in Engl., Bot. Jahrb. 53: 560 (1915). *APD acc*

Liparis capensis of F.T.A. 7: 22, not of Lindl.

W. Cam.: Cam. Mt., 6,000-7,000 ft. (Nov.) Mann 2129!

2. *Liparis tridens* Kraenzl. in Engl., Bot. Jahrb. 28: 162 (1900); Cat. Talb. 145. *APD acc*

A small epiphytic herb 2-5 in. high with small yellow or yellow-green flowers.

S. Nig.: Oban Talbot 872! 873! Sapoba Kennedy 2635! Akure F.R., Ondo Prov. (July) Onochie FHI 23417! Calabar Wright 102! **F. Po:** Moka, 4,200 ft. (fr. Sept.) Wrigley 652!

A fruiting specimen from Iv. C. (Tiapleu (fr. Oct.) Aké Assi 6027!) is probably referable to this species. Also in E. Cameroun and Uganda.

3. *Liparis goodyeroides* Schltr. in Engl., Bot. Jahrb. 38: 152 (1906). *APD acc*

APD: Synonym of *Liparis nervosa* (Thunb.) Lindl.

W. Cam.: Moliwe Stammler!

4. **Liparis caillei** *Finet* in Bull. Soc. Bot. Fr. 56: 97, t. I, fig. 1-13 (1909). *APD acc*

An epiphytic herb with a few small leaves and a long flattened rhachis with rather widely spread yellowish or brownish-maroon flowers.

Guin.: Caille Nzérékoré (fr. Sept.) Jac.-Fél. 1126! **S. L.:** Jama (fr. Sept.) Deighton 3062! Musaia (July) Deighton 4832!

Lib.: Du R. (July) Linder 78! St. John R., Gbanga (fr. Aug.) Baldwin 9138! Fo R., Kpalala (July) Harley 1507! **N. Nig.:** Jemaa, Zaria Prov. (June, July) King 86! **W. Cam.:** N'dlan (May) Wright 126!

Also in **Uganda**.

5. **Liparis platyglossa** *Schltr.* in Engl., Bot. Jahrb. 38: 152 (1906). *APD acc*

Liparis winkleri *Schltr.* l.c. 153 (1906).

Flowers reddish.

S. Nig.: cult. spec.! **W. Cam.:** Victoria (May) Stossel 5b! 21a! Victoria to Buea (July) Winkler 240! M'bonge Wright 60/58!

6. **Liparis rufina** (*Ridl.*) *Rchb. f. ex Rolfe* in F.T.A. 7: 19 (1897); Chev. Bot. 613.

APD: *Synonym of Liparis nervosa (Thunb.) Lindl.*

Liparis elata var. **rufina** *Ridl.* (1886).

Flowers green or yellow to reddish- or purplish-brown; **damp places in grassland or among rocks, sometimes in scrub.**

10. *Liparis suborbicularis* Summerh. in Kew Bull. 1934: 210. *APD acc*

Liparis epiphytica of Cat. Talb. 145, not of Schltr.

Flowers greenish yellow; in rock crevices.

S. Nig.: Oban Talbot 87! **W. Cam.:** Nkambe to Binka, 6,500 ft. (Sept.) Savory UCI 380!

Also in **E. Cameroun**.

23. ANSELLIA

Lindl., Bot. Reg. 1844, sub. t. 12 (1844); F.T.A. 7: 100. *APD acc*

- 1 Petals and sepals elliptical, petals often broader than sepals; lip broad, usually broader than long, front lobe more or less orbicular and somewhat retuse, keels 2, the central one either absent or very slightly developed; spots on flowers usually large and dark *1. africana*

Petals and sepals elliptical or more frequently narrowly elliptical, petals never broader than sepals; lip narrow, usually longer than broad, front lobe elliptical or almost oblong, obtuse, keels 3, the central one smaller but usually quite well developed; spots on flowers usually small and pale *2a. gigantea* var. *nilotica*

1. *Ansellia africana* Lindl. Bot. Reg. 1844, sub. t. 12; F.T.A. 7: 101. *APD acc*

Ansellia confusa N. E. Br. (1886)-F.T.A. 7: 102.

A robust epiphyte, up to 3-5 ft. high; flowers yellow with red or purple spots; in forest or bush.

Lib.: Lamco road, Nimba Mts. Harley 2248! **Iv. C.:** Kagbe (Nov.) Aké Assi 9332! **Ghana:** Abene, Kwahu (Jan.) Chipp 626! Adum Bansu, W. Prov. (Jan.) Fishlock 84! Abetifi, Kwahu, 2,000 ft. (Dec.) 24. POLYSTACHYA

Hook., Exot. Fl. 2: t. 103 (1824); F.T.A. 7: 103 Nom. cons.

- 1 Pseudobulbs or stems narrowly cylindrical or rarely swollen at apex, superposed, each one arising some distance above the base of the preceding one and continuing the growth in the same direction:2
 Pseudobulbs or stems tufted or closely placed, their bases forming a short creeping rhizome:9
 2 Flowers rather large, sepals over 6 mm. long:3

- Flowers small, sepals 5 mm. long or less:6
- 3 Flowers solitary, almost sessile; leaves knife-shaped, fleshy, often with many overlapping sheaths at base; stems widely creeping or hanging; sepals 8-9 mm. long, hairy; lip more or less oblong, side lobes small or very small, front lobe oblong, slightly reflexed at apex, 10-11 mm. long, 5-6 mm. broad:.....4
- Flowers in simple or branched inflorescences; leaves lanceolate-linear or lanceolate, gradually tapering towards the acute apex, up to 22 cm. long, 4-14 mm. broad; each pseudobulb arising some distance below apex of the preceding one, up to 30 cm. long, with 3 or more leaves; front lobe of lip triangular, acute:.....5
- 4 Leaves 8-15 cm. long, 6-8 mm. broad; each pseudobulb or stem arising from apex of preceding one; all stems 1-leaved; side lobes of lip distinct46. *crassifolia*
- Leaves 2-4.5 cm. long, 5-9 mm. broad; each pseudobulb or stem arising from upper part or apex of preceding one; some stems with numerous distichous leaves, others 1-leaved; side lobes of lip obscure 47. *mystacioides*
- 5 Dorsal sepal 10-16 mm. long, narrowly lanceolate, acuminate, sepals sparsely hairy; inflorescence simple, laxly 3-11-flowered; stems erect; lip in general shape lanceolate, side lobes shortly acutely triangular, front lobe long-triangular, sharply acute, lip 8-13 mm. long, 5-8 mm. broad; pseudobulbs arising from upper part of preceding one, 3-9-leaved, 5-20 cm. long43. *microbambusa*
- Dorsal sepal 6-9 mm. long, lanceolate to broadly lanceolate, sepals sparsely hairy; inflorescence branched with up to 4 branches, many-flowered, branches up to 2 cm. long; stems pendulous; lip when spread out more or less fan-shaped with a short claw, distinctly 3-lobed in the upper part, side lobes broad, rounded, middle lobe broadly triangular, acute, lip 6.5-8 mm. long and broad; each pseudobulb arising from lower part of preceding one, 3-7-leaved, 12-30 cm. long2b. *albescens* subsp. *angustifolia*
- 6 Raceme simple; pseudobulbs arising from one-third way up the preceding one, 3-7.5 cm. long, 2-4-leaved; leaves linear-ligulate, apex shortly bilobed, 3-12 cm. long, 3-8 mm. broad; raceme 3-13 cm. long, many-flowered; sepals 2.5-3.5 mm. long; lip 3-lobed, more or less hastate in outline, about 3-5 mm. long, side lobes acute, recurved, middle lobe lanceolate, acuminate23. *calluniflora*
- Inflorescence a panicle, often many-flowered; pseudobulbs arising from upper part of preceding one:7
- 7 Dorsal sepal 2-3 mm. long, obtuse; lip distinctly trilobed, hastate or cruciform; upper internode of stem not much swollen:8
- Dorsal sepal 4.5-5 mm. long, acuminate; lip obscurely trilobed, rhomboid-oblongate, 7 mm. long; upper internode of stem much swollen to form an ovoid or ellipsoid pseudobulb; stem with 4-5 leaves along its length and a single one at apex of the terminal pseudobulb; leaves 1.5-3.5 cm. long and 1-1.5 cm. broad; inflorescence very short, branched almost from the base42. *camaridioides*
- 8 Pseudobulbs 3.5-8 cm. long, 2-4-leaved; leaves linear-ligulate, 4-9 cm. long, 4-8 mm. broad; inflorescence 3-5 cm. long, branches simple; sepals 2-2.5 mm. long; lip 2 mm. long, broadly hastate, side lobes recurved, middle lobe broadly ovate, lip with small callus at base44. *superposita*
- Pseudobulbs up to 22 cm. long, 4-7-leaved; leaves oblong-lanceolate, unequally bilobed at apex, lamina 5-16 cm. long, 6-16 mm. broad; inflorescence 4-8 cm. long, branches compound; sepals 2-3 mm. long; lip 2-2.5 mm. long, cruciform, side lobes slightly incurved, middle lobe oblong-ovate, no callus at base of lip .45. *fusiformis*
- 9 Pseudobulbs much flattened, more or less prostrate on the substratum, 1 or more leaved at apex:10
- Pseudobulbs or stems vertically placed, usually much longer than broad, and never much flattened in the plane of the substratum:11
- 10 Inflorescence developing after the leaves at the apex of the mature pseudobulb; pseudobulbs orbicular or broadly elliptical, up to 5 cm. long and broad; stems erect, slender, 1-3-leaved, up to 12 cm. long; leaves oblanceolate, lamina 6-20 cm. by 2-5 cm., often purplish beneath; inflorescence with a few branches, usually longer than the leaves; bracts large, frequently longer than flowers, ovate-lanceolate, acuminate; flowers hairy; sepals 6-7.5 mm. long; lip obscurely 3-lobed, 5.5-8 mm. long, side lobes rounded, front lobe obtuse, lip with a pubescent keel in the lower part40. *affinis*
- Inflorescence developing with the leaves on the young pseudobulb; pseudobulbs elliptical, 2.5-5 cm. long, 1-2 cm. broad, with a single leaf at the apex and a leaf on each side at the base; leaves narrowly oblong, with a rounded slightly bilobed apex, 5-15 cm. long, 0.8-2.5 cm. broad; inflorescence branched, up to 17 cm. high; sepals 6.5-16 mm. long; lip 3-lobed, 7.5-11 mm. long, side lobes obtuse, middle lobe shortly acuminate, recurved, lip with short keel at base thickened into a callus in centre of middle lobe41. *obanensis*
- 11 Mature pseudobulbs or stems 1-leaved at apex, terete or almost so, sometimes gradually tapering upwards: ...12
- Pseudobulbs or stems 2 or more leaved, leaves sometimes fallen off at time of flowering:17
- 12 Lateral sepals each produced at the base into a hollow spur 2 mm. long; stems very slender, terete, 2-7 cm. long; leaf linear, tapering very gradually upwards, apex shortly bilobed, 4-16 cm. long, 2-4 mm. broad; inflorescence paniculate, 3-6.5 cm. long, peduncle and rhachis very slender, branches 1-4, very short, almost umbellate; dorsal sepal 3.5-4 mm. long; lip 3-lobed, about 6 mm. long, side lobes small, oblong, front lobe cuneate; lip with a small callus at base53. *bicalcarata*
- Lateral sepals not produced into spurs at base:.....13
- 13 Dorsal sepal 8-17 mm. long; laterals united with foot of column to form a mentum 13-22 mm. long; lip 3-lobed, 13-25 mm. long, side lobes small, ovate, middle lobe ovate to orbicular, all lip pubescent inside; stems 6-15

- cm. high, rather stout; leaf elliptical-oblong, apex rounded or subacute, 10-25 cm. long, 1-3 cm. broad; inflorescence 4-18 cm. long, simple or with a few very short branches [49. *galeata*](#)
- Dorsal sepal 7 mm. long or less: **14**
- 14** Leaves oblong-oblancoate, oblong or elliptical-oblong, suddenly narrowed at base and thus appearing cordate, 1-5 cm. broad, up to 23 cm. long; pseudobulbs tapering from the base, narrowly cylindrical to conical, 0.7-1.7 cm. long; inflorescence up to 22 cm. long, usually paniculate in the upper part; bracts with a broad thin base, suddenly narrowed into a slender point, up to 5 mm. long; dorsal sepal 4-6.5 mm. long; lip obscurely trilobed, 4-6 mm. long, side lobes rounded, middle lobe ovate, apiculate or acuminate, disk with callus running from base to centre [50. *cultriformis*](#)
- Leaves 12 mm. or less broad, narrowed gradually at base and not at all cordate; stems very slender, not tapering, up to 18 cm. long; bracts small, triangular, of even texture, not exceeding 2 mm. in length: **15**
- 15** Dorsal sepal 4-7 mm. long; mentum 9-12 mm. long; side lobes of lip rounded, obscure; leaves narrowly elliptical-oblong, gradually tapering towards base, 5-16 cm. long, 6-12 mm. broad; inflorescence much shorter than the leaves, 2-6-flowered; lip 9-11 mm. long, with a long claw, middle lobe more or less orbicular [48. *supfiana*](#)
- Dorsal sepal 1.5-3 mm. long; mentum 2.6-4.5 mm. long; lip ecallose, side lobes nearly as long as front lobe, incurved, acute or obtuse; inflorescence up to 20 cm. long, with 4-8 short branches: **16**
- 16** Leaves more or less terete with a groove along the upper surface, 1-3 mm. diam., 12-22 cm. long; lip 2.5-4 mm. long, 2-5 mm. broad, front lobe broadly ovate or orbicular [51. *tenuissima*](#)
- Leaves narrowly oblong or linear, unequally bilobed at apex, 5-14 cm. long, 3-6 mm. broad; claw of lip longer than the limb, front lobe orbicula [52. *inconspicua*](#)
- 17** Pseudobulbs ellipsoid to longly cylindrical, 6-19 cm. long, more or less flattened, thicker in the middle, 1-1.5 cm. thick, 3-5-leaved in the upper half; leaves oblong or oblong-elliptical, rounded and shortly bilobed at apex, 8-30 cm. long, 1.5-4 cm. broad; inflorescence paniculate, 9-25 cm. long, with several large sheathing bracts at the base, branches long, only rarely branched again; flowers yellowish to reddish-orange; sepals 3-4 mm. long; lip entire, elliptical-ovate, subacute, 3 mm. long [1. *paniculata*](#)
- Pseudobulbs or stems, if elongated, not more than 1 cm. diam., if thickened, short and often somewhat conical, the leaves arising in a tuft: **18**
- 18** Bracts longly setaceous-subulate from a very short broad base, usually spreading or reflexed; flowers small, dorsal sepal 2-4 mm. long: **19**
- Bracts short, lanceolate or very broad, obtuse or acute or sometimes with a short slender point, if with a long point then the dorsal sepal over 4 mm. long; flowers large or small: **23**
- 19** Inflorescence simple with no arrested branches in the axils of the lower bracts; leaves strap-shaped: **20**
- Inflorescence branched, the branches sometimes represented by buds in the axils of the lower bracts; lip without calli: **22**
- 20** Lateral sepals long-acuminate; callus on lip absent or consisting of a fleshy central cushion; petals linear, lanceolate or oblanceolate, acute: **21**
- Lateral sepals acute only; calli on lip basal, paired, bow-shaped, converging at base and in front; petals ovate or elliptical, obtuse; pseudobulbs 3-7.5 mm. long, 2-4-leaved; leaves 3-12 cm. long, 3-8 mm. broad; raceme 3-13 cm. long; sepals 2.5-3.5 mm. long; lip hastate in outline, side lobes small, acute, recurved, middle lobe lanceolate [23. *calluniflora*](#)
- 21** Side lobes of lip oblong-elliptical or elliptical-orbicular, broader than front lobe, latter sharply recurved, lanceolate, acuminate, disk setose or glabrous; pseudobulbs 1-5 cm., rarely to 9 cm., long; leaves 4-20 cm. long, 4-14 mm. broad; inflorescence 3-14 cm. long; dorsal sepal 2.5-4 mm. long [26. *adansoniae*](#)
- Side lobes of lip spreading, narrowly triangular-oblong, acute, much smaller than the middle lobe, latter broadly triangular, oblong or almost orbicular, acute or apiculate; pseudobulbs 3-18 cm. long; leaves 7-32 cm. long, 1-2.2 cm. broad; inflorescence 7-22 cm. long; dorsal sepal 2-2.5 mm. long [27. *polychaete*](#)
- 22** Stem more or less elongated, the leaves arising some distance from the base, lower part covered with sheaths; leaves strap-shaped or lanceolate-oblong, widest about or below the middle, up to 15 cm. long, 5-16 mm. broad; dorsal sepal 2-2.5 mm. long; lip obscurely 5-lobed, the lowermost pair of lobes infolded, densely pubescent outside, the front lobe broadly deltoid or rounded triangular; plant up to 30 cm. tall [19. *elegans*](#)
- Stem short, the leaves arising close together in a basal tuft, their bases covered by overlapping chaffy sheaths; leaves oblanceolate, widest in upper part, 3-8 cm. long, 4-20 mm. broad; dorsal sepal 3-4 mm. long; lip 3-lobed in upper half, pubescent inside, side lobes rounded, front lobe triangular-ovate, acute or shortly acuminate; plant up to 12 cm. tall [20. *coriscensis*](#)
- 23** Stems slender, elongated, not thickened at the base, with no foliage leaves in the lower part which is covered by sheaths and the leaves scattered more or less regularly along the whole length above: **24**
- Stems usually short, often thickened at base to form a more or less conical pseudobulb, internodes short so that the leaves are borne in a tuft near the base; if stem elongated the lowest foliage leaf-base arises from base of stem (this leaf may sometimes be somewhat reduced): **33**

- 24 Plant small, 4-11 cm. high, including inflorescence; leaves narrowly oblong, 1-2 cm. long, 1-2 mm. broad, erect; dorsal sepal 1 mm. long; stems slender 1.5-4 cm. high, 2-6-leaved; inflorescence overtopping the leaves, peduncle thread-like, simple or much branched, racemes very short, up to 10-flowered; lip entire, rhombic, acute, 1-75 mm. long [22. seticaulis](#)
- Plant much taller, 12-50 cm. high, including inflorescence, or with hanging stems up to 75 cm. long; leaves over 4 cm. long and usually much longer, over 5 mm. broad; dorsal sepal over 2.5 mm. long: 25
- 25 Rhachis of branches of inflorescence and of terminal spike markedly zigzag with the very broad bracts distichously arranged at the angles; inflorescence usually with few branches, entirely glabrous; leaves more or less oblanceolate or elliptical-oblanceolate, broader above the middle; lip (spread out) as broad as long or broader than long, with broad central callus; capsules 3-3.5 cm. long: 26
- Rhachis of branches of inflorescence and of terminal spike not zigzag, bracts not distinctly in two rows: 27
- 26 Leaves 1.5-5 cm. broad, 6-17 cm. long, thin in texture and somewhat undulate, much tapering towards base; dorsal sepal 8-11 mm. long; lip about as broad as long, side lobes large, rounded; stem 15-35 cm. tall, 3-6-leaved [3. caloglossa](#)
- Leaves 0.8-2 cm. broad, 6-12 cm. long, thinly coriaceous, not undulate; dorsal sepal 6 mm. long; lip broader than long, side lobes triangular-ovate; stem 5-18 cm. tall, 3-5-leaved [5. fractiflexa](#)
- 27 Flowers pubescent; bracts of inflorescence small, spreading, acuminate; vegetative stems 7-25 cm. long, 2-6-leaved; lip with large rounded side-lobes and triangular or ovate acute middle lobe: 28
- Flowers glabrous: 29
- 28 Inflorescence usually a spreading panicle with rather long slender branches, 4-30 cm. long; branches rarely reduced to short tufts; leaves oblanceolate or oblanceolate-elliptic, 1.5-5.5 cm. broad, 8-26 cm. long; dorsal sepal 5-9 mm. long; lip as broad as long [6. laxiflora](#)
- Inflorescence a narrow panicle with short dense-flowered branches, 7-30 cm. long; leaves narrowly lanceolate, oblong-lanceolate or ligulate, 1-3 cm. broad, narrowing gradually towards apex; dorsal sepal 6.5-10 mm. long; lip longer than broad [7. stricta](#)
- 29 Lip middle lobe triangular, acute or obtuse, not reflexed, callus in centre of lip, side lobes rounded; rhachis glabrous; inflorescence simple or with up to 4 branches: 30
- Lip middle lobe rounded or retuse at apex, callus basal; lip distinctly longer than broad, side lobes much smaller than middle lobe, triangular or ligulate: 32
- 30 Leaves very narrowly to elliptical-lanceolate, up to 22 mm. broad; lip up to 8 mm. long, mid lobe not long pointed: 31
- Leaves elliptic or lanceolate-elliptic 20-30 mm. broad; lip 16 mm. long [4. cooperi](#)
- 31 Leaves lanceolate or elliptical-lanceolate, acute at apex, 5.5-14 cm. long, 6-22 mm. broad; stems erect, 11-30 cm. tall; lip distinctly longer than broad, about 6 mm. long [2a. albescens subsp. albescens](#)
- Leaves very narrowly lanceolate, very acutely 2-3-lobed at apex, 8-17 cm. long, 4-11 mm. broad; stems pendulous, up to 30 cm. long; lip about as broad as long, 6.5-8 mm. long [2b. albescens subsp. angustifolia](#)
- 32 Mentum or chin of flower longer than the dorsal sepal, conical, obtuse, 5.5-8 mm. long; stems more or less stiffly erect, 10-50 cm. high, slender, 4-12-leaved; leaves linear-lanceolate, 4-16 cm. long, 4-15 mm. broad, apex broadly if sometimes acutely bilobed; inflorescence unbranched, 4-12 cm. long; dorsal sepal 2.5-4.5 mm. long; lip oblong, 3-lobed above the middle, 6-9 mm. long, side lobes small, acute, front lobe oblong, lip with large more or less orbicular hairy callus at base and small tooth in centre just in front [8. bifida](#)
- Mentum shorter than the dorsal sepal, rounded conical, 3-5 mm. long; stems rather flaccid and flexuous, 12-40 cm. long, 4-11-leaved; leaves narrowly lanceolate, 5-21 cm. long, 5-23 mm. broad, apex acute, very narrowly bilobed; inflorescence simple or more usually somewhat branched, 4-12 cm. long; dorsal sepal 5-7 mm. long; lip 3-lobed at base, 5-7.5 mm. long, lateral lobes spreading, narrow, middle lobe much larger, broadly cuneate [9. rhodoptera](#)
- 33 Inflorescence branched, the branches sometimes arrested and represented by short shoots in the axils of the lower bracts (rarely quite simple inflorescences may be found on individual shoots): 34
- Inflorescence simple, no arrested branches in axils of lower bracts: 47
- 34 Stems leafless or almost so at time of flowering, swollen at the base to form a conical pseudobulb; leaves linear or ligulate, up to 2 cm. broad; scape enveloped in tight chaffy sheaths: 35
- Stems leafy at time of flowering; leaves oblong, lanceolate or oblanceolate, usually over 1 cm. broad; flowers rather fleshy; lip usually distinctly 3-lobed, never bearing long clavate hairs: 37
- 35 Dorsal sepal 6-7.5 mm. long: 36
- Dorsal sepal 3.5-4 mm. long; lip distinctly trilobed, more or less cruciform, middle lobe much recurved, side lobes shorter, erect, centre with whitish mealy hairs; flowers rather fleshy, yellow or greenish-yellow, sometimes with red markings; scape rather stout, 4-25 cm. long, branches of inflorescences up to 7, rather stout, less than 2 cm. long; leaves ligulate, 3-10 mm. broad; rhachis pubescent, flowers almost glabrous [24. steudneri](#)

- 36** Rhachis, ovary and sepals almost or quite glabrous; lip oblong in shape with a very obscure rounded lobe on each side at the middle, bearing numerous long clavate hairs; flowers thin in texture, purplish red; scape very slender, 15-50 cm. high, branches of inflorescence slender, sometimes branched again at the base, up to 7 cm. long; leaves linear, up to 4 mm. broad [54. bequaertii](#)
- Rhachis and sepals pubescent, ovary densely so; lip trilobed with large rounded side-lobes, with short clavate hairs on the disk; flowers rather fleshy, greenish white, middle lobe of lip yellow; scape rather stout, branches stout, up to 7 cm. long; leaves ligulate, 1.5-1.8 cm. broad [25. kingii](#)
- 37** Branches of inflorescence secund (all turning to the same side of the rhachis) or almost so: **38**
- Branches of inflorescence not secund, sometimes represented by a single short branch: **41**
- 38** Lip without a distinct longitudinal keel in the lower part but with a cushion of short mealy hairs; leaves usually 0.5-1.5 cm. broad, rarely up to 3 cm.: **39**
- Lip with a distinct keel running from the base to the middle or above; leaves 1-6 cm. broad, usually over 1.5 cm.; inflorescence up to 80 cm. high, usually over 15 cm.: **40**
- 39** Leaves fleshy, narrowly oblong with almost parallel sides, V-shaped in section, apex broad, obtusely bilobed, 4-18 cm. long, 5-30 mm. broad; inflorescence 6-35 cm. high with up to 8 laterals; laterals up to 5 cm. long, many-flowered; upper part of sheaths on rhachis tight; dorsal sepal 1.5-3 mm. long; lip trilobed, 2.5-3 mm. long, side lobes ovate, rather incurved, middle lobe elliptical, retuse [34. golungensis](#)
- Leaves thin in texture, narrowly oblanceolate or oblong-oblanceolate, not markedly V-shaped in section, apex narrow, rounded or acute, up to 20 cm. long, 5-22 mm. broad; inflorescence up to 15 cm. high with up to 6 laterals; laterals up to 2 cm. long; upper part of sheaths on rhachis rather loose; dorsal sepal 2.5-3.5 mm. long; lip trilobed, 3-4.5 mm. long, side lobes rounded, middle lobe elliptical-quadrate, bullate [33. modesta](#)
- 40** Leaves narrowly elliptical-lanceolate, acutely bilobed at apex, 1-3.5 cm. broad, 7-30 cm. long; dorsal sepal 3.5-5 mm. long; lip 3-lobed at apex only, 4-7 mm. long; lobes almost the same in length, middle lobe very broadly deltoid-semiorbicular, apiculate, margins very undulate, with a small keel in the centre separate from the basal one; stem somewhat elongated; branches of inflorescence up to 7, rarely branched again [32. mukandaensis](#)
- Leaves oblanceolate or oblong-elliptical, obtusely or subacutely bilobed at apex, 1.5-6 cm. broad, 6-30 cm. long; dorsal sepal 2.5-4.5 mm. long; lip 3-lobed at the middle, 4-5.5 mm. long, middle lobe oblong or almost orbicular, much longer than the laterals, with the margin undulate towards the base, no keel at the apex; branches of inflorescence up to 14, frequently branched again near the base [31. tessellata](#)
- 41** Lip entire, narrowly oblanceolate, apex acuminate, 5-6 mm. long, scarcely 2 mm. broad, with a bilobed basal callus; sepals densely pubescent, narrowly lanceolate, about 7 mm. long; leaves lanceolate or narrowly lanceolate to 6 cm. long, 3-14 mm. broad, very acutely bilobed at apex [36. oblanceolata](#)
- Lip trilobed, lobes sometimes obscure but lip then nearly as broad as long, callus entire or absent: **42**
- 42** Lip without a callus; fruits 4-9 mm. long: **43**
- Lip with a callus at the base or in the centre; fruits 9-18 mm. long: **44**
- 43** Dorsal sepal 2.5-3.5 mm. long; inflorescence with 1-6 short side branches not much diverging from the main axis and up to 2 cm. long; lip 3-4.5 mm. long, side lobes rounded, middle lobe elliptical-quadrate, bullate; leaves narrowly oblanceolate or oblong-oblanceolate, 5-22 mm. broad [33. modesta](#)
- Dorsal sepal 1.8-2 mm. long; leaves oblong-elliptical or oblanceolate, acute, 4-18 cm. long, 1-3 cm. broad; inflorescence a spreading compound panicle with slender many-flowered branches, 6-25 cm. high; lip 3-lobed in the upper half, 2.5-4 mm. long, margins incurved below, ecallose, side lobes spreading, rounded-triangular, middle lobe elliptical, smaller than the side lobes but projecting in front of them, 0.7-0.8 mm. long; fruits 4-8 mm. long [28. ramulosa](#)
- 44** Panicle large with spreading branches, 13-40 cm. high; side lobes of lip incurved, acute, middle lobe oblong, refuse at apex; leaves oblanceolate or rarely almost linear, acute, 5-30 cm. long, 0.5-4.5 cm. broad: **45**
- Panicle small with erect or suberect branches, 4-24 cm. high; side lobes of lip rounded, sometimes rather obscure, not incurved, middle lobe triangular, ovate or elliptical, acute or apiculate at apex: **46**
- 45** Dorsal sepal 3-4 mm. long; lip 4-4.5 mm. long, front lobe nearly quadrate or longer than broad, callus short, central, not continuous to the base; fruits 9-12 mm. long [29. puberula](#)
- Dorsal sepal 4.5-5 mm. long; lip 6-7.5 mm. long, front lobe transversely oblong, broader than long, callus a linear keel extending from the base to the centre; fruits 12-18 mm. long [30. odorata](#)
- 46** Rhachis and flowers densely pubescent; leaves of young growth not properly developed at time of flowering; leaves narrowly oblong, apex obtusely bilobed, 8-30 cm. long, 1.2-2.2 cm. broad; dorsal sepal 3.5-6 mm. long; lip 5-7.5 mm. long, 3-4.6 mm. broad; fruits 10-15 mm. long [35. dolichophylla](#)
- Rhachis more or less pubescent, flowers almost or quite glabrous; leaves of young growth fully expanded at time of flowering; leaves ligulate or oblanceolate, apex acute, acutely bilobed, 6-21 cm. long, 0.6-3 cm. broad; dorsal sepal 3.5-5.5 mm. long; lip 4.5-5 mm. long, 2.7-4.5 mm. broad; fruits 9-12 mm. long [37. subulata](#)
- 47** Sepals densely pubescent, narrowly lanceolate, about 7 mm. long; mentum very short; lip oblanceolate, acuminate, with bilobed basal callus and central hair-cushion, 5-6 mm. long; plant up to 7 cm. high; leaves lanceolate-linear or lanceolate, up to 6 cm. long and 3-14 mm. broad, very acutely 2-lobed at apex [36.](#)

oblanceolata

- Sepals almost or entirely glabrous; mentum quite prominent, cylindrical, conical or rounded, often longer than the dorsal sepal: 48
- 48 Flowering scapes 30 cm. or more in height, the peduncle almost covered with chaffy sheaths, the rachis many-flowered; flowers pale mauve with one or more yellow cushions of hairs on the lip, thin in texture; lip bent back like a knee in the middle; dorsal sepal 2.5-4 mm. long: 49
- Flowering scape 20 cm. or less in height, usually much shorter: 50
- 49 Lip with a short keel-like callus just above the base and two parallel almost touching hair cushions in the centre; stems leafless at time of flowering; sepals each with a horn-like projection on the back just below the tip; apical part of lip (epichile) bent upwards, broadly orbicular or transversely elliptical with a wavy margin; leaves narrowly strap-shaped, up to 10 cm. long and 1 cm. broad [11. pseudo-disa](#)
- Lip without any callus in basal part but with a single hair-cushion stretching right across the centre; leaves present at time of flowering; sepals without horn-like projections at the back; epichile of lip not bent upwards, more or less bifid or bilobed; leaves 2-4 to each stem, very narrowly lanceolate or strap-shaped, 10-16 cm. long, 4-8 mm. broad [12. geniculata](#)
- 50 Flowers borne on leafless pseudobulbs: 51
- Flowers borne on leafy pseudobulbs, usually rather fleshy; sepals without a horn-like projection below the apex: 58
- 51 Sepals rather fleshy, hairy outside; ovary densely pubescent; flowers greenish white; middle lobe of lip yellow, disk and lobes with numerous hairs but these not forming dense hair cushions; sepals 6-7 mm. long; lip distinctly 3-lobed, lobes nearly equal; leaves ligulate, 3-12.5 cm. long, 1.5-1.8 cm. broad [25. kingii](#)
- Sepals thin in texture, quite glabrous, frequently with a horn-like projection just below the apex; ovary glabrous or rarely with very few scattered hairs; flowers white, rose or lilac; disk of lip with 1 or 2 dense cushions of yellow hairs; roots often flattened, frequently green and assimilating: 52
- 52 Lip not sharply reflexed, 5-5.5 mm. long, lower part (hypochile) more or less concave, orbicular from a narrow base, 4-4.5 mm. long, with 2 hairy cushions in the upper part and a tooth-like callus at the base, apical part (epichile) more or less inflexed, transversely oblong or semi-orbicular, margins much undulate; dorsal sepal 3.5-4 mm. long; mentum 6.5 mm. long [10. dalzielii](#)
- Lip sharply reflexed below the middle: 53
- 53 Lip without a callus or keel at the base and with a single cushion of hairs in the upper part: 54
- Lip with a callus or keel at the base, reflexed just at base of cushions of hairs, hair-cushions 2, elongated, contiguous or separated: 55
- 54 Lip not hollowed out at apex, 7 mm. long, 3-lobed, side lobes spreading, linear, 1.5 mm. long, middle lobe much larger, oblong-elliptical, rounded at apex, with a single cushion of hairs in the centre; dorsal sepal 3 mm. long; mentum 4-4.5 mm. long; inflorescence 5-8 cm. long, many-flowered [13. monolenis](#)
- Lip hollowed out at apex into a sac or hood, 4 mm. long, entire, pandurate-oblong with a narrow claw, sac furnished with a large transversely elliptical cushion of hairs; dorsal sepal 2.5 mm. long; mentum 3 mm. long; inflorescence 4-12 cm. long [14. saccata](#)
- 55 Mentum of flower curved, 10-11 mm. long; lip 15-17 mm. long (stretched straight), claw narrow, 4-5-5 mm. long, middle part (mesochile) with obtusely triangular side lobes, hair-cushions contiguous, epichile orbicular, more or less emarginate at apex, inflexed, 4-5 mm. diam.; dorsal sepal 6-7 mm. long [15. elastica](#)
- Mentum scarcely curved, 6-9 mm. long; lip 8.5-13 mm. long: 56
- 56 Claw widened or lobed below the hair-cushions: 57
- Claw not widened below the hair-cushions, which are at broadest part of lip and do not reach the margins; epichile more or less orbicular, margin dentate [18. victoriae](#)
- 57 Callus at base of lip forming a high quadrate keel; hair-cushions separate, reaching nearly to the edges of the mesochile; epichile flabellate, not truncate at the base [16. pobeguinii](#)
- Callus at base of lip tooth-like, not much elevated; claw of lip frequently with narrow lateral lobes; hair-cushions contiguous, with a broad glabrous border to the mesochile; epichile transversely oblong or semi-orbicular, basal angles truncate [17. reflexa](#)
- 58 Mentum narrow, more or less cylindrical, slightly longer than or equalling the dorsal sepal; leaves narrowly ligulate or linear-oblong, rounded and shortly bilobed at apex, up to 1.2 cm. broad; inflorescence short, up to 10-flowered: 59
- Mentum broad, rounded-conical, considerably longer than the dorsal sepal; leaves lanceolate or oblanceolate, acute at apex, 1-3 cm. broad, 8-20 cm. long; inflorescence 9-30 cm. long, many-flowered, bracts much shorter than the ovary and pedicel; stem up to 5 cm. long, 3-5-leaved; lip more or less obovate, acutely 3-lobed at apex, 4.5-6.5 mm. long [38. leonensis](#)
- 59 Claw (narrow basal part) of lip hairy outside, upper part ovate or elliptical with a large 2-4-6-lobed flat callus wider than the lamina; dorsal sepal 5.5-6.5 mm. long; stems erect, 2-7 cm. high, swollen (0.5-1 cm. diam.) at

base; leaves 2.5-9 cm. long, 3-12 mm. broad; inflorescence up to 9 cm. long[21. alpina](#)

Claw of lip glabrous, upper part distinctly 3-lobed, middle lobe broadly ovate or almost orbicular, side lobes rounded triangular, decurrent on to the longer middle lobe, no callus; dorsal sepal 4-5.5 mm. long; stems 1-2 cm. high, forming ovoid pseudobulbs in the lower part; leaves 2-7 cm. long, 1-7 mm. broad; inflorescence up to 5 cm. long[39. parva](#)

1. *Polystachya paniculata* (Sw.) Rolfe in F.T.A. 7: 113 (1897). *APD acc*

Flowers orange with red markings.

Guin.: Nzo (fr. Mar.) Chev. 21051! **S. L.:** Afzelius! Kékédou to Kissidougou (Oct.) Jaeger 2162! **Lib.:** Ganta, Busi road (Nov.) Harley 1836! **Ghana:** Aburi Hills (Nov.) Johnson 483! 46. **Polystachya crassifolia** *Schltr.* in EngL, Bot. Jahrb. 38: 7 (1905).

APD: *Synonym of Polystachya mystacioides De Wild.*

A creeping epiphyte with pale brownish flowers.

W. Cam.: Moliwe (Jan.) Schlechter 12841!

47. **Polystachya mystacioides** *De Wild.* Not. Pl. Util. Congo 1: 133(1903); Kraenzl. in Fedde ep., Beih. 39: 10(1928). *APD acc*

A creeping or hanging epiphyte; flowers white with red or purplish markings.

IV. C.: Tai Forest (Oct.) Aké Assi 6030!

Also in **E. Cameroun** and **Congo**.

48. *Polystachya supfiana* *Schltr.* in Engl., Bot. Jahrb. 38: 10, fig. 4 (1905). *APD acc*

Flowers yellow with brown markings.

S. Nig.: Oban Talbot! Kwa R. (Mar.) Talbot 440! Eket Talbot 3306! **W. Cam.:** Bibundi (Apr.) Schlechter 12415!

Also in **Gabon**.

49. *Polystachya galeata* (*Sw.*) *Rchb. f.* in Walp. Ann. 6: 637 (1863). *APD acc*

Dendrobium galeatum *Sw.* (1805).

Polystachya grandiflora *Lindl.* (1839)-F.T.A. 7: 127; Chev. Bot. 817.

Flowers large, helmet-shaped, white, green, yellow or yellow-green with red or purplish markings.

25. STOLZIA

Schltr. in Engl., Bot. Jahrb. 53: 564 (1915).

- 1 Peduncle very slender, setaceous, 2-3 cm. long; sepals and petals very long acuminate, 5-5-7 mm. long; leaves oblanceolate, 1-2 cm. long, distinctly narrowed towards base; flowers greenish-white; pseudobulbs more or less globose with depressed centre so as often to appear bilobed [1. elaidum](#)

Peduncle rather stout, very short, scarcely exceeding 5 mm.; sepals and petals obtuse or acute, 3-7 mm. long; leaves elliptical or nearly orbicular, almost sessile, 5-12 mm. long, not at all narrowed at base; flowers orange, ochre-coloured or reddish, often with darker red stripes; pseudobulbs scarcely thickened, club-shaped [2. repens](#)

1. *Stolzia elaidum* (Lindl) Summerh. in Kew Bull. 17: 567 (1964). *APD acc*

Bulbophyllum elaidum Lindl. (1862)-F.T.A. 7: 29; F.W.T.A., ed. 1, 2: 439.

A low creeping epiphyte with spaced-out pseudobulbs bearing pairs of leaves and single greenish white flowers.

Lib.: Duport (Nov.) Linder 1495! Begwai to Peter's Town (Oct.) Bunting 100! Jaurazon, Sinoe (Mar.) Baldwin 11473! **S. Nig.:** Brass R. Barter 73! 1841!

Also In **Principe**.

2. *Stolzia repens* (Rolfe) Summerh. in Kew Bull. 7: 141 (1963). *APD acc*

Polystachya repens Rolfe in Kew Bull. 1912: 132.

A low creeping plant with pairs of leaves at intervals and single orange or red flowers.

S. Nig.: Sapoba, Jamieson R. (Sept., Dec.) Onochie FHI 34269! Sanford 146/66! **W. Cam.:** Bamenda, 6,000 ft. Gregory 267!

Also in **Congo, Uganda, Kenya, Tanzania** and **Zambia**.

26. CALANTHE

R. Br. in Edw., Bot. Reg- t. 573 (1821); F.T.A. 7: 45. Nom. cons.

- 1 Rhizome stout; leaves 3-5, long-petiolate, lanceolate or elliptical-lanceolate, acuminate, lamina 15-35 cm, long, 4-13 cm. broad, petiole 10-17 cm. long, dilated at the base; inflorescence erect, 30-75 cm. high; flowers white, mauve or pink; sepals oblong-lanceolate, acute, 12-18 mm. long; lip trilobed at the base, 8-14 mm. long, side lobes short, rounded, front lobe divaricately bilobed with a short claw, side lobules oblong, more or less toothed on the outside, disk with a warty crest in front of the column, spur 12-28 mm. long, slender [corymbosa](#)

Calanthe corymbosa Lindl. in J. Linn. Soc. 6: 129 (1862); F.T.A. 7: 46.

APD: *Synonym of Calanthe sylvatica* (Thouars) Lindl.

APD: *Synonym of Calanthe sylvatica* (Thouars) Lindl. var. *sylvatica*

Calanthe delphinioides Kraenzl. (1893)-T.T.A. l.c.

Terrestrial, in forests.

Also in **Uganda**.**28. BULBOPHYLLUM***Thou.*, Orch. Iles. Austr. Afr. tt. 93-97 (1822); F.T.A. 7: 22, including *Megaclinium* Lindl. Nom. cons.

- 1 Pseudobulbs normally 1-leaved: (to p. 230) **2**
- Pseudobulbs normally 2-leaved, rarely 3-leaved (weak plants may have some of the pseudobulbs 1-leaved): (from p. 226) **29**
- 2 Leaves terete, over 15 cm. long, 1.5-2 mm. diam.; pseudobulbs narrowly cylindrical, 2.5-3 cm. long; scapes much shorter than leaves, flowering nearly from base, rhachis rather swollen but not much flattened, bracts 2 mm. long [14. teretifolium](#)
- Leaves flat: **3**
- 3 Lip with pink, red or brown hairs at least as long as half the width of the lip and usually much longer, linear or tongue-shaped; sepals nearly similar to each other, narrowly lanceolate, 6-18 mm. long; petals linear-subulate, quite glabrous; column with long subulate stielidia: **4**
- Lip glabrous, papillose, or if ciliate or hairy the hairs colourless: **9**
- 4 Longer hairs on lip with club-shaped swollen ends; pseudobulbs much flattened, elliptical or circular in outline, 1.5-3 cm. long, 1.5-2.7 cm. broad; inflorescence 9-20 cm. long, laxly many-flowered, bracts spreading; leaves oblong or elliptical, 2.5-11 cm. long, 1-2.8 cm. broad [28. barbigerum](#)
- Longer hairs on lip not club-shaped or swollen at ends; bracts not spreading: **5**
- 5 Inflorescence shorter than the leaves, 5-9 cm. long, densely flowered in the upper half or two-thirds; flowers all open at once; sepals 6-7 mm. long; pseudobulbs ovoid, or conical-ovoid, flattened, obscurely 3-4-angled; leaves elliptical or oblong, 4-5-12 cm. long, 1.5-2.5 cm. broad; bracts 5-7 mm. long; lip with a shallow U-bend in the middle [23. saltatorium](#)

- Inflorescence longer, usually much longer, than the leaves, 15-60 cm. long, flowering in the upper half or quarter only; flowers opening singly or a few out together; sepals over 7 mm. long; lip without a shallow U-bend in the middle: **6**
- 6** Bracts 4-15 mm. long, 2-4 mm. broad, greenish; flowers opening singly; leaves 7-19 cm. long, 1.5-4 cm. broad; hairs on lip deep red or purplish; pseudobulbs conical or ovoid, those first produced lenticular, later ones 3-4-angled, 1-4 cm. long, 1-2.5 cm. diam.; base of lip fleshy: **7**
- Bracts 17-30 mm. long, 6-10 mm. broad, yellow, pink or orange; several flowers open at once, or rarely flowers opening singly; leaves 15-30 cm. long, 2.5-5.5 cm. broad; hairs on lip red-brown, purplish-brown or chocolate; pseudobulbs ovoid, 3-4-angled, 2-4 cm. long, 1.5-3 cm. diam.: **8**
- 7** Longer hairs on lip arising from underside of margins only, margins densely pubescent, upper surface glabrous; lip tongue-shaped, fleshy [25. calamarium](#)
- Longer hairs on lip arising from margins both above and beneath and also from the surfaces; lip linear, not very fleshy, often with 2 reflexed papillose more or less hyaline auricles on the fleshy base just above the point of attachment [24. distans](#)
- 8** Petals 6.5-7.5 mm. long [26. phaeopogon](#)
- Petals 4.5-5.2 mm. long [27. schinzianum](#)
- 9** Sepals with long hairs, 8-11 mm. long; petals lanceolate or spatulate-lanceolate, densely papillose, 3-4 mm. long; lip very fleshy, densely papillose; stelidia of column obtuse; rhachis more or less swollen and fleshy, pendulous: **10**
- Sepals glabrous or very shortly papillose, or pubescent: **11**
- 10** Sepals hairy over the whole surface, only slightly keeled at back; scape 6-13 cm. long; leaves 10-24 cm. long, 1.3-2.7 cm. broad [16. comatum](#)
- Sepals with prominent hairy keels on outside, otherwise only pubescent; scape 3.5-7.5 cm. long; leaves 8-11 cm. long, 1.6-4 cm. broad [17. inflatum](#)
- 11** Rhachis fleshy and more or less flattened; bracts reflexed after flowering; scape 15-45 cm. long, robust: **12**
- Rhachis terete, not or only slightly thicker than the peduncle; bracts sometimes spreading but not reflexed: ... **14**
- 12** Rhachis flattened, not very fleshy, 5-12 mm. wide; bracts very narrow, subulate from a broader base, 3-6 mm. long; pseudobulbs flattened, ovoid or ellipsoid, 3-4-angled, 1-6 cm. long; leaves oblong-elliptical, 4-21 cm. long, 8-34 mm. broad; sepals acuminate, dorsal 1 cm. long; lip very fleshy with often serrulate keels; scape 20-45 cm. long; column with broad rounded wings [57. colubrinum](#)
- Rhachis fleshy, not much flattened, 4-7 mm. broad; bracts as broad as the rhachis, deltoid-ovate, obtuse; lip much curved, with rounded basal lobes, and a thin longitudinal keel underneath; lateral sepals falcate-ovate, recurved: **13**
- 13** Lip entire at the base; petals 1-8 mm. broad, 3-nerved, not papillose; dorsal sepal lanceolate, acute, 8.5 mm. long; pseudobulbs ovoid, 3-angled, 1-2 cm. long; leaves 7-9 cm. long, 1.5 cm. broad [62. magnibracteatum](#)
- Lip pectinate at the base; petals 0-6 mm. broad, 1-nerved, papillose; dorsal sepal lanceolate, 7.5 mm. long; pseudobulbs elongate-ovoid, 3-4-angled, 2-4 cm. long; leaves 10-20 cm. long, 1.3-2.2 cm. broad .. [65. linderi](#)
- 14** Pseudobulbs very small, not exceeding 1 cm. in length, usually spaced out on a slender creeping rhizome; leaves linear or narrowly ligulate, 3-7 mm. broad: **15**
- Pseudobulbs exceeding 1 cm. in length, adjacent to or at short distances from one another (occasionally small plants will have pseudobulbs less than 1 cm. long); leaves lanceolate, ligulate, oblong or elliptical, usually more than 1 cm. wide: **16**
- 15** Scape very slender, up to 18 cm. long, flowers up to 12, sometimes only 2 or 3, usually widely spaced; bracts usually very small, up to 3 mm. long, shorter than the flowers; leaves 1-10 cm. long; sepals 2.5-6 mm. long; petals oblong or broadly oblanceolate; lip entire or more or less trilobed at the base, the side lobes and margins often ciliate [15. intertextum](#)
- Scape stout, 2-5 cm. long, peduncle almost covered by overlapping sheaths; flowers in a dense spike; bracts 3-6 mm. long, nearly as long as the flowers; leaves 1.5-5 cm. long; sepals 4.5-6.5 mm. long; petals linear or linear-lanceolate; lip entire, papillose but not ciliate [8. pipio](#)
- 16** Lip trilobed at base, side lobes separated from larger middle lobe by narrow acute sinuses; column furnished with a sharp tooth-like projection at the base of each stelidium, and with a rounded knob-like projection in the centre of the foot; pseudobulbs 1.5-4 cm. long, conical-ovoid; leaves narrowly strap-shaped, 8-20 cm. long, 5-14 mm. broad; peduncle very short, inflorescence flowering nearly to base; sepals 3.5-6 mm. long; petals narrowly lanceolate, acute, 1-2.2 mm. long; lip lobes ciliate or denticulate [7. nigrisianum](#)
- Lip entire or with rounded very obscure basal lobes: **17**
- 17** Margins of lip entire or shortly papillose, not ciliate: **18**
- Margins of lip ciliate or ciliate, keels sometimes also ciliate or pubescent: **24**
- 18** Petals lanceolate or broadly lanceolate with a short stalk and markedly papillose margins; lip rounded and cordate at the base, very acute at the apex, with 2 calli near the base; peduncle very short, inflorescence

- flowering nearly to base, 8-24 cm. long; leaves elliptical, rounded at apex, 2-7 cm. long, 8-20 mm. broad; sepals 4-6.5 mm. long, white to pale yellow [9. buntingii](#)
- Petals not stalked; lip not cordate at base nor sharply acute at apex: **19**
- 19** Sepals 2.5-5 mm. long, broadly lanceolate; petals oblong or elliptical, 1.5- 2.5 mm. long; inflorescence flowering in upper half only; leaves elliptical-ob lanceolate, obtuse or acute at apex, 3-12 cm. long, 1-2 cm. broad; lip elliptical or ovate, rounded at base, papillose at apex [10. recurvum](#)
- Sepals exceeding 5 mm. in length, narrowly lanceolate: **20**
- 20** Stelidia shorter than the column (the latter measured from its base to the apex of the filament); petals oblong-lanceolate, acute: **21**
- Stelidia longer than the column; leaves oblanceolate or oblong, often narrowed for some distance at both ends; petals oblong, obtuse or sub-acute: **23**
- 21** Leaves with a marked petiole 1.5-3 cm. long, 11.5-20 cm. long, 1-3 cm broad; pseudobulbs narrowly ovoid or conical-ovoid, 2-3 cm. long sepals orange in apical part, lip pale orange; sepals 8-12 mm. long inflorescence 15-35 cm. long; petals 3.5-4.5 mm. long [4. josephii](#)
- Leaves with a short petiole 5-10 mm. long; pseudobulbs ovoid, up to 2.5 cm. long; sepals magenta, red-purple or pale yellow-green, lip deep magenta or red; inflorescence 11-20 cm. long: **22**
- 22** Sepals 6-7 mm. long, 1.5-2 mm. broad; leaves 7-12 cm. long, 1 cm. broad; petals 2.5-3 mm. long; sepals magenta or red-purple with white base, lip deeper magenta; pseudobulbs 1-1.5 cm. diam [5. modicum](#)
- Sepals 10 mm. long, 2.5-4 mm. broad; leaves 12-19 cm. long, 3-4.5 cm. broad; petals 5.5 mm. long; sepals pale yellow-green, lip red with yellow base; pseudobulbs 2-3 cm. diam. [6. calvum](#)
- 23** Flowers white, lip sometimes yellowish; sepals 6.5-10 mm. long, laterals suddenly widened at base; lip about the same width all along, more or less V-shaped in section; pseudobulbs ovoid, 1-2 cm. long; leaves oblanceolate or oblong, 4.5-12 cm. long, 1.3-2.3 cm. broad, obtuse or rounded at apex; scape 9-19 cm. long [2. schimperanum](#)
- Flowers greenish-yellow, sometimes tinged reddish or purplish or entirely red-purple; sepals 5-9 mm. long, widened gradually at base; lip narrowing towards the front and papillose; pseudobulbs conical or narrowly conical, 1-2.5 cm. long; leaves oblanceolate or narrowly oblong, 5-14 cm. long, 1-3 cm. broad, acute at apex; scape 7-18 cm. long [1. flavidum](#)
- 24** Sepals 2.5-5 mm. long: **25**
- Sepals 5-17 mm. long; inflorescence slender, 7-45 cm. in length, many-flowered: **28**
- 25** Sheaths on peduncle with loose swollen apex; flowers very densely placed; pseudobulbs ovoid, reddish with wrinkled surface; leaves lanceolate to oblanceolate, acute, 4-16 cm. long, 1-2.5 cm. broad; inflorescence shorter than the leaves; sepals triangular-lanceolate, laterals with much dilated front margin at base, 2.5-4.5 mm. long, pale at base, red or purple at apex; petals elliptical-oblong, apiculate, 1.5-2.5 mm. long; stelidia slightly longer than the column [12. winkleri](#)
- Sheaths on peduncle tight, not swollen at apex: **26**
- 26** Peduncle much shorter than the rhachis; inflorescence slightly longer, or shorter than the leaves; leaves oblong to oblong-lanceolate, 4-10.5 cm. long, 1-1.5 cm. broad; sepals narrowly lanceolate, 4-5 mm. long, cream-coloured; petals narrowly oblong, 1.8-2.5 mm. long; stelidia shorter than the column [13. porphyroglossum](#)
- Peduncle distinctly longer than the rhachis, often much longer; inflorescence 3-20 cm. long, as long as or usually longer than the leaves; stelidia longer than the column; petals oblong, 1.5-2.5 mm. long: **27**
- 27** Keels of lip glabrous; sepals greenish-yellow, tinged reddish, 2.3-5 mm. long; pseudobulbs ovoid or conical-ovoid, obscurely 4-angled, 1-2 cm. long; leaves elliptical-ob lanceolate, obtuse or acute, 3-12 cm. long 1-2 cm. broad; lip very shortly ciliate in the lower part, papillose near the apex [10. recurvum](#)
- Keels of lip pubescent or long-papillose; sepals dark red, obtuse, 3.2-4.7 mm. long; pseudobulbs ovoid, somewhat flattened, obscurely 2-3-angled, 1.3-2.5 cm. long; leaves oblong-elliptical, 4.5-15 cm. long, 1.3 cm. broad; lip densely ciliate all round [11. pavimentatum](#)
- 28** Inflorescence 14-45 cm. long; sepals long acuminate, 8.5-14 mm. long, white or cream-coloured, often flushed pink or purple; pseudobulbs ovoid, biconvex or 3-4-angled, 1.5-4 cm. long; leaves lanceolate or oblong-lanceolate, acute, 8-27 cm. long, 1-3 cm. broad; petals oblanceolate, denticulate, 2.5-3.5 mm. long [3. cocoinum](#)
- Inflorescence 7-18 cm. long; sepals acute or shortly acuminate, 5-9 mm. long, greenish yellow, sometimes tinged reddish or wine-coloured, or even almost entirely wine-coloured; pseudobulbs conical or narrowly conical, 1-2.5 mm. long; leaves oblanceolate or narrowly oblong, 5-14 cm. long, 1-3 cm. broad; petals oblong, obtuse or sub-acute, 1.7-2.8 mm. long [1. flavidum](#)
- 29** Lip hairy, hairs often very long; rhachis slender, not thicker or wider than the peduncle: **30**
- Lip glabrous, rarely papillose or with a few short cilia along the margins: **33**
- 30** Bracts short, 3-4 mm. long, not imbricate; hairs on lip in length less than half width of lip; sepals 4-6 mm. long; petals lanceolate or ligulate, acute or subacute, 1.5-2.5 mm. long; lip tongue-shaped from a broader fleshy base, 1.5-2.6 mm. long, ciliate; pseudobulbs narrowly conical or cylindrical, 2-4 cm. long, 3-13 mm. diam.;

- leaves oblong or narrowly oblong, 5-14 cm. long, 5-13 mm. broad; scape 10-16 cm. long [18. tenuicaule](#)
- Bracts large, broad and boat-shaped, 6-11 mm. long, spreading, and more or less imbricate; hairs on lip longer than half the width of the lip; lip ligulate from a narrower base: [31](#)
- 31** Scape 10-24 cm. long; leaves 4-20 cm. long: [32](#)
- Scape 35-60 cm. long; leaves 11-23 cm. long, 11-18 mm. broad; pseudobulbs conical-cylindrical, 8-12 cm. long, 7-12 mm. diam. at base; sepals 7-7.5 mm. long; petals falcate-ligulate, 2-2.7 mm. long; lip 4-4.5 mm. long [21. manni](#)
- 32** Pseudobulbs elongate-ovoid, 4-angled, 2-3.5 cm. long; leaves 6-12 cm. long, 5-8 mm. broad; sepals 6-7 mm. long; petals oblong-ligulate, 2-3 mm. long; lip 5.5 mm. long, 1.5 mm. broad, base very thick and fleshy [19. gravidum](#)
- Pseudobulbs narrowly cylindrical, sometimes slightly flattened, 2.5-10 cm. long, 3-15 mm. diam.; leaves 4-16 cm. long, 4-15 mm. broad; sepals 4-7.5 mm. long; petals subfalcate-lanceolate, fleshy, 1-2.5 mm. long; lip 2-7-5 mm. long, less than 1 mm. broad [20. cochleatum](#)
- 33** Bracts large, spreading, strictly distichous, often imbricate, more or less rigid, 6 mm. or more long, equalling or much longer than the flowers; rhachis often more or less angular or more or less flattened, but only a little wider than the peduncle: [34](#)
- Bracts less than 9 mm. long, spreading or reflexed; rhachis unthickened, or fleshy and thickened, or much flattened and broad: [39](#)
- 34** Lip very broad and short, almost orbicular, with fleshy centre and thin toothed margins: [35](#)
- Lip distinctly longer than broad, margins entire, sometimes with a few cilia: [37](#)
- 35** Bracts closely overlapping at time of flowering, boat-shaped, covering the flowers; lateral sepals connivent, not spreading; flowers white or greenish yellow with red or purple markings, or deep purple: [36](#)
- Bracts not closely overlapping at time of flowering, only slightly convex, the flowers easily visible; lateral sepals deflexed; flowers yellow with purple markings; pseudobulbs 4-6-angled, 4-5-6 cm. long; leaves elliptical-ligulate, 13-16 cm. long, 2-2.5 cm. broad [37. wrightii](#)
- 36** Rhachis and bracts with numerous short blackish or purplish scaly hairs; bracts fawn-coloured or pale brown, the margins straight or slightly convex; central part of lip not very fleshy, wings rather broad; leaves 10-23 cm. long, 1-8-4.5 cm. broad; scape 15-40 cm. long [38. lupulinum](#)
- Rhachis and bracts glabrous; bracts usually purple but rarely green the margins slightly concave so that apices appear incurved; central part of lip very fleshy, wings very narrow, apex tuberculate; leaves 6-16 cm. long, 1-3-2.3 cm. broad; inflorescence (including peduncle) 8-16 cm. long [39. porphyrostachys](#)
- 37** Pseudobulbs very narrowly conical or cylindrical, 4-12 cm. long, 3-8 mm. diam.; inflorescence distinctly secund with all flowers facing towards one side; bracts 6-7 mm. long; flowers nearly as long as the bracts, easily visible, reddish-brown or deep red; labellum tongue-shaped from a short fleshy base, sometimes very shortly ciliate in the lower part; sheaths of peduncle tight, acute; leaves linear-ligulate, 7-21 cm. long, 6-22 mm. broad; sepals blunt, 4-5.5 mm. long [22. bequaertii](#)
- Pseudobulbs ellipsoid or ovoid, with several sharp angles, 1-3 cm. diam.; flowers distichous; lip fleshy, recurved in middle or upper part: [38](#)
- 38** Petals orbicular-oblong, the apex rounded, entire; bracts rather rigid, straw-coloured, distinctly longer than the flowers; pseudobulbs 1.5-3.5 cm. long; leaves linear or linear-oblong, 3-12 cm. long, 6-10 mm. broad; flowers whitish or rose-coloured [35. bifarium](#)
- Petals broadly elliptical or oblong, 3-lobed at apex, the central lobe or tooth longest; bracts not very rigid, buff-coloured, about as long as the flowers; pseudobulbs up to 2.5 cm. long; leaves oblong-elliptical, up to 5.5 cm. long and 12 mm. broad; flowers green and purple [36. nigericum](#)
- 39** Pseudobulbs narrowly cylindrical, slightly tapering upwards, 5-10 cm. long, 6 mm. diam.; leaves broadly oblanceolate, 9-20 cm. long, 2-4 cm. broad; scape 30-40 cm. long, rhachis flattened into broad wings with undulate margins, about 1.5 cm. broad, flowers in a row along centre of each side of rhachis; bracts small, triangular, reflexed; floral parts unknown [47. longibulbus](#)
- Pseudobulbs ellipsoid, ovoid or conical-ovoid, frequently flattened or angular, up to 7 cm. long, but then not cylindrical, and much thicker: [40](#)
- 40** Lip pectinate in the lower half, entire above: [41](#)
- Lip not pectinate in the lower half: [44](#)
- 41** Rhachis much flattened with broad leaf-like wings on one or both sides of the midrib, 5-15 mm. broad; bracts narrow, triangular, acuminate; pseudobulbs sharply 3-4-angled, 2-7 cm. long; scape 18-40 cm. long; leaves 5-18 cm. long, 1-3-4 cm. broad; sepals acuminate, laterals recurved; petals glabrous, linear, curved: [42](#)
- Rhachis fleshy, only slightly flattened, 4-10 mm. broad; bracts almost as broad as the rhachis, ovate-triangular, obtuse; petals more or less papillose, linear, curved; dorsal sepal lanceolate, acute: [43](#)
- 42** Margins of rhachis markedly undulate; rhachis 1-1.5 cm. broad, the apex abruptly narrowed into a short point, the flowers arranged along a central line; dorsal sepal caudate-acuminate; labellum not much narrowed in front

- [59. maximum](#)
- Margins of rhachis not or scarcely undulate; rhachis 0.5-1.5 cm. broad, the apex gradually narrowed into a long blunt point, the flowers along the centre or frequently much nearer one edge; dorsal sepal acuminate; labellum distinctly narrowed in front, the apex much recurved [58. oxypterum](#)
- 43** Rhachis whitish-green, flowers orange and yellow; petals nearly as long as dorsal sepal, latter 6-9 mm. long; pseudobulbs ovoid, 3-4-angled, 3-7 cm. long; leaves 11-18 cm. long, 1-3 cm. broad; scape 15-35 cm. long [64. leucorrhachis](#)
- Rhachis green or purplish or blackish, flowers dull purple- or black-spotted on a green ground; petals distinctly shorter than dorsal sepal, latter 7-11 mm. long; pseudobulbs ovoid, rather flattened, 3-angled, 3-7 cm. long; leaves 8-21 cm. long, 1-3.5 cm. broad; scape 18-65 cm. long [63. imbricatum](#)
- 44** Bracts almost white, scarious, spreading, almost as long as the flowers, 4-8 mm. long; sheaths on peduncle similar, adpressed; lip fleshy, bent like a knee just below the middle; rhachis not widened, angular; dorsal sepal triangular-ovate, apiculate, 4-4.5 mm. long; petals obliquely orbicular-elliptical, rounded at apex, 4-4.5 mm. long, 3-3.5 mm. broad; leaves 1.5-8 cm. long, 5-12 mm. broad [34. scariosum](#)
- Bracts and sheaths not white and scarious; lip either fleshy and usually not curved (if so, then petals denticulate), or thin and often much recurved; petals linear, oblanceolate, oblong or ovate, obtuse to acuminate but not rounded at apex: **45**
- 45** Lip very fleshy, not much curved; lateral sepals not recurved in the upper part; flowers distichous; rhachis slender or if slightly flattened the flowers borne on the edges; scapes up to 15 cm. long but frequently much shorter: **46**
- Lip relatively thin and flat, often much curved, sometimes with a longitudinal keel running along the middle of the lower surface; lateral sepals usually, and frequently abruptly, reflexed in the upper half, more or less falcate; rhachis slender or variously flattened, in the latter case with the flowers borne along the flat surfaces; dorsal sepal frequently spathulate: **50**
- 46** Petals ovate, acute, denticulate, 4 mm. long; lip dorsally flattened, papillose at the base underneath, much folded down the centre; scape slender, rhachis quite unthickened, nodding; pseudobulbs ovoid, 4-5-angled, 3 cm. long; leaves oblong, 7-9 cm. long, 1-1.5 cm. broad; sepals 5-6 mm. long, papillose [29. denticulatum](#)
- Petals linear, obtuse, entire, 2-3.5 mm. long; scape erect or decurved, somewhat flattened and often winged; pseudobulbs oblong-ellipsoid, 4-angled, 1.5-4.5 cm. long; leaves elliptical or oblong-elliptical, 1.5-11 cm. long, 0.5-2 cm. broad; lip with 2 prominent smooth keels in the lower part: **47**
- 47** Rhachis, and to a less extent the sepals, more or less densely pubescent-papillose or velvety; lip slightly dorsally compressed; sepals 3-6 mm. long; stelidia entire, acute, curving forwards [32. fuscoides](#)
- Rhachis quite glabrous, the margins on which the flowers are borne more or less deeply canaliculate: **48**
- 48** Lip dorsally compressed, distinctly 3-lobed at the base, the side lobes triangular-ovate and slightly incurved; sepals 2.5-3.6 mm. long; flowers in inflorescence all open at same time [30. fuscum](#)
- Lip laterally compressed, side lobes reduced to very low ridges on the outside of the lip near the base; sepals 3-7 mm. long; only some flowers open at any time: **49**
- 49** Rhachis angled or narrowly winged, the wings quite entire; flowers somewhat incurved [31. oreonastes](#)
- Rhachis broadly winged, the wings toothed and continuous with the toothed base of the bract above; flowers spreading or somewhat recurved; pedicel and base of flowers usually deeply sunk in hollows between the wings [33. zenkeranum](#)
- 50** Petals filiform with a thickened club-shaped apex, resembling the antennae of a butterfly; dorsal sepal lanceolate-linear, acute, 10-12 mm. long, 1-2.5 mm. broad; pseudobulbs elongate-conical-ovoid, biconvex or 3-4-angled, 3-5 cm. long; leaves linear-oblong, 7-16 cm. long, 7-20 mm. broad; scape 12-25 cm. long with short loose sheaths on peduncle; rhachis swollen and more or less flattened, up to 14 mm. broad; bracts broadly ovate, often nearly as wide as the rhachis; lip with erect rounded side lobes [46. tentaculigerum](#)
- Petals linear, oblanceolate or oblong, obtuse or acuminate, not like antennae: **51**
- 51** Rhachis fleshy and swollen, somewhat flattened, not leaf-like; bracts broad, triangular-ovate, nearly as broad as the rhachis; leaves over 1.5 cm. broad; dorsal sepal linear-lanceolate, acute, never spathulate or oblanceolate; petals linear, nearly as long as the dorsal sepal: **52**
- Rhachis either slender unthickened or somewhat flattened, or widened on each side to form a flat thin leaf-like wing; bracts in the latter two cases distinctly narrower than the rhachis: **53**
- 52** Rhachis nearly terete, 2-3 mm. broad, 3-4 cm. long; petals glabrous, sub-obtuse; lip ovate, obtuse, 2 mm. long; pseudobulbs ovoid, flattened, distinctly 4-angled, 6-7 cm. long, 2-2.5 cm. diam.; leaves oblong, obtuse, 16-22 cm. long, 2-3 cm. broad; scape 18-19 cm. long; dorsal sepal 8 mm. long [60. bibundiense](#)
- Rhachis flattened, 6-8 mm. broad, about 10 cm. long; petals papillose, acute; lip oblong, acuminate, 3 mm. long; pseudobulbs ovoid, 3-angled, 3-5-4 cm. long, 1.5-2 cm. diam.; leaves elliptical-oblong, 7-5-9 cm. long, 1-5-2 cm. broad; scape 27-47 cm. long; dorsal sepal 5 mm. long [61. kamerunense](#)
- 53** Dorsal sepal more or less spathulate or widened above the middle, the sides of the widened part thick and fleshy, apiculate or rounded at the apex, rarely acute: **54**

- Dorsal sepal acute, usually narrowed gradually from the base, not thickened at the sides in the apical part; leaves usually over 1 cm. broad: **61**
- 54** Petals obtuse or rounded and somewhat thickened at the apex which is often yellow, falcate, linear or oblong, 1.7-2.7 mm. long, a little less than half as long as the dorsal sepal; pseudobulbs ovoid or elongate-ovoid, 3-4-angled, 2-6 cm. long; leaves oblong-lanceolate or oblanceolate, 4-16 cm. long, 6-23 mm. broad; scape up to 35 cm. long; rhachis thin, a little sinuate at the margin, up to 14 mm. broad; dorsal sepal 4.5-7 mm. long; wings of column terminating in a rounded lobe below the very short stelia [51. *falcatum*](#)
- Petals not thickened at the apex, either very acute or almost subulate and usually more than half as long as the dorsal sepal, or obtuse or subacute and from a third to a fifth of the length of the dorsal sepal: **55**
- 55** Dorsal sepal 2 1/2-11/2 times as long as the very acute or acuminate petals, not exceeding 6.5 mm. in length; wings of column with a distinct lobe below the stelia; lip ovate or elliptical, not much narrowed in the apical part; leaves ligulate, oblong or elliptical, not more than 10 times as long as broad; ovary and sepals with many short reddish hairs: **56**
- Dorsal sepal 3-5 times as long as the short, obtuse or subacute petals: **58**
- 56** Flowers 1-2.5 mm. apart (both sides of rhachis included); dorsal sepal 2.5-3.5 mm. long; rhachis 1-8 mm. broad; leaves oblong-oblanceolate, obtuse, 1-9 cm. long, 2-13 mm. broad; pseudobulbs narrowly ovoid, 1-3.5 cm. long; scape 2-9 cm. long [50. *melanorrhachis*](#)
- Flowers 2.5-8 mm. apart; dorsal sepal 3.5-6.5 mm. long; scape 5-21 cm. long; pseudobulbs biconvex or obtusely 3-angled: **57**
- 57** Rhachis flattened, 4-15 mm. broad; flowers 2.5-4 mm. apart; pseudobulbs ellipsoid or conical-ovoid, 1.5-4.5 cm. long; leaves ligulate or narrowly oblanceolate, 4-15 cm. long, 5-25 mm. broad; scape 5-13 cm. long [49. *velutinum*](#)
- Rhachis not flattened, very slender, rather flexuous; flowers 3-8 mm. apart; pseudobulbs ovoid or ellipsoid, 1-2.5 cm. long; leaves elliptical-oblong or linear-oblong, 2-8 cm. long, 5-11 mm. broad; scape 9-21 cm. long [48. *simonii*](#)
- 58** Leaves 1-3.7 cm. broad, 6.5-20 cm. long, oblanceolate; wings of column terminating in a distinct rounded lobe below the stelia; pseudobulbs ovoid or conical-ovoid, biconvex, 3-7 cm. long; scape 16-30 cm. long, erect; rhachis variously flattened, sometimes no wider than the peduncle, up to 11 mm. broad; dorsal sepal 6-9 mm. long, usually broadly spatulate; petals lanceolate-oblong, subacute, 1.5-2.2 mm. long [53. *bufo*](#)
- Leaves less than 1.5 cm. broad, usually less than 1 cm., linear or narrowly ligulate; wings of column not terminating in a distinct lobe below the stelia, but gradually merging into the column: **59**
- 59** Rhachis horizontal or recurved below the pseudobulb away from the light, much flattened, 1.5-2 cm. broad, crinkled at the edges; pseudobulbs conical-ovoid, obtusely 4-angled, 2-4 cm. long; leaves narrowly ligulate or linear-ligulate, 20-24 cm. long, 6-9 mm. broad; scape 8-12.5 cm. long; dorsal sepal broadly spatulate, about 6.5 mm. long; petals obliquely narrowly ovate, about 1.5 mm. long [56. *lucifugum*](#)
- Rhachis erect, not at all recurved, variable in width: **60**
- 60** Leaves ligulate or linear-ligulate, 5-19 cm. long, 4-13 mm. broad, from 10-33 times as long as broad; scape 16-65 cm. long; rhachis slender or broadly flattened, up to 15 mm. broad; flowers reflexed after opening; pseudobulbs ovoid, conical or cylindrical-conical, more or less 3-angled, 1-6 cm. long; dorsal sepal broadly spatulate, 5.5-8.3 mm. long, often somewhat recurved; petals oblong, 1-2 mm. long [55. *calyptarum*](#)
- Leaves linear, grass-like, 9-32 cm. long, 3-10 mm. broad, from 26-80 times as long as broad; scape 10-28 cm. long; rhachis slender or only very slightly flattened; flowers not reflexed after opening, usually somewhat incurved; pseudobulbs conical-cylindrical to conical-ovoid, 3-4-angled, 1-5 cm. long; dorsal sepal 6-7.5 mm. long, more or less incurved; petals oblong or lanceolate-oblong, 1.7-2.6 mm. long [54. *graminifolium*](#)
- 61** Scape over 8 cm. long, usually much longer; rhachis slender or flattened: **62**
- Scape less than 8 cm. long, often much shorter; rhachis always slender, with the flowers closely placed; dorsal sepal less than 5 mm. long, lanceolate; petals narrow and acute; leaves up to 1 cm. broad: **65**
- 62** Flowers densely hairy; rhachis up to 4.5 cm. broad, often twisted spirally, heavily blotched purple; leaves oblanceolate, 13-25 cm. long, 3-5 cm. broad, purple speckled beneath; peduncle with several short loose sheaths; pseudobulbs oblong, flattened, 5-8 cm. long; petals narrowly lanceolate, acuminate [52. *purpureorhachis*](#)
- Flowers glabrous or sparsely puberulous: **63**
- 63** Petals falcate-oblanceolate, wider in the upper part, 0.9-1.5 mm. broad; leaves oblanceolate, 10-24 cm. long, 3-5.5 cm. broad; pseudobulbs elongate ellipsoid, 3-5-angled, 4-10 cm. long; scape 16-25 cm. long, rhachis flattened, 7-20 mm. broad, sinuate at the edge; dorsal sepal lanceolate, acute, sides inrolled, 6-8 mm. long [45. *fuerstenbergianum*](#)
- Petals falcate linear or very narrowly lanceolate, not broader in the upper part, less than 0.8 mm. broad; leaves ligulate, or oblong-elliptical, 8-35 mm. broad: **64**
- 64** Dorsal sepal triangular-lanceolate, 3-3.5 mm. long; scape 35-55 cm. long, rhachis very slender; petals curved oblong, 2 mm. long; pseudobulbs elongate ovoid, angular, 2.5-4 cm. long; leaves oblong-elliptical, 6-7 cm. long, 10-16 mm. broad; wings of column terminating below stelia in a broad short rounded lobe; lateral

sepals apiculate [43. filiforme](#)

Dorsal sepal narrowly lanceolate, acute, 5.5-8 mm. long; scape 8-66 cm. long, rhachis more or less flattened, up to 10 mm. broad; petals linear, much curved, 3-5 mm. long; pseudobulbs elongate ovoid or conical, 3-5-angled, 2-7.5 cm. long; leaves ligulate or oblong, 6.5-16 cm. long, 8-35 mm. broad; wings of column terminating below steldia in a narrow subacute or obtuse lobe; lateral sepals acuminate [44. congolanum](#)

- 65** Plant very small; pseudobulbs less than 1 cm. long; leaves 6-9 mm. long, 3-4 mm. broad; scape less than 2 cm. high, few-flowered; dorsal sepal about 3-5 mm. long; petals 2-3 mm. long, falcate-linear, very acute; lip curved, ovate, 1-5 mm. long; wings of column terminating in narrow rounded-triangular lobes [42. parvum](#)

Plant larger, pseudobulbs 1-3.5 cm. long, biconvex; leaves 1-6 cm. long, 3-10 mm. broad; scape 3-8 cm. long; petals falcate-ligulate, acute; wings of column terminating in broad rounded lobes: **66**

- 66** Flowers 1.5-2 mm. apart, bronze-yellow to purple, the bracts equalling or longer than the internodes; lip ovate, not narrowed much in front; pseudobulbs up to 3.5 cm. long; leaves 1.5-6 cm. long; scape 4-8 cm. long, many-flowered; dorsal sepal 2.5-5 mm. long; petals 1.5-3 mm. long [41. rhizophorae](#)

Flowers 2-3.5 mm. apart, yellow, the bracts distinctly shorter than the internodes; lip distinctly narrowed in front from an ovate base; pseudobulbs 1-2.5 cm. long; leaves 1-4.5 cm. long; scape 3-6 cm. long, few-flowered; dorsal sepal 4-5 mm. long; petals 2.5-3.5 mm. long [40. falcipetalum](#)

1. *Bulbophyllum flavidum* Lindl. in Bot. Reg. 26: Misc. 83 (1840); F.T.A. 7: 30.

APD: *Synonym of Bulbophyllum pumilum* (Sw.) Lindl.

(?) *B. herminiostachys* (Rchb. f.) Rchb. f. (1861)-F.T.A. 7: 35.

Bulbophyllum moliwense Schltr. in Engl., Bot. Jahrb. 38: 157(1906).

Flowers yellow or yellowish-green, marked or tinged with red or pink, or rarely deep purple.

Guin.: Macenta (July) Jac.-Fél. 1044! **S. L.**: Musaia (July, Aug.) Deighton 4327a! Koidu, Kisi Kama (Aug.) Deighton 5913! Bumpe Peri (July) Deighton 4836! Fanima, Soro (July) Deighton 4640! 4653! Kasasa, Tonko Limba (Sept.) Adames 194! **Lib.**: Yoma, Montserrado Dist. (Aug.) Leeuwenberg 4830! **Iv. C.**: Lecoufle K509! **Ghana**: Amedzofe (June, July) Scholes 86! Morton A3413! **S. Po.**: lava flow (Sept.) Wrigley 543!

Also in **Gabon** and **S. Tomé**.

2. *Bulbophyllum schimperanum* Kraenzl. in Engl., Bot. Jahrb. 33: 71 (1602). *APD acc*

Bulbophyllum xanthoglossum Schltr. in Engl., Bot. Jahrb. 38: 158 (1906).

Flowers white.

S. Nig.: Ajagbodudu, Warri Prov. (Sept.) Wright 135! 161! **W. Cam.**: Victoria (Sept.) Schimper 341! Moliwe (Aug.) Schlechter 15755! Buea (Mar.) Deistel 54.

Also in **Congo** and **Uganda**.

3. *Bulbophyllum cocoinum* Batem. ex Lindl. in Bot. Reg. 23: t. 1964 (1837); F.T.A. 7: 31. *APD acc*

Bulbophyllum viliense Rolfe in Kew Bull. 1893: 5.

Flowers white, cream-coloured or greenish, tinged pink or with pink apices.

S. L.: cult. spec.! **Lib.**: (July) Harley 2046! Mt. Barclay (June) Bunting 10! **Ghana**: Ofinsu (May) Vigne FH 4864! Bunsu (May) D. Gillett! Efiduase (May) Cox 25! Boanim to Mampong (Apr.) Westwood 134! Mampong to Nsula Westwood 103!

Also in **Annobon** and (?) **Uganda**.

4. *Bulbophyllum josephii* (Kuntze) Summerh. in Bot. Mus. Leaf. Harv. Univ. 11: 250 (1945). *APD acc*

Phyllorchis josephii Kuntze, Rev. Gen. Pl. 676 (1891).

Bulbophyllum aurantiacum Hook. f. (1864)-F.T.A. 7: 30, not of F. Muell.

Bulbophyllum gustavii Schltr. in Fedde Rep. 9: 165 (1911), in obs.; F.W.T.A., ed. 1, 2: 439.

Flowers orange or orange-red and whitish green.

Guin.: Nimba Mts., 5,300 ft. (Oct.) Schnell 3845! **S. L.**: Loma Mts., Jaeger 1191! **Iv. C.**: Mt. Tonkoui (Oct.) Aké Assi 5667! **S. Nig.**: Obudu Plateau Horwood 165! 5. *Bulbophyllum modicum* Summerh. in Kew Bull. 11: 114 (1957).

APD: *Synonym of Bulbophyllum josephii* var. *mahonii* (Rolfe) J. J. Verm.

Flowers magenta and white, column green.

W. Cam.: Buea, 3,000ft. (Oct.) Gregory 193! 558! Keay FHI 25439!

6. *Bulbophyllum calvum* Summerh. in Kew Bull. 20: 185, fig. 8 (1966). APD acc

Sepals pale yellow-green, lip red with yellow base and white flecks above.

N. Nig.: Maisamari, Mambila Plateau, 6,000 ft. (Oct.) Nash & Wimbush in Hb. King 178!

7. *Bulbophyllum nigratianum* Rendle Cat. Talb. 99 (1913). APD acc

Flowers white or pale yellow, sometimes tinged green.

S. L.: Gegbwema (Dec.) Deighton 2823! Kebawana, Gaura (Nov.) Deighton 4649! 4946! Lib.: Suen (Nov.) Linder 1393! Tawara, Boporo Dist. (Nov.) Baldwin 10307! Iv. C.: Tiapleu (Oct.) Aké Assi 9124! Ghana: Awaso Blayney 2! S. Nig.: Oban Talbot 933!

Also in Congo.

8. *Bulbophyllum pipio* Rchb. f. in Linnaea 41: 92 (1877); F.T.A. 7: 32. APD acc

Bulbophyllum milesii Summerh. in Kew Bull. 1935: 200; F.W.T.A., ed. 1, 2: 439.

Flowers cream or yellow, purplish in centre.

S. L.: York I. (Nov.) Adames 106! Victoria Creek (Oct.) Adames 99! Yagoi, Jong R. (Oct., Nov.) Adames 100! Ghana: Sekondi (Apr.) Cox 129! Western Prov. (Nov., Dec.) Miles 19!

Also in E. Cameroun.

9. *Bulbophyllum buntingii* Rendle Cat. Talb. 99 (1913).

APD: *Synonym of Bulbophyllum ivorense* P.J. Cribb & Perez-Vera

APD: *Synonym of Bulbophyllum oxychilum* Schltr. var. *oxychilum*

Pseudobulbs often reddish; flowers white, cream-coloured or very pale pink.

Guin.: Sérédou Pujol L363! Lib.: Begwai (Oct.) Bunting 291! Tawata, Boporo Dist. (Nov.) Baldwin 10300! Ganta (Oct.) Harley 1759! Kitoma (Oct.) Harley 1833! Yah R., Sanokwele Dist. (Oct.) Adames 664! Also in **Gabon** and **Congo**.

65. Bulbophyllum linderi *Summerh.* in Kew Bull. 1935: 202.

APD: Synonym of Bulbophyllum imbricatum var. purpureum W. Sanford

Rhachis and flowers cream coloured or whitish.

S. L.: Mesima, Pukumu Krim (Nov.) Deighton 4921! **Lib.:** Bumbuma (Oct., Nov.) Linder 1325! Harley 1947! Nimba (Jan.-Oct.) Adam 20685! Adames 685! **iv. C.:** Tiapleu (Oct.) Aké Assi 9129!

29. GENYORCHIS

Schltr. in Engl., Bot. Jahrb. 38: 11 (1905).

- 1** Pseudobulb 2-leaved, scarcely flattened:.....**2**
Pseudobulbs 1-leaved, somewhat flattened, 1-1.7 cm. long, 5-10 mm. broad; leaves oblong-elliptical, 1.5-4.5 cm. long, 4-9 mm. broad; scape slender, 10-14 cm. long, 5-17-flowered in the upper half; mentum helmet-shaped, 2.5-3 mm. long; lip about 3 mm. long, front lobe recurved, tooth-like[5. platybulbon](#)
 - 2** Lateral lobes of the lip as long as, or longer, than the remainder of the lip below the recurved middle lobe; mentum of flower very short and rounded, the margins of the lateral sepals equal; pseudobulbs up to 12 mm. long; leaves 1-3 cm. long, 2-3 mm. broad; scape 2-4 cm. long, very slender; rhachis zigzag, up to 10-flowered[1. micropetala](#)
- Lateral lobes of the lip much shorter than the remainder of the lip below the recurved middle-lobe; mentum of

flower helmet-shaped or conical, the upper margin of the lateral sepals much longer than the lower:3

- 3 Middle lobe of lip small, tooth-like; stelidia lanceolate, acute, much overtopping the androclinium, scarcely angled on each side of the stigmatic cavity:4

Middle lobe of lip large, almost orbicular, entirely adnate to the lower surface; stelidia scarcely overtopping the androclinium, forming triangular projections on each side of the stigmatic cavity; mentum 3 mm. long, upper margins of lateral sepals over 6.5 mm. long; lip curved, 4.5-5 mm. long, side lobes very short; pseudobulbs 1-2 cm. long; leaves 1-3 cm. long, 3-7 mm. broad; scape to 6.5 cm. long, up to 7-flowered4. *macrantha*

- 4 Dorsal sepal over 4 mm. long, lateral sepals somewhat spreading so that flower appears open, upper margins over 5.5 mm. long; apex of lip middle lobe incurved, quite free from the lower surface; wings of column somewhat curved backwards; pseudobulbs 10-12 mm. long; leaves broadly or elliptical-oblong, 1-2 cm. long, 5-7 mm. broad; scape very slender, 8 cm. long, 5-flowered in the upper 1 cm.2. *apertiflora*

Dorsal sepal 2.5-3 mm. long; lateral sepals more or less parallel in position, upper margins 3.5-4.5 mm. long; apex of lip middle lobe not incurved, whole of lobe adnate to the lower surface; wings of column straight; pseudobulbs 6-15 mm. long; leaves ligulate or oblong, 7-20 mm. long, 2-5 mm. broad; scape up to 17 cm. long, up to 12-flowered in the upper third or quarter3. *pumila*

1. *Genyorchis micropetala* (Lindl.) Schltr. in Engl., Bot. Jahrb. 38: 11 (1905). *APD acc*

Bulbophyllum micropetalum Lindl. in J. Linn. Soc. 6: 127 (1861).

Polystachya micropetala (Lindl.) Rolfe in F.T.A. 7: 131 (1897).

F. Po: 4,000 ft. (Dec.) Mann 644! Pico Boca, 5,400 ft. Sanford 4267!

Also in (?) Congo.

2. *Genyorchis apertiflora* Summerh. in Kew Bull. 11: 123 (1967). *APD acc*

Sepals white. lip pale yellow.

S. Nig.: Mt. Orosun, Idanre Hills, Ondo (Nov.) Keay FHI 25545!

3. *Genyorchis pumila* (Sw.) Schltr. in Engl., Bot. Jahrb. 38: 12 (1905).

APD: *Synonym of Genyorchis apetala* (Lindl.) J. J. Verm.

APD: *Synonym of Bulbophyllum pumilum* (Sw.) Lindl.

Dendrobium pumilum Sw. (1805).

Polystachya bulbophylloides Rolfe (1891)-F.T.A. 7: 131.

Flowers white or greenish white.

S. L.: Afzelius! Bagroo R. Mann! Benkia, Port Loko Creek (Mar.) Glanville in Hb. Deighton 1816! Maswari, Peninsula (Mar.) Adames 203! Yagoi, Jong R. (Nov.) Adames 101! **iv. C.:** Abouabou (Dec.) 30. EULOPHIDIUM

APD: *Synonym of Oeceoclades* Lindl.

Pfitz., Entw. Nat. Anord. Orch. 87 (1887).

- 1 Labellum without any calli at the base, 7 mm. long, 4-6 mm. broad, broadly 3-lobed, the middle lobe clearly emarginate; leaves 2-3 to the pseudobulb, lamina 5-13 cm. long, 1.5-4.5 cm. broad, rounded at base; pseudobulbs long and slender, up to 13 cm. long, usually less than 5 mm. diam.; inflorescence slender, shorter than the leaves, nearly always branched; sepals and petals ligulate, a little broader above, 7-9 mm. long, the petals a little shorter than the sepals; spur slightly swollen, 3-4 mm. long [1. latifolium](#)
- Labellum with 2 calli close together at the base, as broad as long or a little broader than long, almost equally 4-lobed, the two parts of the middle lobe separated by a deep cleft; leaves 1-2 (rarely 3) to the pseudobulb, lamina almost always over 9 cm. long and often much longer; inflorescence usually longer than the leaves: ... **2**
- 2 Leaves always 1 to a pseudobulb, lamina narrowly lanceolate, thick and leathery, tapering gradually into a broad folded petiole, pale green with irregular transverse bands of darker spots, 8-32 cm. long, 2-5.5 cm. broad, petiole much shorter than the lamina; pseudobulbs narrowly conical or cylindrical, up to 4 cm. long and 1.5 cm. diam.; tepals about 1 cm. long, the petals a little broader than the sepals; spur 4-4.5 mm. long [2. maculatum](#)
- Leaves 1-3 to a pseudobulb, lamina broadly lanceolate, leathery but not very thick, dark green in colour, 10-22 cm. long, 4-8 cm. broad, narrowing rather abruptly into an almost terete channelled petiole which is nearly as long as the lamina; pseudobulbs narrowly conical to narrowly cylindrical, up to 20 cm. long and 1.5 cm. diam.; tepals about 1 cm. long, the petals distinctly shorter and broader than the sepals; spur 5 mm. long [3. saundersianum](#)

1. *Eulophidium latifolium* (Rolfe) Summerh. in Bull. Jard. Bot. Brux. 27: 396 (1957).

*APD: Synonym of *Oeceoclades ugandae* (Rolfe) Garay & P. Taylor*

Eulophia latifolia Rolfe (1891, pub. 1892)-F.T.A. 7: 50.

Eulophidium ugandae Rolfe in Kew Bull. 1913: 339.

Flowers white, with faint reddish or purplish markings.

Ghana: Breniesi, E. Krachi, Ashanti (fr. Dec.) Westwood 147!

Also in **S. Tomé**, **Congo** and **Uganda**.

2. *Eulophidium maculatum* (Lindl.) Pfitz. Entw. Natur. Anordn. Orch. 88 (1887).

*APD: Synonym of *Oeceoclades maculata* (Lindl.) Lindl. var. *maculata**

*APD: Synonym of *Oeceoclades maculata* (Lindl.) Lindl.*

Angraecum maculatum Lindl., Collect. Bot. t. 15 (1821).

Eulophia ledienii Stein ex N. E. Br. (1889-90)-F.T.A. 7: 50.

Eulophidium ledienii (Stein ex N.E. Br.) De Wild. in Ann. Mus. Congo, sér. 5, 1: 115 (1904); F.W.T.A., ed. 1, 2: 440.

Eulophidium warnekeanum Kraenzl. in Engl., Bot. Jahrb. 33: 70 (1902).

Flowers greenish white with pink blotches on the lip.

Sen.: Boukitingo Forest, Oussouye (Nov.) Berhaut 6527! **Port. G.:** Bissau, Cumura (fr. Nov.) Esp. Santo 2226! **S. L.:** Njala (Aug.) Deighton 2208! R. Seli, Kombile (Oct.) Small 818! Banana Is. 31. EULOPHIA

R.Br. ex Lindl., Bot. Reg. t. 686 (1823); F.T.A. 7: 47, 70. Nom. cons.

Lissochilus *R. Br.* (1821)-F.T.A. 7: 70.

- 1 Spur 1.5-3 cm. long, very slender; sepals and petals similar, green or brownish, lanceolate acute, spreading and somewhat reflexed, 2-3 cm. long; lip 3-lobed, 2-4 cm. long, without calli, pink, side lobes small, middle lobe much larger, ovate to suborbicular, acute to retuse; scape 40-90 cm. high; leaves up to 45 cm. long, 4-13 cm. broad:2
- Spur up to 1.5 cm. long, usually less than 1 cm., if over 1 cm. then very wide in lower part:3
- 2 Leaves fully developed at time of flowering; lip ovate, elliptical or obovate, more or less acute at apex; usually in forest or woodlands [1. guineensis](#)
- Leaves developing after the inflorescence; lip broadly obovate or almost orbicular, broadly rounded or slightly emarginate at apex; usually in savanna [2. quartiniana](#)
- 3 Lip truncate, shorter than the spur, the front margin longly ciliate, callus tooth-like near margin in centre; leaves opening with flowers, lanceolate, 1-5 cm. broad; scape 40-95 cm. high, laxly many-flowered; sepals lanceolate, acute, 10-12 mm. long; petals similar but smaller; spur clavate at the apex, widened at the base, 8 mm. long; rarely epiphytic [3. gracilis](#)
- Lip not truncate, usually considerably longer than the spur, margin sometimes slightly toothed but never ciliate: 4
- 4 Bracts tapering from the base or just above, usually linear-lanceolate and long-acuminate, or if broader less than 1 cm. long:5
- Bracts broad from a much narrower base, apiculate to acuminate in the upper part, over 1 cm. long and 7-30 mm. broad; scapes 1-2 m. high; leaves at least 3 cm. broad: 32
- 5 Sepals more or less connivent or somewhat spreading, not reflexed, in most species very similar to the petals in shape and colour (see species 12, 15, 16, 17 & 18 where petals are broader):6
- Sepals sharply reflexed, in most species markedly different from the petals in shape and colour: 24
- 6 A leafless pale yellow saprophyte; underground stem rather thin, fleshy, with numerous obtuse scale-leaves and semiglobose whitish tubercles (? arrested roots); scape 10-25 cm. high, up to 5-flowered; sepals and petals oblanceolate, 1.5-2.5 cm. long; lip 3-lobed, 1.5-2 cm. long, side lobes very small, rounded, middle lobe much larger, emarginate, lip covered in the front part with small purplish papillae [19. galeoloides](#)
- Plants with leaves, which may expand after the flowers; stems fleshy tubers or pseudobulbs:7
- 7 Sepals 4-12 mm. long; leaves in most species not expanding until after flowering:8
- Sepals 13-35 mm. long; bracts narrowly lanceolate or linear, acuminate: 18
- 8 Inflorescence branched; scape 40-70 cm. high; no leaves at time of flowering; mature leaves 5-6, linear, spreading; bracts very short; sepals narrow, acute, about 7 mm. long; petals similar, a little shorter; lip 3-lobed, 6-7 mm. long, side lobes obtuse, middle lobe orbicular, disk with 5 slightly rough keels; spur 2-3 mm. long [14. ramifera](#)
- Inflorescence not branched, but sometimes 2 inflorescences arise from the same stem (rarely a single branch in No. 13):9
- 9 Leaves 4-6 on the stem, narrowly linear, up to 20 cm. long but less than 4 mm. broad, usually well-developed at time of flowering; stems swollen at base to form narrowly conical aerial pseudobulbs; inflorescences often paired, up to 25 cm. long, rather lax; flowers spreading, becoming pendulous in fruit; sepals ligulate, 8-11 mm. long, petals a little shorter and broader; lip 3-lobed in upper part, middle lobe elliptical, veins with several rows of quadrate calli or bearing interrupted keels [9. lindiana](#)
- Leaves 1 on the flowering shoot, or 2-4 on a separate sterile shoot, or absent at time of flowering; stems in form of underground tubers: 10
- 10 Calli of lip consisting of verrucose keels which may be more or less confluent, not of hairs: 11
- Calli of lip consisting mainly of hair-like outgrowths: 14

- 11 Petals distinctly shorter than the sepals but much broader, 4.5-6 mm. long; leaves partly developed at time of flowering, 2-4 on distinct sterile shoots, broadly lanceolate or elliptical, when mature up to 30 cm. long and 7 cm. broad; scape 30-50 cm. tall, many-flowered in upper part; sepals 6-8 mm. long; lip 3-lobed, side lobes short, adnate to column, middle lobe much longer, keels of callus confluent into a single mass, spur 4-5 mm. long [17. leonensis](#)
- Petals equalling or longer than the sepals; no leaves at time of flowering; scape 30-40 cm. long, many-flowered: 12
- 12 Spur narrow and elongated from a broad base, total length, from apex of ovary, 6-8.5 mm.; sepals 6.5-8 mm. long, ligulate; lip distinctly 3-lobed, side lobes erect, semi-elliptical, middle lobe elliptical, 4-6.5 mm. long with 5-7 verrucose keels; petals much broader than sepals and usually a little longer, broadly elliptical or almost orbicular [18. stenoplectra](#)
- Spur very short, less than 2 mm. long; sepals less than 6.5 mm. long: 13
- 13 Lip side lobes very small, triangular, not much diverging from the much larger orbicular front lobe; keels of lip rather indistinct, the thickenings transversely arranged; sepals 4.5-6.5 mm. long, oblong-lanceolate, apiculate; petals broader than sepals and about the same length, elliptical; leaves on separate shoots, linear acute [15. sordida](#)
- Lip side lobes basal, spreading, broadly triangular; keels of lip prominent with a group of irregular taller calli just in front of the spur opening; sepals 3.5-6.5 mm. long, oblong, acute; petals broader than sepals, the same length or longer, elliptical to nearly orbicular; leaves on separate shoots, linear-lanceolate, fleshy .. [16. parvula](#)
- 14 Petals about half to two-thirds as long as the sepals, narrowly elliptical; sepals narrowly oblanceolate, subacute, 7.5-14 mm. long; lip 3-lobed, side lobes very small, more or less incurved, middle lobe elliptical or almost orbicular, much larger; spur swollen at the end, about 3-4 mm. long, incurved; scape 30-60 cm. tall; raceme lax, 6-15-flowered, bracts very small [13. brevipedata](#)
- Petals about the same length as the sepals: 15
- 15 Raceme short (3-7 cm. long), dense; peduncle completely encased in overlapping chaffy brown sheaths; bracts similar, longer than the pedicels; scape 40-80 cm. tall; sepals and petals very similar, ovate or lanceolate, 9-12 mm. long; lip 3-lobed, side lobes triangular, middle lobe oblong, disk with 2 thickened keels below the hairy veins; leaves 1 or 2 on a separate sterile shoot, narrowly oblanceolate, 30-90 cm. long, 7-19 mm. broad [8. shupangae](#)
- Raceme relatively long, lax; sheaths of peduncle not overlapping; sepals narrow or oblong-lanceolate: 16
- 16 Sepals linear-ligulate, acute, 10-12 mm. long; petals ligulate, a little shorter and broader; lip side lobes obtusely triangular, middle lobe obovate, lip about 9 mm. long; raceme 15 cm. long [12. monile](#)
- Sepals oblong or oblong-lanceolate, 4-7 mm. long; petals similar but a little shorter; lip 3-lobed, middle lobe rectangular or slightly wider in front, emarginate, margins irregular, veins bearing numerous hair-like outgrowths; scape 15-40 cm. tall, raceme to 10 cm.; leaf single or rarely 2, almost thread-like or very narrowly linear, up to 33 cm. long: 17
- 17 Side lobes of lip not diverging from middle lobe; disk with thickened callus or calli; spur 2-4.5 mm. long, rather slender [11. warneckeana](#)
- Side lobes of lip divergent; disk without thickened calli but 3 central veins only slightly thickened; spur about 1.5-2 mm. long, slightly widened at the apex [10. milnei](#)
- 18 Spur represented by a broad rounded sac; lip bearing 2 quadrate calli in the centre and hairs on the veins of the broadly ovate or semiorbicular middle lobe; petals a little shorter and broader than the sepals; leaves lanceolate, 3-10 cm. broad, appearing with the flowers; scape 40-120 cm. high, many-flowered, bracts very narrow [20. alta](#)
- Spur acute or, if obtuse, much narrowed: 19
- 19 Leaves more or less well-developed at time of flowering, 1.5-6 cm. broad; lip 12-25 mm. long; sepals rather longer: 20
- Leaves scarcely developed at time of flowering, apparently much less than 1 cm. broad; plants with irregular tubers: 22
- 20 Leafy stems thickened at base to form tall cylindrical somewhat tapering green pseudobulbs; lip elliptical in general outline, side lobes small, triangular, middle lobe ovate, crenulate, central nerves thickened to form 2-3 low keels; spur 6-8 mm. long, wider at apex; scapes 40-200 cm. high; raceme 20-40 cm. long; sepals and petals similar in shape and colour [4. euglossa](#)
- Leafy stems thickened only at the very base, not forming pseudobulbs; scapes 30-70 cm. high: 21
- 21 Sepals and petals differently coloured, 1.5-2 cm. long, the petals broader than the sepals; lip nearly as broad as long, disk and front lobe with 3-5 verrucose keels sometimes bearing hair-like outgrowths; raceme rather lax, 10-20 cm. long; spur 3-4 mm. long, tapering towards apex [5. stachyodes](#)
- Sepals and petals the same colour, 2-3.5 cm. long, the petals narrower than the sepals; lip longer than broad, disk with 2 low keels, front lobe bearing numerous slender hairs; raceme very dense, usually less than 10 cm. long; spur 2-4 mm. long, more or less incurved, slender not tapering [6. zeyheri](#)

- 22 Petals about half to two-thirds as long as the sepals; sepals narrowly oblanceolate, subacute, 7.5-14 mm. long; spur swollen at end, 3-4 mm. long; lip 3-lobed, side lobes much smaller than the elliptical or almost orbicular middle lobe; scape 30-60 cm. tall; raceme lax, 6-15-flowered [13. brevipedata](#)
- Petals nearly as long as the sepals; sepals lanceolate, acute; spur tapering towards the apex:..... **23**
- 23 Flowers green with brownish, purple or crimson markings on lip; petals oblong, narrower or not broader than the sepals, 13-20 mm. long; lip 10-20 mm. long, disk with 2 low keels, veins of front lobe bearing short hairs or much-interrupted keels; scape 28-80 cm. [7. adenoglossa](#)
- Flowers pale yellow or cream-coloured with sometimes the veins of the lip purplish; petals oblong-elliptical, broader than the sepals; sepals 17-29 mm. long; lip 20-27 mm. long, the orbicular crenulate middle lobe with 5-9 low verrucose keels; scape 30-100 cm. [22. flavopurpurea](#)
- 24 Sepals more or less spathulate, widest near the rounded apex, 1.3-2.5 cm. long; petals elliptical or oblong-elliptical, about as long as the sepals and at least 2-3 times as wide; scapes 0.5-1.5 m. high; lip indistinctly 3-lobed, side lobes broad, rounded: **25**
- Sepals not wider at the apex than below, obtuse or acuminate: **26**
- 25 Petals white to red; leaves very narrow, 5-15 mm. broad; central veins of lip bearing numerous short hair-like outgrowths and 3 low keels towards the base [24. caricifolia](#)
- Petals yellow; leaves broader, 12-45 mm. broad; lip with 3 semicircular or lamellae-like keels in the centre and 3 lower ones at the base [25. angolensis](#)
- 26 Flowers yellow, petals with reddish veins or entirely red beneath; sepals 6-11 mm. long, rarely to 14 mm., obovate-elliptical, shortly acuminate; petals ovate-orbicular, 11-20 mm. long and almost as broad; lip 3-lobed, middle lobe ovate more or less convex, side-lobes erect, adnate to the foot and also the base of the column: **27**
- Flowers various shades of pink or mauve; sepals 12-33 mm. long; **28**
- 27 Leaves more or less developed at time of flowering, long and round, almost terete in section, rush-like, less than 5 mm. diam.; spur upcurved, total length to apex of ovary 3-7.5 mm.; sides and apex of lip middle-lobe more or less incurved and somewhat undulate, keels 5, rather low; sepals 6.5-9 mm. long; petals 11-14.5 mm. long [33. juncifolia](#)
- Leaves developed after flowering, strap-shaped or lanceolate, 1-3 cm. broad; spur almost straight, often with long cylindrical apex, total length to apex of ovary 11-19 mm.; lip with 3 tall keels and 1 or 2 additional lower ones on each side; sepals 7.5-14 mm. long; petals 12.5-20 mm. long [34. orthoplectra](#)
- 28 Sepals and petals similar, more or less oblong, the latter a little broader; lip relatively narrow, 1.3-2.2 cm. long, trilobed, the middle lobe elliptical or elliptical-ovate, disk with 2 semicircular entire keels towards the base and 5-7 much-broken-up keels in front; spur narrowed into an acute somewhat up-turned apex; raceme 20-45 cm. long, 13-40-flowered; leaves narrowly lanceolate, 2-6 cm. broad, appearing after the flowers [23. cristata](#)
- Sepals and petals very dissimilar, the latter much wider, broadly elliptical or almost orbicular; lip broad, trilobed, the middle lobe more or less bilobed or retuse: **29**
- 29 Spur relatively narrow, conical; lip less than 2 cm. long, middle lobe with several low rugulose keels but no erect calli [21. calantha](#)
- Spur very broad and rounded, scarcely distinct from rest of lip; lip 2-3.5 cm. long, ecallose or with 2 erect calli at the base of the middle lobe and a few lower ones in front: **30**
- 30 Lip with no calli, front lobe with a distinct narrow claw; sepals more or less oblong, obtuse; petals retuse at apex; leaves appearing after the flowers [28. buettneri](#)
- Lip with 2 erect narrow quadrate calli in the centre and the veins just in front variously keeled and/or with small horn-like outgrowths, front lobe not much narrowed at base; petals rounded or minutely apiculate at apex: . **31**
- 31 Leaves appearing after the flowers, linear, up to 1.5 cm. broad [26. cucullata](#)
- Leaves appearing with the flowers, lanceolate, 2.5-6 cm. broad [27. dilecta](#)
- 32 Petals much longer and broader than the narrow sepals, 2.5-3 cm. long, suborbicular; sepals narrowly spathulate-oblong, 1.5-2 cm. long, 5-7 mm. broad; bracts obovate, apiculate; spur more or less inflated underneath in the lower part, suddenly narrowed near the apex; lip about 3 cm. long, 3-lobed, side lobes rounded, middle lobe ovate, obtuse, disk with 3 rather short keels in the centre [31. oedoplectron](#)
- Petals not much longer than or equalling the sepals in length, but broader; bracts broadly lanceolate or ovate, acuminate or apiculate:..... **33**
- 33 Lip indistinctly 3-lobed, 2.5-4 cm. long and broad, front lobe much broader than long, disk with 3-5 keels; sepals obovate, obtuse, 2.5-3 cm. long, 1-2 cm. broad; spur conical with a narrow upcurved apex; bracts 2-5 cm. long, 1.5-2.5 cm. broad; petals not much spreading, orbicular or broader than long [32. latilabris](#)
- Lip distinctly 3-lobed, front lobe longer than broad or length and breadth about equal, disk with 3 keels, semicircular at the base and running out into crenulate lamellae in front; petals broadly elliptical or almost orbicular, usually longer than broad: **34**
- 34 Sepals oblanceolate or obovate, apiculate or shortly acuminate, much narrowed in the lower part, 1.7-2.7 cm. long; lip 2-4 cm. long, 1.6-4 cm. broad across the side lobes [29. horsfallii](#)

Sepals oblong-ob lanceolate, obtuse, not much narrowed in the lower part, 1.3-1.7 cm. long; lip 1.6-2.5 cm. long, 1.5-2.5 cm. broad across the side lobes [30. barteri](#)

1. ***Eulophia guineensis* Lindl.** in Bot. Reg. 8: t. 686 (1823); F.T.A. 7: 69, partly; F.W.T.A., ed. 1, 2: 444, partly (excl. syn. *E. quartiniana* A. Rich.). *APD acc*

A terrestrial herb 1-3 ft. high with several leaves arising from the base and spike of pink and greenish flowers; **in forest**.

Also in **Gabon**, **Congo** and **Uganda**.

5. *Eulophia stachyodes* *Rchb. f.* Otia Bot. Hamburg. 66 (1878); F.T.A. 7: 58. *APD acc*

Eulophia lambii *Rolfe* in Kew Bull. 1914: 212.

Herb to 21/2 ft. high with broad leaves and a rather close spike of brown and white flowers.

N. Nig.: Vom (June) Dent Young! Lamb! Kassa, Plateau Prov. (June) King 119! **W. Cam.:** Nchan, Bamenda, 5,000 ft. (June) Maitland 1783! Basenako, Bamenda, 5,000 ft. (June) Maitland 1507!

Also in **E. Cameroun**, **Congo**, **Sudan**, **Ethiopia**, **Uganda** and **Kenya**.

6. *Eulophia zeyheri* *Hook f.* in Bot. Mag. 119: t. 7330 (1893).

APD: Synonym of Eulophia welwitschii (Rchb. f.) Rolfe

Eulophia milanjiana *Rendle* (1895)-F.T.A. 7: 63.

A herb up to 21/2 ft. high with broad leaves and a short dense spike of yellow flowers which often have a deep orange, brown or plum-coloured centre.

N. Nig.: Vom, Plateau Prov., 4,200 ft. (May) King 155!

Also in **Congo** and eastern Africa from **Sudan** southwards to the Eastern Cape Province.

7. *Eulophia adenoglossa* (*Lindl.*) *Rchb. f.* Otia Bot. Hamburg. 66 (1878); F.T.A. 7: 59. *APD acc*

A herb up to 21/2 ft. high with very narrow leaves developing after the flowers, the flowers green and brown.

N. Nig.: Nupe Barter! Kontagora (June) Dalz. 562! Keana, Nassarawa Prov. (May) Hepburn 23! Randa (June) Hepburn 61! Source of Jarawa R., Bauchi Prov. King 109a! Mando F.R., Zaria Prov. (June) Keay FHI 25815!

Also in **Kenya**.

8. *Eulophia shupangae* (*Rchb. f.*) *Kraenzl.* in Engl., Pflanzenw. Ost-Afr. C: 157 (1895); F.T.A. 7: 66.

APD: Synonym of Eulophia odontoglossa Rchb. f.

Eulophia propinqua *Hutch.* in Kew Bull. 1921: 410; F.W.T.A., ed. 1, 2: 446.

Eulophia baoulensis *A. Chev.*, Bot. 613, name only.

Flowers in a dense head, white, yellow with brown or purple markings, or entirely brownish or purplish.

Guin.: Massif de Fon (Aug.) Schnell 3320! 3321! Nimba Mts. (Aug.) Schnell 3382! **S. L.:** Kortright (Sept.) Gledhill 50! Sugar Loaf Mt. (Aug.) Melville & Hooker 57! Kasokora (Aug.) Deighton 1234! 36. ANGRAECUM

Bory, Voy. 1: 359 (1804); F.T.A. 7: 133, partly. APD acc

- 1 Leaves with sharp points, not closely imbricate at the base; pollinia attached directly to the broad viscidium, stipes absent: **2**
- Leaves without sharp points, though sometimes acute: **3**
- 2 Leaves subulate-terete, more or less falcate, 3-13 cm. long, 1-2.5 mm. diam.; sepals about 4 mm. long; lip boat-shaped, very broad when flattened out, pointed in front, spur 5 mm. long [5. subulatum](#)
- Leaves oblong-lanceolate, flattened, fleshy, 2-4 cm. long, 3-6 mm. broad; sepals 6-7 mm. long; lip much broader than long, spur 4.5 mm. long [4. pungens](#)
- 3 Flowers solitary on short (6 mm. long or less) peduncles; sepals 7 mm. long or less; leaves less than 3 cm. long, closely imbricate at base, lying in the vertical plane of the stem: **4**
- Flowers either solitary on long peduncles or peduncles several-flowered; sepals usually 6 mm. or more long; leaves flat, more or less unequally bilobed at the apex, usually more than 4 cm. long, not lying in the vertical plane of the stem: **6**
- 4 Leaves falcately oblong-elliptical, obtuse; spur 5-7 mm. long: **5**
- Leaves narrowly lanceolate-oblong, almost straight, subacute, 10-18 mm. long, 2-3 mm. broad; sepals 4.5-5 mm. long; spur 4.5-6 mm. long [3. podochiloides](#)
- 5 Leaves 5-11 mm. long, 3-7 mm. broad, groove on upper margin narrow, only extending half way to apex; lip indistinctly 3-lobed [1. distichum](#)
- Leaves 14-25 mm. long, 6-10 mm. broad, groove on upper margin broad, extending nearly to apex; lip distinctly 3-lobed [2. aporoides](#)
- 6 Sepals over 3 cm. long: **7**
- Sepals 2.5 cm. or less long; lip usually with a central low keel in basal part: **9**
- 7 Spur (measured from apex of ovary) over 10 cm. long, sharply incurved, narrowly conical in basal part; sepals lanceolate-linear, 6-8 cm. long; stem elongated, rooting; leaves oblong or elliptical, unequally lobed, up to 16 cm. long and 4 cm. broad; peduncle 4-7 cm. long, pedicel about equalling the peduncle; lip boat-shaped, broadly elliptical with a long apiculus, equalling the sepals [16. infundibulare](#)
- Spur less than 5 cm. long, almost straight, broadly conical at the base, constricted in the middle, fusiform in the apical portion; lip broad, nearly orbicular or more or less wedge shaped, nearly as long as sepals, long apiculate: **8**
- 8 Sepals 3.5-5 cm. long (usually less than 4.5 cm.); lip almost orbicular, 2.5-3.5 cm. broad, side lobes rounded, not projecting forward beyond the base of the central apiculus; leaves 7-14 cm. long, 1.5-3.5 cm. broad [14. birrimense](#)
- Sepals 3.5-6 cm. long (usually not less than 4.5 cm.); lip broadest in the front, 4-5 cm. broad, side lobes projecting forward beyond the base of the central apiculus so that the lip is more or less cordate; leaves 7-10 cm. long, 1.5-4 cm. broad [15. eichleranum](#)
- 9 Stems short, usually less than 4 cm. long; flowers up to 5, very small, green, sepals less than 4 mm. long; ovary short, twisted round the short obtuse spur; leaves linear or narrowly ligulate, 2-7 cm. long, 2-6 mm. broad; sepals broadly lanceolate; petals linear; lip a little shorter, very concave with a short apiculus. ... [6. sacciferum](#)
- Stems elongated; flowers larger, sepals 7 mm. long or more: **10**
- 10 Spur about equalling the lip in length; flowers white, flesh-coloured or pale buff; leaves much narrowed in upper part, often with a more or less acute bilobed apex: **11**
- Spur distinctly longer than the lip; flowers green, yellow-green or pale yellow; leaves more or less oblong, usually only narrowed at or near the apex itself: **13**
- 11 Lip triangular-ovate with a broad almost cordate base, 14-21 mm. long; petals thread-like from a broad base, much narrower than the sepals; leaves narrowly or ovate-lanceolate, very unequally and acutely lobed at apex, 4-9 cm. long, 8-23 mm. broad; spur with a swollen base and club-shaped apex, 12-19 mm. long; flowers white or pale buff-coloured [13. angustipetalum](#)
- Lip narrowly or broadly lanceolate, not much wider at the base and not at all cordate; petals narrower than the sepals but not thread-like: **12**
- 12 Leaves very narrowly lanceolate or almost linear, with a long narrow apex, 3-8.5 cm. long, 4-8 mm. broad, unequally and acutely bilobed at the apex; sepals about 2 cm. long, narrowly lanceolate; lip similar, about 15 mm. long; spur a little shorter than the lip, with a narrow conical basal half and a somewhat swollen apical half which is slightly inflexed; inflorescence 103-flowered [12. modicum](#)
- Leaves broadly elliptical-lanceolate or elliptical-oblong, with a blunt, bilobed apex. 1.5-4.5 cm. long, 7-20 mm.

broad; sepals 6-11 mm. long, broadly lanceolate or elliptical; lip lanceolate-ovate, 4-7.5 mm. long; spur about 7 mm. long, swollen at apex with an almost globose or ellipsoid sac [11. egertonii](#)

- 13** Lip narrowed just above the column, suddenly widened in the middle, running out at the apex into a long narrow point, about 13 mm. long; spur 2 cm. long, the base wide, middle constricted, apical half rather swollen; leaves very unequally and acutely bilobed, 3-7 cm. long, 6-12 mm. broad; inflorescence 2-4-flowered ... [9. angustum](#)

Lip widest just above the column, lanceolate to ovate, usually less than 10 mm. long: **14**

- 14** Leaves narrowly strap-shaped, usually less than 1 cm. broad, often much narrower and never exceeding 1.5 cm., parallel sided almost to apex, apex unequally bilobed with the two lobes rounded, 3-7 cm. long; pollinia attached to a single large strap-shaped pointed viscidium, stipites short and pointed; sepals 10-17 mm. long; lip with a recurved pointed apex, nearly 1 cm. long; spur gently curved, slightly swollen in apical part, 15-20 mm. long [10. chevalieri](#)

Leaves oblong or narrowly oblong, usually over 1 cm. broad, narrowing somewhat below the apex, apical lobes more or less connivent; pollinia attached to separate viscidia, stipites wider and rounded at apex: **15**

- 15** Spur widest just beyond the middle, tapering in both directions but mouth again widened, apex almost acute, 11-14 mm. long; leaves markedly unequally bilobed at the apex, the shorter lobe very short sometimes scarcely evident, 3-10 cm. long, 1-2 cm. broad; sepals and petals lanceolate, acute, 8-10 mm. long; lip ovate, acute, about 6 mm. long [7. multinominatum](#)

Spur widest near the apex, where it is swollen and club-shaped, the apex itself rounded, 10-14 mm. long; leaves only slightly unequally bilobed, the shorter lobe quite distinct, 2.5-11 cm. long, 7-22 mm. broad; sepals and petals oblong or oblong-lanceolate, obtuse or acute, 6-11 mm. long; lip ovate, acute, 5.5-7.5 mm. long [8. pyriforme](#)

39. MICROCOELIA

Lindl., Gen. and Sp. Orch. Pl. 60 (1830).

- 1 Limb of lip very small, 2-4 mm. long, less than half as long as the straight spur: **2**
Limb of lip nearly equalling or longer than the spur which is usually curved: **3**
- 2 Rostellum very short, arising from near the apex of the short thick column; viscidium reniform-oblong, about as long as broad; limb of lip 2 mm. long with 2 very obscure small lateral lobes at the base; spur about 2 cm. long, narrowed from the mouth to 5 mm. from apex, then suddenly swollen, tapering from there to the end; sepals and petals 2-3-5 mm. long [2. microglossa](#)
Rostellum arising from near the base of the long slender column and projecting upwards, bilobed from the base; stipes long and slender, sharply bent in the middle so that the 2 halves are nearly parallel; viscidium oblong-lanceolate, nearly as long as the rostellum; limb of lip 2-4 mm. long, narrowed towards the base; spur 8-13 mm. long, narrowed just near the mouth, much swollen in the middle and again slightly at the apex; sepals and petals 2-5-4 mm. long [3. caespitosa](#)
- 3 Lip obovate, 2-5-3-5 mm. long; column short, truncate at apex; anther transversely placed on column, not drawn out into a point in front; rostellum shortly 2-lobed, at apex of column; stipes of pollinium short, viscidium oblong; sepals and petals 2-4 mm. long; spur about the same length as the lip, slightly incurved or recurved, not at all swollen at the apex; inflorescence up to 13 cm. long, many-flowered [1. guyoniana](#)
Lip over 5 mm. long, much narrowed at the base, sometimes with a distinct claw; column relatively long, very obliquely truncate; anther obliquely placed on column, drawn out into a long point, covering the pollinarium; rostellum near base of column with 2 projecting fleshy lobes; stipes of pollinium long and slender, viscidium linear; inflorescences up to 9 cm. long, many-flowered: **4**
- 4 Spur sharply bent beneath the lip, much swollen and rounded at apex, 5-5-6-5 mm. long; lip ovate or elliptical-ovate narrowed to a short claw at base, total length 6-9 mm. long; lobes of the rostellum narrow and more or less pointed; stipes of pollinia forked in the upper part; sepals 4-7 mm. long, laterals markedly curved [4. dahomeensis](#)
Spur more or less S-shaped, incurved with the apex slightly recurved, not much swollen at apex, 6-5-11 mm. long; lip ovate or diamond-shaped, narrowed at base, 5-8-5 mm. long; lobes of rostellum blunt and rounded; stipes of pollinia entire; sepals 4-8-5 mm. long, laterals oblique but scarcely curved [5. koehleri](#)

1. **Microcoelia guyoniana** (*Rchb. f.*) *Summerh.* in Bot. Mus. Leafi. Harv. Univ. 11: 144 (1943).

APD: Synonym of Microcoelia globulosa (Ridl.) L. Jonss.

Angraecum guyonianum *Rchb. f.* (1849)-F.T.A. 7: 148.

Flowers white, apical part of spur greenish, brownish or salmon-coloured.

N. Nig.: Gindiri, E. edge of Jos Plateau, 3,000 ft. (Mar.) King! Heipang, Jos (Apr.) Keay et al. FHI 37609!

Also in **E. Cameroun**, **Gabon**, **Congo** and **Uganda**.**41. CHAULIODON***Summerh. in Bot. Mus. Leaf. Harv. Univ. 11; 163 (1943).*

- 1** Stem very short; inflorescences slender, up to 60 cm. long, rather laxly many-flowered; bracts very small; sepals and petals 3-5 mm. long, lateral sepals wider in the upper part, curved abruptly in the middle; lip consisting mostly of the large incurved spur; limb very short and acute, with a tooth-like erect callus about 2 mm. tall just in front of the spur opening; spur 12-14 mm. long, 3-3.5 mm. broad at the mouth, narrowing to just beyond the middle where it is abruptly curved forward, the apical portion slightly swollen; column rather short and recurved, anther drawn out into a long point in front; stipes of pollinia much widened above and enveloping the pollinia, viscidium very small [buntingii](#)

Chauliodon buntingii Summerh. l.c. 164 (1943).*APD: Synonym of Chauliodon deflexicalcaratum* (De Wild.) L. Jonss.

Flowers pale or orange-brown.

Lib.: Mt. Barclay (June) Bunting 9! **Ghana:** Tarkwa (Jan., July) Vigne FH 4838! Cox 120! Bunsu (fr. Sept.) Westwood 150! 163! **S. Nig.:** Ogba Farm, Benin City (July) Maggs 125! Ajagbodudu, Benin (Aug.) Wright 57! Eket Talbot 3287!

42. DIAPHANANTHE*Schltr., Die Orchid. 593 (1914) (incl. Rhipidoglossum Schltr.).*

- 1** Stipites of pollinia attached to a common viscidium; rostellum pointed, divided into two narrow lobes on removal of the viscidium: **2**
 Stipites each with a separate viscidium; rostellum obtuse or rounded, fleshy, shortly 3-lobed on removal of viscidium: **8**
- 2** Stem short, bearing the leaves in a relatively dense tuft, sometimes as much as 9 cm. long but with leaves only in the upper half: **3**
 Stems much elongated, reaching over 1 m. in length, bearing the leaves at more or less regular intervals; leaves oblong-lanceolate to narrowly ovate, very distinctly and acutely bilobed at the apex, 5-14 cm. long, 1.5-4.5 cm. broad; inflorescences 5-18 cm. long, many-flowered, pendulous; sepals 3-5 mm. long; lip quadrate, 3-5 mm. long; spur a little longer than the lip [7. bidens](#)
- 3** Lip quadrate (4-sided) or nearly orbicular, not much narrowed in front, with a short apiculus in the centre of the broad often more or less truncate apex, the margins often toothed or fimbriate: **4**
 Lip narrowly ovate, elliptical-ovate, or elliptical, narrowed towards the apex which is obtuse or subacute, the margins almost or quite entire: **6**
- 4** Sepals 9-11 mm. long; leaves oblanceolate, curved, unequally bilobed or almost entire at the apex, 15-70 cm. long, 2.5-7 cm. broad; inflorescences many-flowered, pendulous, 15-55 cm. long; lip quadrate, 8-11 mm. long, margins shortly fimbriate; spur about as long as the lip [2. pellucida](#)
 Sepals less than 7 mm. long; leaves narrowly oblanceolate or ligulate, acutely bilobed or entire at apex, up to 20 cm. long, 7-30 mm. broad; inflorescences slender, less than 15 cm. long: **5**

- 5 Spur of lip shorter than lamina, less than 3 mm. long; lip suborbicular, 4 mm. long, 4-5 mm. broad, margins scarcely toothed; leaves linear-ob lanceolate, 5-7.5 cm. long, 7-13 mm. broad; inflorescences short, up to 4.5 cm. long, up to 6-flowered; sepals 3.5-4 mm. long [5. suborbicularis](#)
- Spur of lip longer than lamina or rarely equalling it, 5-8 mm. long; lip quadrate or quadrate-ovate, 5-6 mm. long, 4-6 mm. broad, margins usually toothed; leaves narrowly lanceolate or ligulate, up to 20 cm. long, 8-30 mm. broad; inflorescences up to 13 cm. long, many-flowered; sepals 4.5-6.5 mm. long [4. plehniana](#)
- 6 Leaves broadly oblanceolate, 2-5 cm. broad, 10-23 cm. long, unequally acute at apex; lip without any callus at mouth of spur, elliptical-ovate or elliptical, 6.5-8 mm. long, 4-5 mm. broad; spur about equalling the lip; inflorescence 10-25 cm. long, many-flowered [1. dorotheae](#)
- Leaves narrowly lanceolate or ligulate, 0.5-2 cm. broad, 4-15 cm. long; lip with callus at mouth of spur, narrowly ovate or elliptical-ovate; spur distinctly longer than the lip: [7](#)
- 7 Sepals 6-8.5 mm. long; spur 12-15 mm. long, apex broadened, truncate, more or less emarginate; stipites of pollinia very broad, adnate along their inner margins, long fimbriate on outer margins; lip narrowly or lanceolate-ovate, 4-8.5 mm. long; inflorescence 6-15 cm. long, 6-10-flowered; leaves lanceolate-ligulate, acute, 8-20 mm. broad [3. bueae](#)
- Sepals 3.5-5.5 mm. long; spur 6.5-13.5 mm. long, swollen in upper half but apex itself narrow, obtuse; stipites of pollinia narrow, linear, quite separate, entire; lip ovate or narrowly ovate, 3-4.5 mm. long; inflorescence 6-28 cm. long, 6-20-flowered; leaves ligulate or oblong-ligulate, acute or more frequently obtuse, 6-15 mm. broad [6. quintasii](#)
- 8 Stem very short, leaves in a bunch at its apex: [9](#)
- Stem elongated, leaves spaced out along the apical part: [11](#)
- 9 Lip 3-lobed, lateral lobes longly pectinate, front lobe much smaller, tooth-like, entire; petals shortly pectinate; spur filiform, about 2 cm. long; sepals and petals 4-4.5 mm. long; leaves linear-lanceolate, unequally and acutely bilobed at apex, 6-10 cm. long, 7-10 mm. broad; inflorescence 6-11 cm. long, 5-9-flowered [8. polydactyla](#)
- Lip entire or shortly toothed in front, shortly apiculate at apex; petals entire or very shortly toothed or fimbriate: [10](#)
- 10 Spur not quite so long as the lip; lip obovate from a narrow base, margins shortly toothed in front, 1.7-1.9 cm. long, callus at mouth of spur tooth-like; sepals 1.5-2 cm. long; leaves oblanceolate-linear to oblanceolate, 25-50 cm. long, 2-5 cm. broad; inflorescences 10-30 cm. long [9. kamerunensis](#)
- Spur more than 3 times as long as the lip, 10.5-16 mm. long; lip ovate or nearly orbicular with a broad base, 2.5-3 mm. long, callus at mouth of spur rim-like; sepals 3.5-4.5 mm. long; leaves oblanceolate, 4-17 cm. long, 1-4.5 cm. broad; inflorescences 10-35 cm. long, many-flowered [10. curvata](#)
- 11 Spur 2 or more times as long as the lip, not or hardly swollen towards apex; lateral sepals 3-4 mm. long; inflorescence many-flowered: [12](#)
- Spur less than twice as long as the lip, distinctly swollen in the apical part; lateral sepals 2-2.5 mm. long; lip transversely elliptical, about 1.5 mm. long and 3 mm. broad: [13](#)
- 12 Lip longer than broad, 3-3.5 mm. long, quadrate, truncate in front, slightly emarginate with sometimes a small apiculus in the sinus, margins irregular; spur 11-13 mm. long, very slender; viscidia more than half as long as stipites; leaves 9-14 cm. long, 6-16 mm. broad, acute [11. longicalcar](#)
- Lip broader than long, about 2-3 mm. long, 2.5-4.5 mm. broad, flabellate-elliptical, obscurely 3-4-lobed in front; spur 5-12 mm. long; viscidia very small, much less than half as long as stipites; leaves 6-15 cm. long, 5-30 mm. broad, unequally and obtusely bilobed [12. rutila](#)
- 13 Leaves 1.5-2.5 cm. broad, 6-11 cm. long; flowers 1-1.5 mm. apart; inflorescence many-flowered; lip slightly retuse [13. obanensis](#)
- Leaves 5-10 mm. broad, 4-11 cm. long; flowers 4-5 mm. apart; inflorescence up to 20-flowered; lip with a broad blunt projecting apex [14. laxiflora](#)

Rhipidoglossum laxiflorum Summerh. in Kew Bull. 1936: 225; F.W.T.A., ed. 1, 2: 449.

Flowers whitish green or yellow-green.

Iv. C.: Mt. Goula, near Danané (Apr.) Chev. 21213! **Ghana:** Aburi (Mar.) Johnson 858! Amedzofe (Mar.) Westwood 52!

43. SARCORHYNCHUS

Schltr. in Beih. Bot. Centralbl. 36, 2: 104 (1918).

- 1 Stem up to 15 cm. long; leaves linear-oblong, unequally and connivently bilobed at the apex, 3-9 cm. long, 5-13 mm. broad; inflorescence 4-22 cm. long, many-flowered; sepals 2-5-4 mm. long; lip 2-7-3-6 mm. long; spur shorter than the lip, swollen in the apical part [polyanthus](#)

Sarcorhynchus polyanthus (Kraenzl.) Schltr. l.c. 105 (1918).

APD: Synonym of Rhipidoglossum polyanthum (Kraenzl.) Szlach. & Olszewski

Mystacidium polyanthum Kraenzl. (1914).

Sarcorhynchus saccolabioides Schltr. l.c. 105 (1918).

Flowers greenish-white or very pale yellow; **in forest.**

W. Cam.: Kumbo, 6,700 ft. (Oct.) Ledermann 5741! 5763! Bafut-Ngemba F.R., Bamenda (July)! Daramola FHI 41573! **F. Po:** Parador to Moka (fr. Jan.) Sanford 4304!

44. BOLUSIELLA

Schltr. in Beih. Bot. Centralbl. 36, 2: 105 (1918).

- 1 Leaves with a deep V-shaped groove along the upper surface, very fleshy, more or less triangular in section, recurved, 1-5-4 cm. long; inflorescences usually overtopping the leaves, up to 5-5 cm. long; bracts shorter than the flowers; sepals 2-3 mm. long; lip oblong, rounded, 2-2-5 mm. long, spur ellipsoid, a little shorter than the lip [l. iridifolia](#)
Leaves not grooved along the upper surface or margin, flattened in a vertical plane, and arranged in a fan-like manner, more or less fleshy: **2**
- 2 Bracts nearly as long as, or longer than the flowers, overlapping one another at their base; leaves rather fleshy with convex surfaces, 1-3-5 cm. long, 3-9 mm. broad; inflorescences up to 7 cm. long, densely many-flowered; sepals 3-4 mm. long; lip narrowly oblong, 2-3 mm. long, spur shorter than the lip, not much swollen [2. imbricata](#)
Bracts distinctly shorter than the flowers, scarcely overlapping; leaves only slightly fleshy, the surfaces slightly convex or almost flat, up to 8 cm. long: **3**
- 3 Peduncle usually longer than the rhachis; spike dense with flowers almost touching one another; leaves parallel-sided with nearly rounded apices, up to 6 cm. long and 7 mm. broad; inflorescences up to 20 cm. long; sepals

and lip about 3 mm. long; spur nearly as long as the lip [3. batesii](#)

Peduncle usually shorter than the rachis but sometimes equalling it in length; spike relatively lax with distinct spaces between the flowers; leaves narrowly lanceolate, distinctly narrowed in the upper half, the apices acute, up to 8 cm. long and 12 mm. broad; inflorescence up to 10 cm. long; sepals 1.7-4 mm. long; lip 1.7-2.5 mm. long, with a broad base and narrow acute apical part, spur conical, a little longer than or equalling the lip [4. talbotii](#)

1. **Bolusiella iridifolia** (Rolfe) Schltr. in Beih. Bot. Centralbl. 36, 2: 106 (1918). *APD acc*

Listrostachys iridifolia Rolfe in F.T.A. 7: 48 (1897).

Flowers white.

iv. C.: Hiré, Kagbe to Dekadougou (Dec., Aké Assi 9342! **Ghana:** Ofinso (Nov.) Cox 106! Konongo, Ashanti (fr. Jan.) Westwood 79a! Kumasi (fr. Dec.) Westwood 79! Prasu (Oct.) Westwood 178!

Also in **E. Cameroun**, **Congo**, **Uganda**, **Kenya** and **Angola**.

2. **Bolusiella imbricata** (Rolfe) Schltr. l.c. 106 (1918).

APD: Synonym of Bolusiella maudiae (Bolus) Schltr.

Listrostachys imbricata Rolfe in Kew Bull. 1910: 161.

Flowers white, spur pale olive green.

Ghana: Akumadan, Ashanti (Aug.) Vigne FH 2436! Dunkwa (Oct.) Blayney! Ksi to Tamale (fr. Nov.) Westwood 98! Tarkwa (July) Cox 121! Agu Junction, Anum (Sept.) Westwood 42!

45. CHAMAEANGIS

Schltr. in Beih. Bot. Centralbl. 36, 2: 107 (1918).

1 Flowers always 1 at each node of the inflorescence: **2**

Most of flowers in pairs, or in whorls of 3-6 at each node of the inflorescence (the lower flowers sometimes occur singly); lip entire; inflorescences 8-35 cm. long: **3**

2 Lip oblong, shortly 3-lobed or 3-toothed at the apex, 5-6 mm. long; spur 13-18 mm. long, swollen part ellipsoid-fusiform, 6-10 mm. long; petals oblong, obtuse; leaves 17-43 cm. long, 2.5-4.5 cm. broad; inflorescences 20-50 cm. long; sepals 5-6 mm. long [1. ichneumonea](#)

Lip lanceolate or triangular-lanceolate, acute at the apex, 2.5-3.5 mm. long; spur about 12 mm. long, swollen part about 3-4 mm. long; petals lanceolate, acute; leaves 6-28 cm. long, 0.7-2 cm. broad; inflorescences up to 35 cm. long; sepals 3.5-5 mm. long [2. lanceolata](#)

- 3 Leaves oblong to ligulate, with usually rounded unequally bilobed apices, 10-24 cm. long, 1.5-3 cm. broad, leathery but not very fleshy; flowers in whorls of 3-6; sepals obtuse, 1.5-2.5 mm. long; petals orbicular or very broadly ovate; lip elliptical, about 2 mm. long, spur only slightly swollen in apical half, 7-12 mm. long [3. odoratissima](#)

Leaves linear or narrowly lanceolate, with acute apices, often much curved, 15-40 cm. long, 0.7-3 cm. broad, fleshy, often V-shaped in section; flowers single in lower part of inflorescence, in twos or threes in upper part; sepals acute, 1.5-3 mm. long; petals lanceolate; lip lanceolate, 1.5-3 mm. long, spur at apex swollen into an ellipsoid or globular sac, 4.5-10 mm. long [4. vesicata](#)

1. **Chamaeangis ichneumonea** (Lindl.) Schltr. in Beih. Bot. Centralbl. 36,2: 108 (1918). *APD acc*

Angraecum ichneumoneum Lindl. (1862).

Listrostachys ichneumonea (Lindl.) Rchb. f. (1887)-F.T.A. 7: 163.

Flowers white, cream coloured or greenish brown, fragrant, especially at night.

S. L.: Juring (Dec.) Deighton 318! Massa, Peri (Nov.) Deighton 4959! **Lib.:** Mt. Barclay (June, July) Bunting 15! 157! Karmadhun, Kolahun (Nov.) Baldwin 10201! **Ghana:** Kumasi (Aug.) Cox 122! **S. Nig.:** Jamieson R., Sapoba (Nov.) Keay FHI 22704! Nun R. (Sept.) Mann 520! Degema Talbot 3259!

Also in **Gabon**.

2. **Chamaeangis lanceolata** Summerh. in Kew Bull. 12: 279 (1958). *APD acc*

Flowers greenish ochraceous, faintly fragrant.

S. Nig.: Jamieson R., Sapoba (Nov.) Meikle 607! Kennedy 2731! 2732! Oban F. R. (Nov.) Markham FHI 50083!

3. **Chamaeangis odoratissima** (Rchb. f.) Schltr. in Beih. Bot. Centralbl. 36, 2: 108 (1918). *APD acc*

Angraecum odoratissimum Rchb. f. in Bonplandia 4: 326 (1856).

Flowers pale green, greenish yellow or greenish ochraceous.

47. AERANGIS

Rchb. f. in Flora 48: 190 (1865). *APD acc*

- 1 Spur 13-22 cm. long, spirally twisted; leaves broadly oblanceolate, unequally bilobed at apex, 7-23 cm. long, 1.5-6 cm. broad; inflorescences 15-60 cm. long, up to 15-flowered; sepals and petals 2-3 cm. long; lip about the same length, much wider than the sepals in the middle [1. kotschyana](#)
 Spur less than 8 cm. long, not much twisted, sometimes curled at apex: **2**
- 2 Leaves linear or narrowly strap-shaped, less than 1 cm. broad; sepals less than 12 mm. long: **3**
 Leaves more or less oblanceolate, often much wider in the upper half, usually over 1.5 cm. broad; sepals usually over 12 mm. long, often much longer: **4**
- 3 Spur 2.5-4 cm. long, apex usually incurved; leaves 3-8 cm. long, 4-8 mm. broad, shortly unequally and acutely bilobed at apex, rather thin in texture; sepals 7-12 mm. long, subacute; inflorescence up to 11 cm. long, up to 8-flowered; lip oblong-lanceolate [5. calantha](#)
 Spur 6-7.5 cm. long, not incurved at apex; leaves 10-22 cm. long, 6-9 mm. broad, rounded-bilobed at apex, rather thick and stiff; sepals 7-8 mm. long, rounded at apex; inflorescence 13-40 cm. long, many-flowered; lip ovate or elliptical-ovate [6. laurentii](#)
- 4 Distance between bracts subtending flowers less than 2.5 cm.; spur 3-5.5 cm. long; sinus between apical lobes of leaf acute or obtuse, shorter lobe with a distinct free end; leaves oblanceolate, 6-22 cm. long, 1.2-6 cm. broad; inflorescences 9-40 cm. long, 5-20-flowered; sepals 1.2-2.5 cm. long; lip very similar to the sepals, usually a little broader [3. biloba](#)
 Distance between bracts subtending flowers more than 2.5 cm.; spur 5.5-7 cm. long; leaves obliquely acute or obscurely bilobed at apex, sinus scarcely distinguishable; sepals lanceolate, acuminate; lip almost indistinguishable from the sepals: **5**
- 5 Inflorescence 10-21 cm. long, 2-5-flowered, rhachis almost straight, relatively stout, bracts 7-9 mm. long; sepals 2-3 cm. long; leaves 5-15 cm. long, 1-2.5 cm. broad, no sinus at apex [2. gravenreuthii](#)
 Inflorescence 30-60 cm. long, 5-15-flowered, rhachis zigzag in upper part, very slender, bracts 3-5 mm. long; sepals 2 cm. long or less; leaves 7-18 cm. long, 2-5.5 cm. broad, sinus at apex very shallow; column slender, 5 mm. long [4. arachnopus](#)

1. Aërangis kotschyana (Rchb. f.) Schltr. in Beih. Bot. Centralbl. 36, 2: 118 (1918). *APD acc*

APD: *Synonym of Aerangis verdickii (De Wild.) Schltr.*

Angraecum kotschy anum Rchb. f. (1864)-F.T.A. 7: 137.

Flowers white, sometimes tinged pink, spur pink or salmon coloured, fragrant.

48. BAROMBIA

Schltr., Die Orchid. 600 (1914). *APD acc*

- 1 Stem short; leaves oblanceolate, unequally bilobed at apex, 10-25 cm. long, 2-6.5 cm. broad; inflorescence 25-80 cm. long, 3-11-flowered; sepals and petals very narrow, 4-5.5 cm. long; spur very slender, swollen at end, 17-

22 cm. long [gracillima](#)

Barombia gracillima (*Kraenzl.*) *Schltr.* in *Beih. Bot. Centralbl.* 36, 2: 124 (1918).

APD: *Synonym of Aerangis gracillima* (*Kraenzl.*) *Arends & J. Stewart*

Angraecum gracillimum *Kraenzl.* (1893)-*F.T.A.* 7: 140.

Flowers white or pale green, ends of tepals reddish, spur pale brown.

W. Cam.: Barombi (Sept.) Preuss 459!

Also in **Gabon**.

49. RANGAËRIS

Summerh. in *Kew Bull.* 1936: 227.

- 1 Lip 3-lobed, 5-9 mm. long, middle lobe lanceolate or linear, obtusely acuminate, lateral lobes much shorter, almost orbicular, crenulate or dentate; stem very long and slender, leaves placed at intervals of 2-5 cm; leaves narrowly oblong-lanceolate, acute, 4-8 cm. long, 1-2 cm. broad; inflorescence few-flowered, 4-12 cm. long; sepals and petals 6.5-8.5 mm. long; spur 3.5-4.5 cm. long [4. trilobata](#)
Lip entire, sometimes slightly crenulate along the lower margins:.....2
- 2 Spur 15-19 cm. long; stem elongated, about 0.5 cm. diam.; leaves narrowly oblong, obscurely unequally bilobed at apex, 6-12 cm. long, 1-1.5 cm. broad; inflorescences 8-15 cm. long, 3-4-flowered, bracts 10-15 mm. long; sepals and petals lanceolate, acuminate, 2-3.5 cm. long; lip like sepals; column semi-terete, about 6 mm. long; viscidium rectangular, 3 mm. long, stipites much broadened in the upper part [3. longicaudata](#)
Spur less than 10 cm. long:3
- 3 Bracts broadly ovate or almost orbicular, obtuse, sheathing at base, 2.5-7 mm. long; lip lanceolate with a thickened callose apex; viscidium single, rectangular, elliptical, or ovate, longer than broad; rostellum 3-lobed, middle lobe much shorter than laterals; leaves in a bunch at the base, 6-17 cm. long; inflorescences as long as or a little shorter than the leaves; sepals 6-9 mm. long:.....4
Bracts lanceolate, acute, not much sheathing, 2-5 mm. long; lip without thickened apex, about 4-6 mm. long, 2-4 mm. broad; viscidia 2, orbicular, scarcely longer than broad; middle lobe of rostellum longer than laterals; spur about equalling the lip, straight; leaves ligulate or slightly wider in the upper part, 6-16 cm. long, 1-2 cm. broad; sepals 4-6.5 mm. long [5. brachyceras](#)
- 4 Spur almost straight, 5-9 cm. long; leaves thin, V-shaped in section, very shortly bilobed or retuse at apex, the lobes rounded, 1-1.9 cm. broad; ovary glabrous or slightly scurfy [1. muscicola](#)
Spur incurved at apex, 7-14 mm. long; leaves fleshy. Iris-like, lying in a vertical plane, acute and entire at apex, 5-10 mm. broad; ovary densely hairy [2. rhipsalisocia](#)

1. **Rangaëris muscicola** (*Rchb. f.*) *Summerh.* in *F.W.T.A.*, ed. 1, 2: 450 (1936). *APD acc*

Aéranthus muscicola *Rchb. f.* (1865).

50. CYRTORCHIS

Schltr., Die Orchid. 595 (1914).

- 1 Viscidium linear, gradually tapering from apex to base, equal in texture throughout its length; sepals 1-2.5 cm. long; spur 2.5-4.5 cm. long:2
- Viscidium composed of a broad rather stiff hardened upper portion with recurved edges and a linear, hyaline and very thin lower portion:3
- 2 Leaves with nearly parallel sides, rigid and stiff in texture, cross veins not visible, almost equally bilobed at the apex with semi-orbicular lobes, 8-20 cm. long, 1.3-3 (usually less than 2.5) cm. broad; inflorescence up to 16 cm. long, flowers closely placed[L. ringens](#)
- Leaves oblong-elliptical or oblanceolate, tapering distinctly at both ends, not very rigid or stiff, the cross veins usually visible, especially in dried specimens, unequally bilobed at apex with more or less connivent lobes, 5-20 cm. long, 1.7-5.5 cm. broad; inflorescence up to 30 cm. long, middle flowers at intervals of 1-2 cm.[2. monteiroae](#)
- 3 Upper hardened part of viscidium over 3 mm. long, longer than the hyaline part; spur 9-15 cm. long, very slender; sepals 3-5 cm. long; leaves oblong-oblanceolate or oblong, unequally bilobed at apex with connivent rounded lobes, 8-25 cm. long, 1.7-3.5 cm. broad; inflorescences up to 24 cm. long, bracts broad and sheathing, 1-2.5 cm. long[3. chailluana](#)
- Upper hardened part of viscidium less than 2.5 mm. long, usually distinctly shorter than the hyaline part; spur usually less than 6 cm. long but sometimes up to 10 cm. and then distinctly wider in the basal than in the apical half:4
- 4 Leaves long and narrow, with almost parallel sides, often very fleshy and apparently terete, almost equally bilobed at the apex, 8-22 cm. long, 2.5-15 mm. broad; anther only shortly extended in front, which is often

much toothed; hardened upper part of viscidium short and broad, not tapering towards the hyaline part; sepals 1-2 cm. long; spur recurved or more or less S-shaped, 1.5-4 cm. long; bracts 5-10 mm. long[6. aschersonii](#)

Leaves relatively broad, 1.3-4 cm. broad, unequally bilobed at the apex; anther in front extended into a long tapering entire or almost entire appendage; hardened upper part of viscidium tapering towards the hyaline part; inflorescences 5-17 cm. long; bracts often over 1 cm. long:[5](#)

- 5** Spur with a thickened hooked or almost rolled-up apex, 3.5-5 cm. long; leaves ligulate, 9-24 cm. long, 1.5-4 cm. broad; sepals 2-4 cm. long[5. hamata](#)

Spur almost straight, or more or less curved, but apex not hooked or rolled-up; leaves 8-24 cm. long, 1.5-4 cm. broad:[6](#)

- 6** Spur 6-10.5 cm. long; sepals 2.5-5 cm. long; stipites of viscidium broadly oblanceolate [4a. arcuata subsp. whytei](#)

Spur less than 6 cm. long:[7](#)

- 7** Stipites of the pollinia narrowly oblanceolate; hyaline part of viscidium twice as long as the hardened part; anther toothed in front; sepals 1.2-2 cm. long; spur 3.5-4.5 cm. long, not much curved ..[4b. arcuata subsp. leonensis](#)

Stipites of the pollinia broadly oblanceolate; hyaline part of viscidium about half as long again as the hardened part; anther entire in front; sepals 1.5-3.5 cm. long; spur 3-5.5 cm. long, almost straight or somewhat S-shaped[4c. arcuata subsp. variabilis](#)

1. *Cyrtorchis ringens* (Rchb. f.) Summerh. in Kew Bull. 12: 87 (1958).

54. ANCISTRORHYNCHUS

Finet in Mém. Soc. Bot. Fr. 2: 44 (1907). *APD acc*

Cephalangraecum *Schltr.* (1918)-F.W.T.A. ed. 1, 2: 461.

- 1 Leaves 3 cm. long or less, narrowly oblong, 3-7.5 mm. broad, shortly bilobed with rounded lobes; inflorescences very short, 1-3-flowered; bracts small, much shorter than the flowers; tepals oblong, 2-3 mm. long; lip broadly ovate, 2-3 mm. long; spur 2-2.5 mm. long, slightly swollen above the base; stem elongated, up to 15 cm. long [8. schumannii](#)
- Leaves much longer than 3 cm.; inflorescences more than 3-flowered, often many-flowered; bracts small or exceeding the flowers in length: **2**
- 2 Stipes of pollinia single but shortly forked at the apex; leaves usually very unequally bilobed at apex, the shorter lobes sometimes almost or completely suppressed; inflorescence up to 4 cm. long, only moderately dense, bracts short, much shorter than the flowers; lip distinctly 3-lobed, the middle lobe much crisped; spur more or less S-shaped, swollen at apex: **3**
- Stipites of pollinia 2, distinct; leaves with rounded or subacute apical lobes which are sometimes toothed; inflorescences in the form of dense heads, often with large chaffy bracts nearly as long as the flowers; lip entire or only indistinctly 3-lobed; spur straight or slightly curved: **4**
- 3 Apical lobes of leaf very acute and unequal in length, the longer one up to 7 cm., the shorter one sometimes quite lacking so that the apex appears to be entire; leaves stiff and leathery, up to 1.8 m. long and 3-6 cm. broad; sepals 3-5.5 cm. long; lip 5-7.5 mm. long [1. clandestinus](#)
- Apical lobes of leaf subacute or obtuse, the longer one up to 4 cm., both sometimes shortly lobulate; leaves less stiff, relatively broader, up to 37 cm. long, 0.7-3 cm. broad; sepals 3-4.5 mm. long; lip 4-5.5 mm. long [2. recurvus](#)
- 4 Apex of leaf serrate or with a few sharp teeth on each side just below: **5**
- Apex of leaves bilobed but margins quite entire: **6**
- 5 Leaves 1.5-3 cm. broad 17-44 cm. long, often tapering in the upper part, with a few sharp teeth on each side below the apex, lobes themselves with a small sharp point; sepals 3.5-6.5 mm. long; lip a little longer than broad, 4.5-5.7 mm. long, 3.5-5 mm. broad; spur 7-11 mm. long [3. capitatus](#)
- Leaves 7-10 mm. broad, 5-11 cm. long, with parallel sides, with rounded irregularly serrate lobes at the apex, margins otherwise entire; sepals 3-3.5 mm. long; lip distinctly broader than long, 2.5 mm. long, 4-4.5 mm. broad; spur 4-4.5 mm. long [6. serratus](#)

- 6 Spur over 5 mm. long, usually distinctly longer than the lip; sepals 4·5-7 mm. long:.....7
 Spur 4 mm. long or less, about as long as, or shorter than, the lip; sepals 1·5-5 mm. long:8
- 7 Leaves 7-35 cm. long, 8-19 mm. broad; lip as broad as long, or broader, indistinctly 3-lobed with rounded lobes, 4-7 mm. long, 4-9 mm. broad; spur 6-10 mm. long4. *cephalotes*
- 8 Sepals 1·5-2·5 mm. long; leaves 3-13 mm. broad, 5-13 cm. long, rather unequally bilobed at the apex, the lobes sometimes divergent; lip 3-lobed at base, about 1·75 mm. long; spur 1·5-3·5 mm. long, equalling or slightly longer than the lip; bracts shorter than the pedicel and ovary7. *straussii*
- Sepals 3·5-5 mm. long; leaves 7-24 mm. broad, 5-21 cm. long, slightly unequally bilobed at apex, the lobes straight or connivent; lip entire, 3·5-4·5 mm. long and broad; spur 2·5-4 mm. long, usually shorter than the lip; bracts large scarious, longer than the pedicel and ovary5. *metteniae*

1. **Ancistrorhynchus clandestinus** (Lindl.) Schltr. in Beih. Bot. Centralbl. 36, 2: 138 (1918); F.W.T.A., ed. 1, 2: 462 (excl. syn. *A. recurvus* Finet and Cummins 87). *APD acc*

55. ANGRAECOPSIS

Kraenzl. in Engl., Bot. Jahrb. 28: 171 (1900). *APD acc*

- 1 Spur longer than the lip, 6-38 mm. long, very slightly or not at all swollen in the apical part:2
 Spur about the same length as the lip, or shorter, 2-5 mm. long; petals narrowly or triangular-ovate, longer than broad:3
- 2 Petals broader than long (measured from apex to base of central vein) broadly triangular, 1.7-2.2 mm. long, 2.3-3 mm. broad; spur 12-38 mm. long; leaves elliptical-oblong, elliptical-ligulate or ligulate, 2-11 cm. long, 4-13 mm. broad, apical lobes unequal, rounded or obtuse; inflorescences 3-9 cm. long [1. ischnopus](#)
 Petals longer than broad, triangular, 1.5-2 mm. long, 1.3-1.8 mm. broad; spur 6-9 mm. long; leaves narrowly ligulate, curved, up to 18 cm. long, 4-12 mm. broad, acute or very unequally lobed with the shorter lobe tooth-like; inflorescences up to 17 cm. long [2. parviflora](#)
- 3 Leaves linear or narrowly ligulate, somewhat curved, 2.9-5 cm. long, 4-15 mm. broad; side lobes of lip slightly longer than the middle lobe; spur shorter than the lip, distinctly swollen at the apex, 2-3 mm. long; lateral

sepals scarcely widened in the apical half, 3·5-4 mm. long; petals 2-2·7 mm. long, about 1·5 mm. broad; inflorescences 4-7 cm. long [3. tridens](#)

Leaves elliptical-oblong or oblanceolate, scarcely curved, 4-10 cm. long, 1-2·5 cm. broad; side lobes of lip distinctly shorter than the middle lobe; spur about equalling the lip, not much if at all swollen at the apex, 2·7-5·2 mm. long; lateral sepals distinctly widened in the apical half, 3-4·7 mm. long; petals 2-2·3 mm. long, 1·5-2 mm. broad; inflorescences 3·5-18 cm. long [4. elliptica](#)

57. TRIDACTYLE

Schltr., Die Orchid. 601 (1914).

- 1 Leaves needle-like, almost terete, with a groove along the upper surface, up to 12 cm. long, but only 1-2 mm. diam.; inflorescences very short, up to 7 mm. long, few-flowered; sepals 1·5-2·5 mm. long; lip trilobed above

- the middle, the side lobes tooth-like, triangular, much shorter than the middle-lobe; spur slender, 6-8 mm. long [5. tridentata](#)
- Leaves not needle-like, more or less flattened though sometimes fleshy, more than 4 mm. broad: **2**
- 2** Spur distinctly shorter than the lip; lip trilobed: **3**
- Spur much longer than the lip, often more than twice as long: **4**
- 3** Inflorescences less than 5 mm. long, few-flowered; spur 4-5-6 mm. long, club-shaped; leaves linear-lanceolate or narrowly ligulate, 4-7-5 cm. long, 4-9 mm. broad, unequally bilobed at apex; lip 6-7 mm. long, side lobes spreading; sepals 3-4-5 mm. long [6. lagosensis](#)
- Inflorescences 2-6 cm. long, many-flowered; spur less than 1 mm. long, not at all swollen above the base; leaves ligulate, 6-11 cm. long, 7-10 mm. broad, only slightly unequally bilobed at apex; lip 3 mm. long, side-lobes projecting forward; sepala 2-5-3-5 mm. long [9. brevicecarata](#)
- 4** Spur 3 cm. long or longer: **5**
- Spur less than 2-5 cm. long: **6**
- 5** Side lobes of lip reduced to teeth; lip 6-5 cm. long with long narrow acute middle lobe; spur 3 cm. long, slightly thickened towards apex; leaves linear-oblong, broadly and obtusely bilobed at apex, 5-6-5 cm. long, 7-9 mm. broad; sepals 7-7-5 mm. long; inflorescence unknown, but probably short [3. muriculata](#)
- Side lobes of lip much longer than middle lobe, divided into short or long fimbriae at apex; lip 7-14 mm. long (from apex of ovary), middle lobe triangular-lanceolate, 2-5 mm. long, side lobes 7-9-5 mm. long; spur 3-5-8-5 cm. long, not at all thickened; leaves ligulate, 8-20 cm. long, 7-30 mm. broad; sepals 6-9 mm. long; inflorescences 3-5-11 cm. long, up to 12-flowered [12. gentilii](#)
- 6** Side lobes of lip much diverging, as long as or longer than the middle lobe; inflorescence up to 8 cm. long, many-flowered; leaves ligulate or lanceolate-ligulate, unequally bilobed at apex, 5-20 cm. long: **7**
- Side lobes of lip reduced to teeth, much shorter than the middle lobe, or absent: **9**
- 7** Side lobes of lip divided in upper part into numerous hair-like portions; leaves narrowly ligulate, not much narrowed in upper part, 4-10 mm. broad, only rarely broader; spur slender, 11-23 mm. long; sepals 3-5-5-5 mm. long [11. bicaudata](#)
- Side lobes of lip entire, or rarely very shortly divided at the apex; leaves ligulate or lanceolate-ligulate, distinctly but gradually narrowed in the upper part, 1-2 cm. broad: **8**
- 8** Spur very slender, scarcely thickened in the apical part, 7-11 mm. long; sepals 3-5-5 mm. long; lip 3-5-6 mm. long, 5-5-8 mm. broad across the side lobes [10. tridactylites](#)
- Spur distinctly swollen in the apical two-thirds, 6-8-5 mm. long; sepals 2-5-4-5 mm. long; lip 2-5-4-5 mm. long, 3-5-5-6 mm. broad across the side lobes [8. armeniaca](#)
- 9** Inflorescences up to 4 cm. long; leaves linear-ligulate, unequally bilobed at apex, up to 18 cm. long and 13 mm. broad; flowers not lepidote; sepals 2-4 mm. long; lip equalling sepals, ovate with a short tooth on each side below the middle; spur 5-8 mm. long [7. fusifera](#)
- Inflorescences very short, less than 5 mm. long, 1-3-flowered; ovary and sepals with numerous black scurfy hairs or scales (lepidote); basal auricles of lip prominent: **10**
- 10** Leaves very fleshy, more or less deltoid or V-shaped in section, the upper surface concave with a narrow groove along the centre, the lower surface convex, sometimes with a rounded keel, lanceolate-ligulate, distinctly tapering towards the apex, 3-8 cm. long, 6-10 mm. broad, unequally bilobed; sepals 3-5-5 mm. long; lip lamina entire or side lobes extremely small; spur slender, 10-15 mm. long [2. crassifolia](#)
- Leaves flat or sometimes convex as a result of the recurving of the margins, sometimes rather fleshy, ligulate, oblong or elliptical-oblong, usually not much tapering in the upper part: **11**
- 11** Leaves rather fleshy, broadly ligulate, oblong or elliptical-oblong, broadly and obtusely bilobed at the apex, 2-8 cm. long, 7-20 mm. broad; sepals 3-5-5-5 mm. long; lip lamina usually entire but basal auricles well developed and acute; spur 6-15 mm. long [1. anthomaniaca](#)
- Leaves scarcely fleshy, ligulate or narrowly oblong, unequally bilobed at the apex, 3-12 cm. long, 7-17 mm. broad; sepals 4-6 mm. long; lip lamina entire, basal auricles triangular, acute; spur 10-15 mm. long [4. oblongifolia](#)

58. NEPHRANGIS

Summerh. in Kew Bull. 2: 301 (1948).

- 1** Stems elongated, slender, usually more or less hanging, up to 35 cm. long, often branched; leaves needle-like, terete, usually curved, 1.5-9 cm. long, 1-2 mm. diam.; inflorescences very short, up to 1 cm. long, 1-3-flowered; sepals broad, obtuse, 1.5-2.7 mm. long; petals narrowly lanceolate; lip total length 4-5 cm., bilobed lamina 3.5-5 mm. broad; spur gradually narrowed to apex, 6-9 mm. long *filiformis*

***Nephrangis filiformis* (Kraenzl.) Summerh.** in Kew Bull. 2: 302 (1948). *APD acc*

Listrostachys filiformis Kraenzl. (1896)-F.T.A. 7: 169.

Sepals yellowish, brownish or orange, lip white.

Lib.: Ganta (June) Harley 1644! 1815!

Also in **Congo, Uganda** and **Zambia**.

\$/eflora

JUNCACEAE

Perennial or annual herbs. Leaves mostly in a basal tuft, grass-like, linear or filiform, sheathing at the base or reduced to a sheath, sheaths open or closed. Flowers hermaphrodite or unisexual, usually very small. Perianth-segments 6, in 2 whorls, or rarely only 3, usually glumaceous. Stamens 6 or 3, free; anthers 2-celled, basifixed, opening lengthwise; pollen in tetrads. Ovary superior, 1-celled or 3-celled; styles and stigmas 1 or 3. Ovules ascending or parietal, 3 or more. Fruit a dry capsule. Seeds sometimes tailed, with a small straight embryo in the middle of endosperm.

World-wide distribution, [mostly in temperate and cold or montane regions, often in damp places.](#)

- 1 Leaves flat, hairy on the margin with a closed basal sheath; ovary 1-celled, with 3 sub-basal ovules. ... [1. *Luzula*](#)
 Leaves subterete, glabrous, with an open basal sheath; ovary subcompletely 3-celled, with several ovules in each cell [2. *Juncus*](#)

1. LUZULA

DC., Fl. Fr., ed. 3, 3: 158 (1805); F.T.A. 8: 95 (1901). Nom. cons.

- 1 Roots fibrous; leaves in a basal rosette, linear-lanceolate to elongate-linear, acute, up to 20 cm. long and 5 mm. broad, about 7-nerved, ciliate when young, at length glabrous; inflorescence capitate or clusters of flowers pendunculate; leafy bracts subtending the inflorescence densely villous inside towards the base; floral bracts acutely acuminate, long-ciliate, as long as the perianth-segments, the latter very dark brown, acuminate; capsule ovoid-trigonous, mucronate, 2 mm. long [campestris var. mannii](#)

***Luzula campestris* (Linn.) DC.** Fl. Fr., ed. 3, 3: 161 (1805). *APD acc*

Widely distributed, principally in the N. Temperate Zone, with one variety in our area.

***Luzula campestris* var. *mannii* Buchenau** in Engl., Bot. Jahrb. 12: 159 (1890), and in Engl., Pflanzenr. 4, 36: 87 (190B); F.T.A. 8: 96; Hedberg in Symb. Bot. Ups. 25, 1: 63 (1957); Carter in Kew Bull. 19: 515 (1965).

APD: *Synonym of Luzula abyssinica Parl.*

APD: *Synonym of Luzula mannii (Buchenau) Kirschner & Cheek subsp. mannii*

APD: *Synonym of Luzula mannii subsp. gracilis (S. Carter) Kirschner & Cheek*

Small grass-like perennial; [in montane grassland.](#)

W. Cam.: Cam. Mt., 10,000–13,300 ft. (Dec., Jan.) Mann 2108! Johnston 48! Maitland 1248! Hinds C17! Morton GC 6904! **F. Po:** Clarence Peak, 7,000 ft. to summit (Apr.) Mann 658! 1162! Guinea 2868!

Also in [Congo \(Kivu\)](#) and [Uganda \(Mt. Elgon\)](#).

2. JUNCUS

Linn., Sp. Pl. 325 (1753); F.T.A. 8: 92 (1901).

- 1 Leaves about 3 cm. long in a basal rosette, linear-filiform, acute; flowers 4–8 in a pedunculate cluster; subtending bract subulate-linear, about 2 cm. long; floral bracts ovate, subulate-acuminate; perianth-segments acuminate, membranous, with recurved tips; stamens 3; capsule ovoid-trigonous, brown, much shorter than the perianth; seeds ellipsoid, not tailed [1. *capitatus*](#)
 Leaves about 30–40 cm. long, few, basal, terete, acute; stems terete, wiry, terminated by a cyme of small flowers subtended by a subulate terete leaf about 10 cm. long which expands into a membranous wing at the base about 3 cm. long; bracts lanceolate, chaffy, about 5 mm. long; perianth-segments lanceolate, acute, pale green; stamens 6; capsule as long as or longer than the perianth; seeds shortly tailed at one end [2. *rigidus*](#)

1. **Juncus capitatus** Weig. Obs. 28 (1772); F.T.A. 8: 95; Buchenau in Engl., Pflanzenr. 4, 36: 256 (1906).
APD acc

A small annual rush about 9 cm. high; **at high altitudes**.

W. Cam.: Cam. Mt., 7,000 ft. (fr. Dec.) Mann 2094!

Also in **Ethiopia**, **N. Africa**, **Atlantic islands** and **S. Europe**.

2. **Juncus rigidus** Desf. Fl. Atlant. 1: 312 (1798); Snogerup in Fl. Iranica 75: 4 (1971). *APD acc*

Juncus maritimus of F.T.A. 8: 93; F.W.T.A., ed. 1, 2: 484; Berhaut, Fl. Sén. ed. 2, 372.

A tufted perennial herb with inflorescences about 60 cm. high and very acute leaf apices; **in salt marshes and salt water pools by oases**.

Sen.: Cayor Leprieur! Tibeghun Chipp 94! Gandhiolle Heudelot 511! St. louis Berhaut 1351! Baibani Trochain 2352!

Salty places in the **Sahara**, **tropical and southern Africa** and **the Middle East**.

CYPERACEAE

Annuals or caespitose (tufted), rhizomatous, occasionally tuberiferous perennials (Microdracoides is pseudo-arborescent); underground stems bearing scales which grade into the culm leaves; culms generally leafy only at, or towards the base and generally unbranched below the inflorescence, solid, triquetrous, round, flattened or 5-angled; leaves with a distinct cylindrical sheath, closed (except in Coleochloa), generally without a ligule, prolonged at the apex on the side opposite the blade (antiligule) in species of Scleria and Afrotrilepis, and a generally linear blade (reduced to an apiculus in Eleocharis and elsewhere), not articulated with the sheath as in grasses, though deciduous in Coleochloa. Flowers small, simple, often consisting only of stamens or pistil or both within a subtending glume, sometimes with accompanying hypogynous bristles, hairs or squamellae, arranged in bisexual or unisexual (Microdracoides, Carex, some Sclerieae) spikelets. Spikelets sometimes solitary (always so in Eleocharis), more often aggregated into capitula, spikes or glomerules which in turn may be solitary or variously arranged, often in 1–3 times compound, unequally rayed umbels, subtended by 1-several, more or less leaf-like, bracts. Stamens 1-numerous, often 3, anthers basifixed with two pollen sacs often with sterile tips and crest, opening lengthwise by a slit, often protandrous. Ovary superior with one erect anatropous ovule, and generally 2–3 branched style. Fruit indehiscent, nut-like (achene) generally lenticular or trigonous. Seed erect with a small embryo and abundant mealy or fleshy endosperm.

A large family distributed throughout the world, mostly dominant in damp or marshy places, especially in temperate or cold regions.

KEY TO THE GENERA

- 1 Plants either male or female, with a trunk-like base and short lanceolate leaves set in a close spiral[23](#).
Microdracoides
- Plants bisexual:[2](#)
- 2 Flowers bisexual, enclosed by glumes, and arranged in two rows on the rachilla of the more or less distinctly flattened spikelet; usually all glumes above the prophyll fertile:[3](#)
- Flowers unisexual or bisexual in a rounded spikelet (sometimes flattened at the base but then with the lowest two glumes empty):[8](#)
- 3 Spikelets falling entire from the rachis at maturity, leaving the subtending bract and prophyll surrounding the rachilla scar, often very numerous, sessile and crowded on short rachides, generally composed of a small number of glumes :[4](#)
- Spikelets at maturity breaking into several pieces or remaining attached to the rachis whilst the lower mature glumes and achenes are shed, exposing the more or less deeply pitted rachillas, generally composed of a large number of glumes:[6](#)
- 4 Stigmas 3; achene more or less distinctly trigonous:[5](#)
- Stigmas 2; achene laterally (that is, in the plane of the rachilla) flattened; spikelets often composed of 2–3

- glumes folded within one another and maturing only 1–2 achenes [6. Kyllinga](#)
- 5 Spikelets numerous, clustered in a lobed Kyllinga-like head, each with a single achene partly sheathed in a thickened section of the rhachilla; plant with long creeping rhizomes [3. Remirea](#)
- Spikelets generally with 2 to several achenes, if one then this not sheathed in the thickened rhachilla, (sometimes glumes numerous and then distinguishable from Cyperus only at maturity) [2. Mariscus](#)
- 6 Rhachilla of spikelet breaking into segments on maturity, these composed of rhachilla, glume and achene [4. Torulinum](#)
- Rhachilla of spikelet remaining entire at maturity, often bare below due to loss of glumes and achenes: [7](#)
- 7 Stigmas 3, occasionally 2 or 1, achene usually trigonous [1. Cyperus](#)
- Stigmas 2, achene laterally flattened [5. Pycneus](#)
- 8 Flowers (at least some) bisexual with stamens and ovary within the same subtending glume: [9](#)
- Flowers unisexual, without ovary and stamens enclosed within the same glume: [18](#)
- 9 Spikelets of numerous flowers spirally arranged at least at the top of the spikelet, generally producing many achenes, only the lowermost 0–2 sterile: [10](#)
- Spikelets of few fertile flowers accompanied by 1–several empty glumes: [17](#)
- 10 Ovary and stamens enclosed in modified scale(s) (squame) within the glume: [11](#)
- Ovary and stamens not enclosed in modified scales: [12](#)
- 11 Ovary and stamens enclosed or enwrapped by a squamella more conspicuous than the subtending glume [13. Ascolepis](#)
- Ovary and stamens enclosed in two membranous squame) within the more conspicuous glume [14. Lipocarpha](#)
- 12 Achene with a terminal appendage (beak) formed by the thickened and persistent style base: [13](#)
- Achene without a distinct appendage at maturity: [15](#)
- 13 Plants without well developed leaf-blades, sheaths ending in a small point; flowering stems generally numerous and ending in a solitary spikelet, sometimes sterile; bristles often present round the ovary: [14](#)
- Plants with at least some leaves present; sheaths often with long hairs at the mouth and frequently long hairs also present at the base of the bracts [10. Bulbostylis](#)
- 14 Achene more or less truncate bearing a distinct style-base [8. Eleocharis](#)
- Style-base very small; submerged aquatic with numerous sterile stems in successive whorls [9. Websteria](#)
- 15 Base of the style not enlarged; bristles, at the base of achene, present or absent: [16](#)
- Base of the style enlarged but generally falling with the rest of the style; bristles absent [11. Fimbristylis](#)
- 16 Glumes hairy; laminate bristles often present [12. Fuirena](#)
- Glumes generally glabrous; bristles absent or simple [7. Scirpus](#)
- 17 Plants large with a branched inflorescence of many partial umbels and saw-like edges of the leaves; styles 3; achene narrower above but not with a distinct beak; rare [16. Cladium](#)
- Plants variable but without saw-like edges to the leaves and with a distinct beak on the achene; styles 2 [15. Rhynchospora](#)
- 18 Ovary completely enclosed in a flask-shaped utricle [24. Carex](#)
- Ovary not completely enclosed in a utricle: [19](#)
- 19 Ovary with a boat-shaped glume, generally ciliate on the keel, on either side, containing one stamen each; achene ovate or obovate, inflated or wrinkled in the upper part: [20](#)
- Ovary not accompanied by two boat-shaped laterally placed glumes: [21](#)
- 20 Inflorescence umbellate [18. Hypolytrum](#)
- Inflorescence capitate [17. Mapania](#)
- 21 Achene accompanied by numerous long bristles: [22](#)
- Achene not accompanied by numerous long bristles: [23](#)
- 22 Leaf-sheaths open on one side (as in grasses) with a ring of ligular hairs; blade deciduous [21. Coleochloa](#)
- Leaf-sheaths closed and prolonged at the mouth on the side opposite the blade [22. Afrotrilepis](#)
- 23 Achene with two 3-lobed glumes close beneath it [20. Diplacrum](#)
- Achene with a simple glume, sometimes with a 3-lobed disk or ciliate at its base [19. Scleria](#)

Linn., Sp. Pl. 44 (1753); F.T.A. 8: 310–377 (1901); Kükenthal in Engl., Pflanzenr., Cyperaceae—Scirpoideae—Cypereae 41–315 (1935–36).

Juncellus (*Griseb.*) *C.B.Cl.* in Hook. f., Fl. Brit. Ind. 6: 594 (1893); F.T.A. 8: 306 (1901); F.W.T.A., ed. 1, 489 (1936); Kükenthal in Engler l.c. 315–326.

- 1 Stems up to 2 m. high, leafless, pithy, rounded with transverse septa showing in the dry state as rings; bracts broadly lanceolate up to 1 cm. long; spikelets 10–25 × 1–1.25 mm., pale brownish, in short rounded spikes [7. articulatus](#)
Stems without transverse septa, even when dry: **2**
- 2 Rays of the inflorescence very numerous (50 or more), slender, equal, or almost so, often sterile; spikelets pale to golden brown in short cylindrical spikes [1. papyrus](#)
Rays of the inflorescence not very numerous and subequal: **3**
- 3 Spikelets arranged along the rhachis in more or less elongated spikes (to p. 282): **4**
Spikelets digitately or very shortly spicately arranged in a central sessile head, with or without additional unbranched, rayed spikes, or spikelets few, paired or solitary: **33**
- 4 Spikes cylindrical or oblong at least twice as long as wide; spikelets in flower not exceeding 1.5 cm. long: **5**
Spikes obovoid, hemispherical or fan-shaped: **16**
- 5 Spikelets very numerous and crowded together so as to obscure the rhachis: **6**
Spikelets not so numerous and crowded as to obscure the rhachis, often erecto-patent to erect: **10**
- 6 Spikelets and bracts erect or suberect at maturity: **7**
Spikelets spreading: **8**
- 7 Stem-bases swollen into a woody pseudobulb; glumes up to 1.5 mm. long [26a. tonkinensis var. baikiei](#)
Stem bases hardly thickened; sheaths yellow; glume 2 mm. long; rare [25. eleusinoides](#)
- 8 Glumes about 1 mm. long with a distinct green keel and recurved mucro; rays sometimes very short or absent; bracts 5–7 mm. wide [5. imbricatus](#)
Glumes with a short straight mucro; rays well-developed: **9**
- 9 Glumes with a broad rounded keel, margins inrolled at maturity to reveal the dorso-ventrally flattened, pale achene; stigmas and stamens generally 2 [6. alopecuroides](#)
Glumes with a narrow keel; spikelets golden, 3–5 mm. long, 10–14 flowered; stigmas 3; achene trigonous [4. dives](#)
- 10 Glumes black with a green keel [24. atroviridis](#)
Glumes straw-coloured, silvery, yellow or golden-brown: **11**
- 11 Annual; glumes broadly elliptical, obtuse with a membranous margin, golden-sided, nearly equalled by the elliptical flattened achene [28. iria](#)
Perennial; glumes longer than the achene: **12**
- 12 Spikelets narrow, less than 1 mm. wide, erecto-patent: **13**
Spikelets more than 1 mm. wide; glumes mucronate: **15**
- 13 Spikelets golden or brownish with a pale central stripe, almost terete; glumes acute and minutely apiculate 2. digitatus subsp. auricomus **14**
..... [@](#)
Spikelets uniformly golden-brown, flattened with a zigzag rhachilla; plant large, with inflorescence rays to 35 cm. long [23. koyaliensis](#)
- 14 Plants up to 1 m. high with leaves and bracts to 1.5 cm. wide; inflorescence umbellate; rays smooth [2a. digitatus subsp. auricomus var. auricomus](#)
Plants up to 3 m. high with leaves and bracts to 3 cm. wide; inflorescence bisumbellate; rays scabrid [2b. digitatus subsp. auricomus var. bruntii](#)
- 15 Glumes numerous, less than 2 mm. long with a clear green keel; rhachilla straight [3. exaltatus](#)
Glumes few, more than 2 mm. long, golden; rhachilla zigzag [19. permacer](#)
- 16 Base of the stem swollen and enclosed with the lower leaf-bases in hard, brown scales, often with bulbils in the leaf-axils surrounded by fibrous-edged scales; leaves numerous, clustered, nearly equalling stems; spikelets brown [15. bulbosus](#)
Base of the stem not enclosed in brown scales, swollen or not: **17**
- 17 Rhachis of the spike hairy and more or less flexuose; glumes with a conspicuous white membranous margin: **18**

- Rhachis of the spike not hairy: 20
- 18 Spikelets 3–5 mm. wide; rhachis of spike almost straight, often short; glumes about 3.5 mm. long [30. *incompressus*](#)
- Spikelets up to 3 mm. wide; plant with slender rhizomes, sometimes bearing tubers; stems sharply angled; rhachis of spike elongate, flexuose; bracts long acuminate: 19
- 19 Glumes straight at maturity; plant with slender rhizomes bearing tubers; leaves and bracts up to 8 mm. wide, gradually narrowed into a slender tip [9. *procerus*](#)
- Glumes arching away from the rhachilla at maturity; stems and sheaths tinged purple; leaves and bracts up to 18 mm. wide, suddenly narrowed into a slender tip [8. *latifolius*](#)
- 20 Plant bearing slender rhizomes ending in tubers: 21
- Plant rhizomatous or not but not bearing scaly tubers: 25
- 21 Rhizomes rather soft, with pale scales; tubers globular to ovoid, smooth or sometimes hairy when old; stems thickened in the lower part by numerous leaf-sheaths but not swollen; spikelets in short spikes, generally golden or yellowish, 1–2 cm. long, with an irregular outline at maturity; glumes obtuse. sides with raised nerves, only the margins nerveless and membranous [14. *esculentus*](#)
- Rhizomes somewhat woody with dark scales, soon becoming fibrous; tubers covered with dark fibres and persisting as hard swollen bases to the stems; spikelets often in fascicles; glumes with a wide nerveless side: 22
- 22 Spikelets red-brown to dark red-purple, glumes 2.5–4 mm. long: 23
- Spikelets pale brown or silvery; glumes 1.5–2 mm. long, numerous, closely and regularly imbricate: 24
- 23 Glumes elliptical, about 3 mm. long, keel somewhat incurved towards the subacute tip; spikelets about 2 mm. wide, acute [12. *rotundus*](#)
- Glumes lanceolate, about 4 mm. long, gradually narrowed to an acute, membranous, slightly recurved tip; spikelets 1–1.5 mm. wide with long, slender, sometimes flexuose tips [13. *tuberosus*](#)
- 24 Glumes 2 mm. long, obtuse, not spreading; spikes lax to dense spikeletted [11. *maculatus*](#)
- Glumes 1–1.5 mm. long, slightly spreading at the tip, obtuse and apiculate; spikes dense spikeletted [26a. *tonkinensis* var. *baikiei*](#)
- 25 Glumes, at least some, with a dark red-brown spot on the side near the base; plant caespitose; stem often yellow-green, at least when dry; rhachilla narrow, black, zig-zag [16. *sphacelatus*](#)
- Glumes without red-brown spots; stems not yellow-green below: 26
- 26 Spikelets narrow, less than 1.5 mm. wide: 27
- Spikelets 1.5 mm. wide or more: 29
- 27 Glumes less than 2 mm. long with obtuse tips; rhachilla internodes over 1 mm. long [22. *distans*](#)
- Glumes 2 mm. long or more; rhachilla internodes less than half the length of the glume: 28
- 28 Tips of the glumes mucronulate, sides with clear raised red nerves and broad pale membranous margins [27. *congensis*](#)
- Tips of the glumes obtuse to acute, nerves slender, obscure, margin narrowly membranous [10. *fenzelianus*](#)
- 29 Spikes with distant spikelets, the lower spreading or reflexed at maturity; plant with slender, about 2 mm. wide, curved rhizome; glumes pale with a pink or reddish tinge, the apex emarginate and shortly mucronate [17. *dilatatus*](#)
- Spikes with distant or clustered spikelets; erect or spreading at maturity; glumes yellow, golden or brown with green mid-rib: 30
- 30 Glumes very large (5 × 4 mm.), deltoid with spreading tips; plants up to 150 cm. high; stems smooth, sharply triangular [21. *baoulensis*](#)
- Glumes smaller (3–4 mm. long), ovate-lanceolate [18. *tenuiculmis*](#)
- @
- 31 Glumes clearly two coloured, streaked with dark brown on a golden background [18c. *tenuiculmis* var. *guineensis*](#)
- Glumes brown or golden, concolorous: 32
- 32 Glumes shortly mucronate [18a. *tenuiculmis* var. *tenuiculmis*](#)
- Glumes with a distinct mucro; stem below the inflorescence often scabrid [18b. *tenuiculmis* var. *schweinfurthianus*](#)
- 33 Plant with elliptical, dark green, white-or purple-veined leaves and bracts; rays stem-like, triangular or flattened, flexuose, longer than the stems, sometimes recurved and proliferating, bearing 1–4 oblong, flattened spikelets about 10 × 5 mm. [38. *fertilis*](#)
- Plant not having elliptical leaves and bracts and long stem-like rays: 34
- 34 Rayed spikes present: 35

- Rayed spikes normally absent, though 1 or 2 may occasionally be developed; spikelets normally sessile in a solitary head: 60
- 35 Spikelets large, at least 10 × 2.5 mm.: 36
- Spikelets small, less than 1 cm. long and 2.5 mm. wide, and numerous: 45
- 36 Achene flattened, lenticular or with one long and two short sides; spikelets broadly elliptical in section; glumes rounded on back with a broad green keel, falling to reveal a deep, narrow rhachilla: 37
- Achene trigonous, with equal sides: 41
- 37 Spikelets linear, obtuse; glumes pale, often spotted with dark colour and crossed by two raised lines on the sides; stigmas generally 2 [31. pustulatus](#)
- Spikelets lanceolate, acute; glumes golden or brown; stigmas 3: 38
- 38 Sides of glume almost nerveless, apex acute [32. podocarpus](#)
- Sides of glume finely nerved except for a membranous margin: 39
- 39 Glumes 4–5 mm. long, subobtusate and mucronulate [54. aucheri](#)
- Glumes 2.5–3.5 mm. long: 40
- 40 Spikelets strongly compressed; glumes purple-brown, acuminate [53. jeminicus](#)
- Spikelets subterete; glumes pale [52. conglomeratus](#)
- 41 Spikelet subquadrangular in section, greenish; bracts numerous, leafy, spreading; glumes apiculate [20. zollingeri](#)
- Spikelet flattened, narrowly elliptical to elliptical in section: 42
- 42 Glumes aristate, with a three-nerved keel and pale or chestnut-brown sides [49. cuspidatus](#)
- Glumes obtuse or apiculate: 43
- 43 Glumes with a sharp green keel prolonged into an apiculus: 44
- Glumes with a rounded keel and reflex membranous apex [30. incompressus](#)
- 44 Glumes lanceolate, not overlapping, persistent and spreading at achene fall, green or golden; achene narrowly elliptical, little shorter than the body of the glume [42. reduncus](#)
- Glumes ovate, overlapping, deciduous, pale or chestnut-brown; achene obovate or broadly elliptical, about half as long as the glume [29. compressus](#)
- 45 Large cultivated or escaped, leafless plants with a whorl of numerous subequal bracts, sometimes sterile or with spherical clusters of golden-brown spikelets [33. alternifolius](#)
- Plants not leafless and with many subequal bracts: 46
- 46 Glumes black or dark purple on the sides, elliptical with a short green recurved apiculus; inflorescence diffuse with lax secondary rays; achene slightly shorter than the glume [40. dichroostachyus](#)
- Glumes green or pale to dark brown: 47
- 47 Achene equalling the glume in length and exposed by the spreading of the glume at maturity: 48
- Achene shorter than the glumes and not exposed at maturity: 50
- 48 Inflorescence pseudolateral with an erect bract continuing the line of the stem; rays short, up to 5 cm. long; spikes spherical; glumes rounded on the back [43. submicrolepis](#)
- Inflorescence with several spreading or reflexed leafy bracts: 49
- 49 Glumes 0.5 mm. long, obovate, obtuse with a winged keel; spikelets ovate, flattened [41. difformis](#)
- Glumes 1.5 mm. long, broadly ovate, acute and shortly apiculate, keel not winged; spikelets linear, few-flowered, sometimes proliferating [37a. diffusus subsp. buchholzii](#)
- 50 Plant annual: 51
- Plant perennial: 55
- 51 Glumes reflex with a long recurved point from the three-nerved keel and pale or chestnut-brown sides [49. cuspidatus](#)
- Glumes apiculate, shortly pointed: 52
- 52 Spikelets narrowly linear, uniformly pale to deep golden-brown; glumes 1.0–1.25 mm. long [50. amabilis](#)
- Spikelets lanceolate or linear-elliptic, greenish white sometimes tinged with gold; glumes 1.5 mm. or more long: 53
- 53 Spikelets generally exceeding 2 mm. wide; glume with a sharp erect tip and nerved sides; achene broadly elliptical, sharply trigonous, almost smooth, more than half the length of the glume [29. compressus](#)
- Spikelets not exceeding 2 mm. wide; glumes with nerveless sides; achene globose, stipitate, punctulate, up to half as long as the glume: 54
- 54 Spikelets generally 2 or 3 together; glumes at maturity spreading, with a recurved mucro [45. tenuispica](#)

- Spikelets mostly solitary; glumes at maturity erect and deciduous [44. remotispicatus](#)
- 55** Bracts 6–10, up to 2.5 cm. wide; inflorescence diffuse with secondary and tertiary rays spreading or reflexed in fruit; spikes brown, hemispherical, 3.5–6 mm. across; glumes recurved, apiculate with clearly nerved sides, the lower ones spinulose-ciliate on the keel [36. renschii](#)
- Bracts 1–5: **56**
- 56** Plant with an elongated rhizome, 3-winged stems and bladeless or shortly bladed leaves; bracts 1–2, short, trigonous, the lower erect or nearly so; spikelets greenish, golden or pale brown; anthers 0.65–0.9 mm. long [47. denudatus](#)
- Plant caespitose or with a short rhizome, sometimes with well-developed leaves: **57**
- 57** Side of glume with several nerves; plants 90–150 cm. high with leafy stems; Spikelets red-brown; glumes lanceolate, tapering to a recurved apiculus [35. mannii](#)
- Side of glume with a single nerve; generally smaller plants: **58**
- 58** Leaves all basal, spreading, with hard red-brown sheaths and inrolled margins; inflorescence compact with rays up to only a few cm. long, bearing crowded spikelets; glumes shining, red-brown to nearly black [48. tenax](#)
- Leaves lax or wanting; rays well developed, bearing few-spikeletted spikes: **59**
- 59** Glumes 2.5–3.0 mm. long, lanceolate and apiculate [34. pseudoleptocladus](#)
- Glumes 1.5–2.0 mm. long, acute and cuspidate [46. haspan](#)
- 60** Style simple, without stigmatic branches; slender plants, stems generally not exceeding 25 cm. with a tiny, pseudo-bulbous base; achene turbinate: **61**
- Style with two or three branches: **63**
- 61** Spikelets broadly elliptical 4–6 mm. long in a compact head, brownish at maturity; achene about 0.5 mm. long [64. meeboldii](#)
- Spikelets narrowly elliptical or lanceolate 8–18 mm. long in a terminal or pseudo-lateral cluster, pale even at maturity; achene about 1 mm. long: **62**
- 62** Spikelets narrowly elliptical, radiating; sides of the glumes without nerves; achene with rounded angles [63. clavinux](#)
- Spikelets lanceolate, erect or curved upwards; glumes nerved on the sides; achene with acute angles [65. lateriticus](#)
- 63** Leaves reduced to bladeless sheaths; spikelets few, large, about 15 × 5 mm., ovate with numerous overlapping, acuminate glumes [62. nudicaulis](#)
- Leaves, at least some, with blades: **64**
- 64** Inflorescence of few, white, turgid, subacute spikelets in a pseudolateral cluster, subtended by an erect, stem-like bract [67. laevigatus](#)
- Inflorescence not pseudolateral: **65**
- 65** Plant perennial with knotted, fibre-covered rhizome, purple sheaths and a head of large, whitish spikelets [39. mapanioides](#)
- Plant annual or perennial without knotted, fibre-covered rhizomes: **66**
- 66** Spikelets small, up to 5 × 1.5 mm., congested in a Kyllinga-like head; plant slender: **67**
- Spikelets 2 mm. or more wide, few and digitate, or if numerous and congested then plants robust: **68**
- 67** Inflorescence surrounded by conspicuous, leafy bracts with widened whitish bases; glumes subdistichously arranged, overlapping, with a green apiculus; achene flattened [66a. michelianus subsp. pygmaeus](#)
- Inflorescence bracts scarcely widened at the base; glumes distichous, not overlapping, obtuse, pale; achene trigonous [55. pulchellus](#)
- 68** Stems about 1 mm. wide, not or scarcely thickened at the base; plant annual; glumes green or golden with a green, spreading acumen [29. compressus](#)
- Stems either more than 1 mm. wide or markedly thickened and pseudo-bulbous at the base, often surrounded by the remains of old leaf-sheaths: **69**
- 69** Stems robust, leafy but not pseudobulbous at the base; leaves flat, coriaceous: **70**
- Stems pseudobulbous at the base, thickened by the remains of old leaf-sheaths: **71**
- 70** Inflorescence hemispherical, up to 2 cm. across; lowermost leaves represented by acute scales, gradually lengthening into blades up the stem; bracts short, spreading, rigid [56. angolensis](#)
- Inflorescence globose or subglobose, 3–5 cm. across; lower leaf-blades not gradually reduced; bracts long, reflexed [51. maritimus](#)
- 71** Glumes lanceolate, 6–8 mm. long, white; robust creeping plants up to 90 cm. high; leaves about 4 mm. wide; bracts spreading; spikelets much flattened, somewhat confluent [61. ledermannii](#)

Glumes ovate or broadly ovate with a boat-shaped tip, white, yellow or pink; spikelets little flattened, discrete:

- 72
- 72 Robust plants with few, large, yellowish spikelets up to 4.5×1 cm.; leaves up to 6 mm. wide [57. *karlschumannii*](#)
Plants of moderate size with several whitish or pinkish spikelets up to 30×8 mm.: 73
- 73 Rhizome composed of a series of contiguous, short, swollen stem-bases clad in membranous sheaths; leaves flat, up to 4 mm. wide; spikelets at maturity oblong, $15-30 \times 6-8$ mm., flattened; glumes boat-shaped, spreading, shining white with green keel [58. *margaritaceus*](#)
Stem-bases elongated, flask-shaped, clad in hard remains of leaf-sheaths; leaves capillary, up to 1 mm. wide; spikelets at maturity broadly ovate, $6-12$ cm. \times $5-7$ mm.: 71
- 74 Bracts 3-5, several times longer than the spikelets [60. *tisserantii*](#)
Bracts 0-3, shorter to slightly longer than the spikelets [59. *nduru*](#)

1. **Cyperus papyrus** *Linn.* Sp. Pl. 47 (1753); F.T.A. 8: 374; Kük. in Engl., Pflanzenr. Cyper. 45 (1935); Berhaut, Fl. Sén. ed. 2, 379 (1967). *APD acc*

APD: *Synonym of Cyperus koyaliensis Cherm.*

Cyperus papyrus subsp. **antiquorum** (*Willd.*) *Chiov.* in Mém. R. Instit. Bot. Modena 1: 73, t. 2 (1931); Kük. l.c. 47.

Stems spongy, up to 5 m. high with characteristic mop-like inflorescences of very numerous primary, often sterile rays; **forming rafts in open water and fringing lakes.**

Sen.: Dakar Berhaut 1399! **Dah.:** Porto-Novo (Jan.) Chev. 22714! **N. Nig.:** Maiduguri (Mar.) Tuley 1116! Baga Seyoram, L. Chad (Oct.) Golding 23! **S. Nig.:** Lagos Barter 2153! Ejirin (Apr.) Ejiofor & Horne FHI 29400! Epe (Feb.) Onochie FHI 20690!

Also reported by Kükenthal from Guin. and Iv. C. and from Lib. by Dinklage; throughout tropical and S. Africa and Madagascar and cultivated elsewhere.

2. **Cyperus digitatus** *Roxb.* Hort. Beng. 81 (1814), and FL Ind. 1: 209 (1820); F.T.A. 8: 372; Kük. l.c. 55. *APD acc*

The typical subspecies occurs in Eastern Asia, and central and S. America.

Cyperus digitatus subsp. **auricomus** (*Spreng.*) *Kük.* in Bot. Notis. 1834: 65 (1934). *APD acc*

- 2a. **Cyperus digitatus** subsp. **auricomus** var. **auricomus**. *APD acc*

Cyperus auricomus *Sieb. ex Spreng.*, Syst. 1: 230 (1824); F.T.A. 8: 373; F.W.T.A., ed. 1, 2: 483; Cherm. in Arch. Bot. Caen 7, Mém. 4: 16 (1936); Berhaut, Fl. Sén. ed. 2, 382 (1967).

Characterized by the lax-spikeletted, cylindrical, digitately-arranged spikes of spreading spikelets with a central golden stripe; **shallow water and swamps.**

(June) Keay FHI 25902! Sherifuri, Bauchi Dist. (May) Thornewill 164!

Throughout tropical Africa and in **Egypt** and **S. Africa**.

The typical subspecies occurs in eastern Asia, and central and S. America.

- 2b. **Cyperus digitatus** subsp. **auricomus** var. **bruntii** *Hooper* in Kew Bull. 26: 577 (1972). *APD acc*

Similar to the preceding variety in spikelet structure but larger in all its parts with stems up to 3 m. high, leaves and bracts up to 3 cm. wide and a bisumbellate inflorescence.

N. Nig.: Ibaji Ojoko F.K., Kabba (May) Latilo FHI 47653! **W. Cam.:** Babungo, Ndop Plain, 3,800 ft. (June) Brunt 1146!

3. *Cyperus exaltatus* Retz. Obs. 5: 11 (1789); F.T.A. 8: 370; Kük. l.c. 64. *APD acc*

Cyperus dives of F.W.T.A., ed. 1: 483.

Robust plant up to 1·6 m. high, with obtuse, cylindrical, lax-spikeletted, golden, rayed spikes; *near open water*.

Sen.: Ourosagui to Matam (Dec.) Naegelé 13183! **iv. C.:** Téhini (Aug.) de Wilde 781! Ferkessédougou (May) Aké Assi 4798! Marabadiassa to Gottoro (July) Chev. 22026! **U. Pantropical.

4. *Cyperus dives* Del. Descr. Egypte Hist. Sat. 2: 5, t. 4 fig. 3 (1813); Kük. l.c. 68; Cherm. in Arch. Bot. Caen 7, Mém. 4: 17 (1936); Berhaut, Fl. Sén. ed. 2, 382 (1967). *APD acc*

Cyperus exaltatus var. *dives* (Del.) C.B. Cl. in J. Linn. Soc. 21: 187 (1884); F.T.A. 8: 370.

Distinguished from *C. exaltatus* Retz. by the shorter, congested spikelets and from *C. alopecuroides* by the keeled glumes and three-sided achene; *marshes*.

Sen.: Mboro (Apr.) Leprieur! Sangalkam (July) Pitot! Kayar (Dec.) Pitot! Tivaouane (Apr.) Trochain 3110! Sangako, nr. Toubacouta (Oct.) Monad 8566!

Throughout tropical Africa, in *Madagascar* and in *Egypt* and *the near East*.

5. *Cyperus imbricatus* Retz. Observ. 5: 12 (1789); Kük. l.c. 69; Nelves & Baldwin in Amer. J. Bot. 39: 379 (1962); Berhaut, Fl. Sén. ed. 2, 383 (1967). *APD acc*

Cyperus radiatus Vahl, Enum. Pl. 2: 369 (1806); F.T.A. 8: 369; Cherm. in Arch. Bot. Caen 7, Mém. 4: 16 (1936).

Cyperus imbricatus var. *capitatus* (Boeck.) Kük. l.c. 70; Berhaut l.c. 383.

Plant to 120 cm. high and generally less robust than *C. exaltatus* Retz. with dense-spikeletted, cylindrical spikes in digitate clusters; *edge of open water*.

Anara F.R., Zaria Prov. (July) Clayton 1227! 1258!

Also in **central** and **northeast tropical Africa**.

[Very variable in size, having a depauperate form with one to a few spikelets similar to the var. *debilis* of the previous species from which it can be distinguished by the much more acute, often curved, spikelets.]

33. *Cyperus alternifolius* Linn. Mant. 2: 28 (1771).

APD: *Synonym of Cyperus involucratus Rottb.*

Cyperus flabelliformis Rottb., Descr. et Icon. 42, t.12 f.2 (1773); F.T.A. 8: 336.

Robust, leafless, triangular stems to 2 m. high with numerous, leafy bracts and subequal rays bearing clusters of elliptical, acute, shining brown spikelets; **cultivated**.

Sen.: Dakar (Apr.) Adam 1113! 1114! **S. L.:** Njala (Nov.) Deighton 3785! **Ghana:** Achimota (Mar.) Akpabla 2007! Aburi (Apr.) Irvine 2041! **W. Cam.:** Mouth of Limba R. (Mar.) Brunt 1041!

Introduced; native in Madagascar, east tropical and S. Africa and introduced in other parts of the tropics.

34. **Cyperus pseudoleptocladus** *Kük.* in Fedde, Rep. 29: 196 (1931). *APD acc*

Cyperus deckenii of F.T.A. 8: 342 partly, not of Boeck.

Similar to *C. haspan* L. but with somewhat longer, darker spikelets with longer apiculate glumes; near water.

W. Cam.: Musake, Buea, 6,000 ft. (Nov.) Migeod 127! L. Bambuluwe to Bamuko (July) Daramola FHI 41582! Pinyin, 5,500 ft. (Apr.) Brunt 1097!

Also in **east tropical Africa**.

35. **Cyperus mannii** *C.B. Cl.* in F.T.A. 8: 341 (1901). *APD acc*

Cyperus baronii *ar. mannii* (*C.B. Cl.*) *Kük.* in Engl., Pflanzenr. Cyper. 202 (1936).

Leafy perennial to 150 cm. high with an irregular, thrice-branched umbel bearing small clusters of brown spikelets, with paler, less clearly apiculate glumes and fewer bracts than the preceding species; **montane forest**.

S. L.: Bintumane Peak, Loma Mts. (Oct.–Jan.) T. S. Jones 97! 131! Jaeger 306! 495! Da-Oulen Peak, Loma Mts. (Aug.) Jaeger 1346! **Lib.:** Nimba Mts. (Dec.) Adam 20077! **N. Throughout tropical Africa.

37. **Cyperus diffusus** *Vahl* Enum. Pl. 2: 321 (1806).

APD: *Synonym of Cyperus laxus Lam. subsp. laxus*

The typical subspecies occurs in India and south-east Asia.

37a. **Cyperus diffusus subsp. buchholzii** (*Boeck.*) *Kük.* in Engl., Pflanzenr. Cyper. 210 (1936).

APD: *Synonym of Cyperus laxus subsp. buchholzii (Boeckeler) Lye*

Cyperus buchholzii *Boeck.*, Beitr. Kenntn. Cyper. 1: 3 (1883).

Cyperus diffusus of F.T.A. 8: 343; F.W.T.A., ed. 1, 2: 483.

Leafy, caespitose perennial 25–50 cm. high with purple leaf-sheaths, 4–8 leafy bracts and a 2–3 times umbellate inflorescence with small clusters of few-flowered spikelets with spreading glumes; **path sides and other openings in forest**.

Guin.: Kindia Jac.-Fél. 144! Benty (June) Chillou 2652! Macenta (Apr.) Pitot! Ziam (Apr.) Adam 4790! Nimba (Dec.) Adam 7374! **S. L.:** Koinadugu Dist. (Aug.) Haswell 203! Rokupr (Sept.) Jordan 313! Tropical Africa, Madagascar and S. Africa.

[Most West African specimens correspond to the var. *crassipes* (Vahl) C.B. Cl., having a large capitate inflorescence.]

52. **Cyperus conglomeratus** Rottb. Descr. Pl. Nov. Programm. 16 (1772), and Descr. et Icon. 21, t. 15 f. 7 (1773); F.T.A. 8: 324, partly; F.W.T.A., ed. 1, 2: 482, partly; Kük. l.c. 272, t. 30. **APD acc**

Cyperus adansonii C.B. Cl. (1895)—F.T.A. 8: 335.

Tufted plant with woolly roots, pale, papery leaf sheaths, stiff leaves and bracts and spherical clusters of generally pale spikelets; **sandy places**.

Maur.: Rosso (Oct.) Adam 19375! Oujat, E. of Aratane (Aug.) Rossetti 61/229! **Sen.**: Adanson! L. Tanma (Jan.) Pitot! Dakar Adam 14889! **Mali**: Timbuktu (July) Chev. 1235! Kabarah to Day (Aug.) Chev. 1346! Hombori (Feb.) Aké Assi 11476!

Extending through north-east Africa, and the Near East to India.

53. **Cyperus jeminicus** Rottb. Descr. Pl. Nov. Programm. 24 (1772). **APD acc**

Cyperus conglomeratus var. **multiculmis** (Boeck.) Kük. in Engl., Pflanzenr. Cyper. 274, incl. f. excisus (Boeck.) Kük. (1936).

Cyperus cruentus var. **excisus** C.B. Cl. in F.T.A. 8: 325 (1901); Cherm. in Arch. Bot. Caen 7, Mém. 4: 9 (1936).

Cyperus effusus of F.W.T.A., ed. 1, 2: 482; Berhaut, Fl. Sén. ed. 2, 376 (1967).

Tufted plant with narrow wiry roots, glaucous leaves, varying in width, and digitate clusters of spikelets about 3 cm. across; glumes lanceolate, acute with a recurved mucro becoming purple-brown; **sandy places**.

Maur.: Mederdra to Tiguent (Oct.) Adam 19350! Rkiz (Oct.) Adam 19323! **Sen.**: Heudelot 517! St. Louis to Thiés (Aug.) J. & A. Raynal 6271! Leybar, St. Louis (Oct.) Adam 19209! Malika (Aug.) Broadbent 33! **Niger**: Toukounous, Filingué Bartha 59!

Also in **north-east Africa** and **Arabia**.

54. **Cyperus aucheri** Jaub. & Spach Ill. Pl. Orient 2: 1, t. 101 (1844).

APD: *Synonym of Cyperus conglomeratus Rottb.*

Cyperus conglomeratus var. **aucheri** (Jaub. & Spach) C.B. Cl. in Dur. et Schinz, Consp. Fl. Afr. 5: 554 (1895); F.W.T.A., ed. 1, 2: 482.

Similar to *C. conglomeratus* Rottb. in habit but with a broader spikelet and winged achene; **sandy places**.

Niger: Agadem E. Vogel!

[The relationship between this specimen and typical examples of the species from the Persian Gulf requires further study.]

55. *Cyperus pulchellus* R. Br. Prodr. Fl. Nov. Holland 213 (1810); Kern in Reinwardtia 3: 39–46, fig. 5 (1954). *APD acc*

Cyperus leucocephalus of F.T.A. 8: 323; F.W.T.A., ed. 1, 2: 481; Cherm. in Arch. Bot. Caen 7, Mém. 4: 9 (1936); Azancot de Meneses in Garcia de Orta 4: 559 (1956); not of Retz. (1789).

Slender herb up to 40 cm. high from a fibrously thickened base, with a white, rounded head of numerous, small spikelets; **damp places**.

Sen.: Somone (Aug.) Leprieur! Kaolack (Sept.) Berhaut 2684! Tambacounda (Sept.) Berhaut 3270! Guermalale (Sept.) Trochain 4494! Ouassadou (Sept.) Berhaut 1814! **Gam.:** (Aug.) Ruxton 147! Also in **E. Cameroun**.

61. *Cyperus ledermannii* (Kük.) Hooper in Kew Bull. 26: 578 (1972).

*APD: Synonym of *Cyperus niveus* var. *ledermannii* (Kük.) Lye*

Cyperus obtusiflorus var. *ledermannii* Kük. in Engl., Pflanzenr. Cyper. 287 (1936).

Cyperus compactus of F.T.A. 8: 319, partly.

Cyperus obtusiflorus of F.W.T.A., ed. 1, 2: 481.

Perennial 30–90 cm. high with clustered stem-bases thickened by leaf-sheaths and a head of numerous large, flattened, pinkish-white, congested spikelets of numerous long, narrow, folded glumes; **savanna or open woodland.**

Dah.: Atacora Mt. Chev. 24140! **N. Nig.:** Kaduna to Jos (May) Clayton 1034! Anara F.R., Zaria Prov. (May) Keay FHI 22958! Samaru, Zaria Prov. (July) C. B. Taylor 18! Jog Plateau (May) Lely 291! Panshanu, Bauchi Prov. (Aug.) Lawlor & Hall 383!

Also in **E. Cameroun** and **? east tropical Africa**.

62. *Cyperus nudicaulis* Poir. in Lam., Encycl. 7: 240 (1806); F.T.A. 8: 316; C.B. Cl., Ill. Cyper. t. 7 (1909); Kük. l.c. 291; Cherm. in Arch. Bot. Caen 7, Mém. 4: 7 (1936).

*APD: Synonym of *Cyperus pectinatus* Vahl*

*APD: Synonym of *Anosporum pectinatus* (Vahl) Lye*

Tufted perennial with slender, leafless stems and a capitate inflorescence of few, broad, lanceolate spikelets of numerous, closely imbricated, yellow-green to brown glumes, sometimes proliferating; floating in mats, on mud or in swamps.

Cam.:** Baba, Ndop Plain (Mar.) Brunt 125!

Also in **central Africa** and **east tropical Africa** and in **Madagascar**.

63. **Cyperus clavinus** C.B. Cl. in F.T.A. 8: 319 (1901); Kük. l.c. 304; J. Raynal in Adansonia, sér. 2, 6: 306 (1966). *APD acc*

Cyperus monostigma C.B. Cl. in Mém. Soc. Bot. Fr. 2, 8: 26 (1907); Kük. l.c. 281.

Cyperus meeboldii var. *gigas* Berhaut in Bull. Soc. Bot. Fr. 100: 174 (1963).

Similar to *C. meeboldii* Kük. but with fewer, larger, pale spikelets in the head; seasonally damp sandy ground.

N. Nig.: Bornu T. Vogel 64! 65!

Also in **Chad**, and **south east Africa**.

64. **Cyperus meeboldii** Kük. in Fedde, Rep. 18: 345 (1922); Cherm. in Arch. Bot. Caen 7, Mém. 4: 11 (1936); Berhaut, Fl. Sén. ed. 2, 375 (1967); J. Raynal in Adansonia, sér. 2, 6: 304 (1966). *APD acc*

Slender leafy plants with slightly swollen stem-bases and heads about 1 cm. across, of broadly elliptical spikelets, brown when ripe; achene turbinate; clayey soils at edge of temporary water.

Sen.: St. Louis (Sept.) Trochain 4712b! Ndiakher, nr. St. Louis (Aug.) J. & A. Raynal 6296! Ouassadou (Nov.) Berhaut 1584! Rhaddar, nr. Linguère (Nov.) Adam 12353! **Niger:** Toukounous Bartha 89a!

Also in **Chad**, **Kenya**, **Tanzania** and **peninsular India**.

65. **Cyperus lateriticus** J. Raynal in Adansonia, sér. 2, 6: 308 (1966). *APD acc*

Plant of similar size and habit to *C. meeboldii* but with the inflorescence a pseudolateral cluster of pale lanceolate spikes, similar to those of *Juncellus laevigatus*; edge of temporary water.

Sen.: Maël, nr. Tambacounda (Sept.) Berhaut 1722!

Perhaps overlooked elsewhere.

66. **Cyperus michelianus** (Linn.) Link Hort. Bot. Berol. 1: 303 (1827). *APD acc*

- 66a. **Cyperus michelianus** subsp. *pygmaeus* (Rottb.) Aschers & Graebn. Synops. Mitteleur. Fl. 2, 2: 273 (1904); Kük. l.c. 312. *APD acc*

Cyperus pygmaeus Rottb., Descr. et Icon. 20, t. 14, fig. 5 (1773); Cherm. in Arch. Bot. Caen 7, Mém. 4: 11 (1936).

Juncellus pygmaeus (Rottb.) C.B. Cl. in Hook., Fl. Brit. Ind. 6: 596 (1893); F.T.A. 8: 308; F.W.T.A., ed. 1, 2: 489.

Scirpus occultus C.B. Cl. in Mém. Soc. Bot. Fr. 2, 8: 28 (1907).

Tufted annual 2–25 cm. high with conspicuous leafy bracts and a dense Kyllinga-like head of small whitish-green spikelets; muddy margins of watercourses.

Sen.: R. Senegal at Boki Diavé Trochain 2880! Tamboukané (Dec.) Chev. 2443! Ourosogui to Matam (Dec., Feb.) Naegelé 12127! Matam (Nov.) Berhaut 1414! Throughout tropical and subtropical regions.

Insufficiently known, doubtful and excluded species

***Cyperus bulamensis* Steud.** Syn. Pl. Glum. 2: 19 (1855); F.T.A. 8: 375; Kük. l.c. 136.

Portuguese Guinea, Bulama Islands

Collector?

***Cyperus callistus* Ridl.**

Reported from Dahomey (Newton 10) by Kükenthal is perhaps *C. esculentus* Linn.

***Cyperus cancellatus* Ridl.**

Is an Angolan species of the *C. haspan* Linn. alliance not recorded from West Africa, other than by a Maitland specimen reputedly from W. Cameroon, with few obtuse oblong-elliptic spikelets $4-7 \times 1.5-2.0$ mm., borne 1-4 together on a slender plant.

***Cyperus corymbosus* Rottb.**

Reported from Togo (Kersting 440) by Kükenthal, is perhaps *C. fenzelianus* Steud.

***Cyperus foliaceus* C.B. Cl.**

Warnecke 388 is given by Clarke as from Togo, but as from Kenya by Kükenthal.

***Cyperus glaber* Linn.**

Kükenthal cites a specimen of Afzelius from Sierra Leone, but this southern European and western Asiatic species does not seem to have been collected subsequently.

***Cyperus hamulosus* M. Bieb.**

See *Mariscus hamulosus*

***Cyperus* sp.**

Sierra Leone, Sefadu (Dec.) Deighton 3574! Belongs to the *C. tenuiculmis* group of species with a narrow sinuous rhachilla and subquadrangular spikelets up to 4 cm. long.

2. MARISCUS

Vahl, Enum. Pl. 2: 372 (1806), nom. cons.

Mariscus Gaertn. (1788)—F.T.A. 8: 377 (1901); F.W.T.A., ed. 1, 2: 485.

Cyperus subgen. *Mariscus* (Gaertn.) C.B. Cl. (1884)—Kükenthal in Engl., Pflanzenr. Cyperaceae—Scirpoideae—Cypereae 402 (1936).

- 1** Annual or slender caespitose perennial; glumes aristate or clearly apiculate:**2**
 Perennial; glumes acute or acuminate;**4**

- 2 Annuals with a spicy smell; glumes aristate:3
Slender perennial; spikelets terete or angular with few, obtuse, clearly apiculate glumes3. [soyauxii](#)
- 3 Spikelets flattened with many glumes, aristas long, recurved1. [squammosus](#)
Spikelets subspiral with few glumes2. [hamulosus](#)
- 4 Robust caespitose plant; stem bases thickened with numerous leaf-sheaths; leaves glaucous, stiff, septate-nodulose (when dry) with denticulate cutting edges; primary rays thick, bearing ovoid or shortly cylindrical spikes in a pyramidal cluster; spikelets terete, reddish, about 5×2 mm.4. [ligularis](#)
Plant slender or robust; leaves smooth to slightly scabrid on the margins:5
- 5 Plant rhizomatous; rhizome horizontal, about 8 mm. across, covered with purple to black scales; stems leafless, winged, up to 120 cm. high; inflorescence bisumbellate, rather strict; glumes spreading at maturity5. [socialis](#)
Plant caespitose or shortly rhizomatous with stems leafy below:6
- 6 Stems clavately thickened with papery white, later brown, fibrous sheaths; inflorescence capitate; head oblong or hemispherical; spikelets about 5 mm. long6. [dubius](#)
Stem-bases not clavately thickened; sheaths herbaceous or coriaceous, green or purple:7
- 7 Leaf-bearing portion of the stem elongated, woody, sometimes branched; leaves firm, septate-nodulose beneath (dry); inflorescence rays bearing a single cylindrical greenish-white spike, up to 6×2 cm. ... 7. [tomaiohyllus](#)
Leaves basal; stem above ground not woody and branched; inflorescence not simply umbellate with very large cylindrical spikes:8
- 8 Inflorescence up to 35 cm. across, either forming a compound umbel with secondary rays, or primary rays bearing clustered or distinctly branched spikes:9
Inflorescence capitate or simply umbellate with rays bearing simple or occasionally shortly branched spikes; spikelets not exceeding 1.5 cm. long:11
- 9 Inflorescence spreading; spikelets 2–3 cm. long when mature, remote and patent; glumes rounded on the back with a broad keel; rhachilla becoming thickened and breaking into segments with one achene ([see Torulinum odoratum](#))
Inflorescence and spikelets smaller; glumes more or less distinctly keeled; rhachilla not breaking into pieces: 10
- 10 Spikelets pale to red-brown8. [longibracteatus](#)
Spikelets dark red-brown to black9. [keniensis](#)
- 11 Spikelets 10–15 mm. long, linear with slender acute tips which become curved or sinuous as the spikelet matures:12
Spikelets not exceeding 5 mm. long, more or less terete, one or sometimes 2–3-flowered13. [alternifolius](#)
- 12 Glumes 2.4–2.8 mm. long; achene 1.4–1.85 mm. long:13
Glumes 3.4–4.5 mm. long; achene 1.9–2.6 mm. long:14
- 13 Spikes cylindrical or oblong, spikelets remote10a. [flabelliformis](#) var. [flabelliformis](#)
Spikes ovoid, about 1.5 cm. across10b. [flabelliformis](#) var. [aximensis](#)
- 14 Leaves and bracts up to 4.5–5.5 mm. broad, leaf-sheaths papery; rays up to 11 cm. long; spikes cylindrical; spikelets pale with green keel; glume tips spreading in fruit (W. Cam.)11. [foliosus](#)
Leaves and bracts 2.5–3.5 mm. broad; rays up to 2.5 cm. long; spikes hemispherical; spikelets crowded, reddish or golden with green keel; glume tips appressed even in fruit12. [luridus](#)

1. **Mariscus squarrosus** (Linn.) C.B. Cl. in Hook. f., Fl. Brit. Ind. 6: 623 (1893), as to name only.

APD: *Synonym of Cyperus squarrosus L.*

APD: *Synonym of Mariscus maderaspatanus (Willd.) Napper*

Cyepus squarrosus Linn., Cent. Pl. 2, 6 (1756); Kern in Blumea 10: 642 (1960).

Mariscus aristatus (Rottb.) Cherm. in Bull. Soc. Bot. Fr. 85: 366 (1938).

Cyperus aristatus Rottb., Descr. et Icon. 23, t. 6 fig. 1 (1773); F.T.A. 8: 348; F.W.T.A., ed. 1, 2: 483; Kük. in Kngl., Pflanzenr. Cyper. 502 (1936).

C. aristatus var. **semiglobosus** Kük. l.c. 504; Cherm. in Arch. Bot. Caen 7, Mém. 4: 12 (1936).

Annual weed with golden or reddish hemispherical or ovoid spikes and soft leaves; widespread in open ground.

Throughout tropical Africa.

[The West African material has a distinctive appearance due to the possession of a long, thick, often branched leafy aerial portion of the stem generally absent in East African material; further study is needed to prove whether it forms a distinct taxon.]

8. *Mariscus longibracteatus* Cherm. in Bull. Mus. Hist. Nat. Paris 25: 407 (1919). *APD acc*

Cyperus longibracteatus (Cherm.) Kük. in Fedde, Rep. 26: 250 (1929); Kük. in Engl., Pflanzenr. Cyper. 413 (1936).

Cyperus distans of F.T.A. 8: 349 partly, not of Linn. f.

Tufted plant up to 120 cm. high with a spreading inflorescence similar to that of *Cyperus distans* Linn. f. which is laxer with flexuose spikelets shedding their glumes; and to *Torulinium odoratum* (Linn.) Hooper which is a more robust plant with mucronate tipped glumes and the rhachilla breaking into segments when ripe; *swampy ground*.

Pantropical.

[Very variable in the size of the spikes, length of rays and crowding of the spikelets; a common form with subglobose or shortly obovoid spikes was described as var. *subglobosus* Kük. but is not clearly separable from specimens with laxer more cylindrical spikes (var. *thomensis* (C.B. Cl.) Kük.) which in turn run into the large form with more or less branched spikes described as *M. nossibeensis* Steud.]

Imperfectly known species

Mariscus sp. A *APD acc*

A robust plant 120 cm. high with flattened golden-brown spikelets, 10–16 × 1.25 mm., in cylindrical spikes on rays up to 12 cm. long; resembling *Mariscus congestus* Vahl but with a more expanded inflorescence and also to be compared, when better known, with *Mariscus strigosus* (Linn.) C.B. Cl. from N., central, and east S. America.

S. L.: Koinadugu, Northern Prov. (Aug.) Haswell 245!

Mariscus sp. B *APD acc*

Plant resembling *Mariscus alternifolius* Vahl but differing in the slender rhizomes covered with dark, eventually fibrous, scales, and the broadly elliptical, equal-sided achene.

Gam.: ?Kuntaur (July) Ruxton 45!

Mariscus sp. C *APD acc*

A slender species about 25 cm. high, with a short, swollen rhizome and distinctive whitish, Kyllinga-like head of 1-flowered spikelets; **in upland grassland.**

N. Nig.: nr. radio masts, Shere Mts., 5,000–5,500 ft. (July) J. Hall 1940!

3. REMIREA

Aubl., Hist. Pl. Guian. Fr. 1: 44 (1775); F.T.A. 8: 485 (1902).

- 1 Rhizome slender, branched, long-creeping; shoots short, with a cluster of lanceolate, stiff, spreading, harsh leaves, and a terminal, nearly sessile head of one to several sessile spikes surrounded by leaf-like bracts; spikelets with 3 or 4 sterile and one fertile glume; achene when ripe surrounded by a corky sheath formed from the apex of the rhachilla [maritima](#)

Remirea maritima *Aubl.* Hist. Pl. Guian. Fr. 1: 45, t. 16 (1775); F.T.A. 8: 486. *APD acc*

Cyperus pedunculatus (*R. Br.*) Kern in Acta Bot. 7: 798 (1958).

Strand plant with shoots arising singly or in small clusters from a long rhizome; **sandy places.**

Pantropical; particularly New World.

5. PYCREUS

P. Beauv., Fl. Oware 2: 48, (1816); F.T.A. 8: 288 (1901).

Cyperus subgen. Pycreus (*P. Beauv.*) C.B.Cl.—Kükenthal in Engl., Pflanzenr. Cyperaceae—Scirpoideae—Cypereae 326 (1936).

- 1 Aquatic or semi-aquatic plants growing in, or at the edge of, open water: **2**
Land plants, not normally submerged or floating: **6**
- 2 Weak creeping or floating plants with slender steins and leaves and few spikelets: **3**
Stout semi-aquatic plants more or less decumbent at the base but with robust stems up to 4 mm. across, thickened by yellowish leaf sheaths below; inflorescence an umbel of spreading subequal rays bearing short spikes of red-brown spikelets; glumes obtuse and boat-shaped at the apex: **5**
- 3 Inflorescence with rays: **4**
Inflorescence of 1–2 sessile spikelets [3. felicitis](#)
- 4 Spikelets borne singly on the rays of the inflorescence, pale [1. waillyi](#)
Spikelets 2–5 on each ray, brown or tinged brown [2. demangei](#)
- 5 Leaves lanceolate, borne at intervals up the stem, stiff, spreading, about 10 cm. long; sheaths with a membranous, convex, often wrinkled and red-dotted area at the mouth of the sheath opposite the blade insertion; bracts 3/4–1 1/2 times as long as the rays; spikelets lanceolate 6–10 × 2–2.5 mm. [23. mundtii](#)
Leaves linear, flat, long acuminate, up to 60 cm. long; sheath concave at the mouth, splitting early; longest bract 2–3 times as long as the rays; spikelets elliptical to oblong, about 15 × 4 mm. [4. nitidus](#)
- 6 Spikelets white or greenish-white even at maturity, borne in a capitate cluster: **7**
Spikelets yellow, brown, red or black, at least at maturity; inflorescence various: **9**
- 7 Leaves capillary, not more than 1 mm. broad; culms thickened below by brown fibrillose remains of leaf-sheaths; spikelets few, 3–4 mm. broad, subacute [7. scaëttae](#)
Leaves flat, 1–5 mm. broad; spikelets numerous (more than 15), about 2.5 mm. broad, acute: **8**
- 8 Robust plant, stem about 2.5 mm. broad; spikelets up to 30 mm. long, in a short, branched, bracteate spike; glumes lanceolate; achene broadly elliptical [9. cataractarum](#)
Stem 1.5–2 mm. broad; spikelets up to 15 mm. long, sessile or nearly so; glumes ovate; achene obovate [8. smithianus](#)
- 9 Glumes with a distinct white membranous margin and broad rounded green keel; plant robust, with a spreading anthelate inflorescence; spikes compound; spikelets distant; glumes brown, spreading to reveal the black achene [17. macrostachyos](#)
Glumes with no white membranous margin or if a narrow one then slender annuals: **10**
- 10 Spikelets ovate, 2–4 mm. long, 8–12 flowered, in small compound spikes; stems clustered, shortly woody at the base; leaves flat; glumes black with conspicuous green keels [6. elegantulus](#)
Spikelets elliptical, lanceolate or linear, more than 4 mm. long: **11**

- 11 Glumes with an acute green keel excurrent in a mucro : 12
 Glumes acute, obtuse or obtuse and apiculate: 14
- 12 Spikelets up to 5 per stem, solitary in the axils of bracts arranged in a simple spike, broadly elliptical, about 10 × 4 mm. [26. *divulsus* subsp. *africanus*](#)
 Spikelets numerous in an anthelate inflorescence: 13
- 13 Weak annual 5–40 cm. high; spikelets linear 4–16 × 1 mm.; glumes lax, spreading to reveal the wide, pale rhachilla [22. *pumilus*](#)
 Perennial, culms arising from a short broad rhizome covered with black fibres; spikelets lanceolate, about 10–15 × 3 mm., compressed, brown, channelled; achene obovate or suborbicular, white muriculate, obtuse or apiculate [21. *acuticarinatus*](#)
- 14 Inflorescence a digitate or very shortly spicate cluster of spikelets, sometimes either reduced to 1 or 2 spikelets or enlarged by the addition of a lateral rayed spike: 15
 Inflorescence with several unequally rayed spikes; rays sometimes very short: 22
- 15 Caespitose perennial; culms arising from a slender yellow rhizome; spikelets linear-lanceolate, 10–16 × 2.5–3 mm., yellow; glumes obtuse with a narrow golden sinuate margin; achene chestnut, punctulate, apiculate [10. *lanceolatus*](#)
 Annual with fibrous roots: 16
- 16 Spikelets linear up to 1.5 mm. broad; leaves capillary: 17
 Spikelets 1.5 mm. broad or more: 18
- 17 Glumes black with a narrow white membranous margin; spikelets less than 1 mm. broad; achene muriculate [15. *melas*](#)
 Glumes golden to dark brown; spikelets 1–1.5 mm. broad; achene punctulate [16. *capillifolius*](#)
- 18 Spikelets dark reddish black with a narrow membranous margin, lanceolate, about 10 × 2.5 mm.; glumes with a narrow insertion exposing the wide straight rhachilla; leaves narrow, inrolled; longest bract erect; achene obovate or suborbicular, black, punctulate [25. *atrorubidus*](#)
 Spikelets straw-coloured to brown: 19
- 19 Spikelets usually up to 5 per stem, broadly elliptical to oblong-lanceolate, 3.5–5 mm. broad: 20
 Spikelets usually more than 5, narrowly elliptical to linear, 1.5–2.5 mm. broad: 21
- 20 Spikelets 1–2 per stem, strongly compressed; glumes golden, tinged and tipped dark red (rare) [24. *pauper*](#)
 Spikelets generally more than 2 per stem, somewhat compressed, obtuse; glumes pale, becoming golden at maturity [12b. *pseudodiaphanus* var. *occidentalis*](#)
- 21 Spikelets numerous, linear, about 1.5 mm. broad [27. *fallaciosus*](#)
 Spikelets narrowly elliptical, 2–2.5 mm. broad [28. *flavescens*](#)
- 22 Spikelets very dark red-brown to black; perennials; stems 40–100 cm. high; glumes lanceolate, imbricate: 23
 Spikelets pale to dark brown: 24
- 23 Leaves up to 4.5 mm. broad, flat; spikelets 12–20 mm. long with about 30 glumes; achene black, narrowly elliptical; stamens 2, anthers about 0.5 mm. long [13. *nuerensis*](#)
 Leaves about 2 mm. broad, inrolled; spikelets 10–14 mm. long with about 20 glumes; achene brown; stamens 3, anthers about 1 mm. long [14. *testui*](#)
- 24 Rhizomatous perennial; culms erect, 50–100 cm., sharply triangular; leaf-sheaths tinged red-purple; bracts sharply keeled, spinulose-serrulate on the margin; rays stiff, up to 10 cm.; spikelets golden, elliptical, 10–15 × 4 mm., channelled [5. *unioloides*](#)
 Annuals, or perennials without the above combination of characters: 25
- 25 Inflorescence lax, spreading, forming 1/3–1/2 height of the plant, with capillary rays up to 12 cm. long; spikelets lanceolate, golden to brown, compressed; glumes obovate, obtuse and minutely apiculate, spreading to reveal the discoid black achene; rhachilla markedly zig-zag [18. *pelophilus*](#)
 Inflorescence not forming more than 1/4 height of plant; rhachilla not markedly zig-zag: 26
- 26 Achene narrowly elliptical to oblanceolate, distinctly papillate with papillae in longitudinal rows; spikelets acute, pale becoming more or less tinged reddish-brown; glumes elliptical, regularly imbricate giving the spikelet a neat “plaited” appearance : 27
 Achene broadly elliptical, obovoid or spherical: 29
- 27 Spikelets more or less erect in dense fascicles; rays generally up to 3 cm. long, sometimes almost wanting; stamens generally 2, anthers about 0.4 mm. long [19a. *polystachyos* var. *polystachyos*](#)
 Spikelets spreading in lax branched spikes, rays often exceeding 3 cm.; glumes often tinged chestnut-brown; stamens generally 3: 28

- 28 Spikelets about 1.0 cm. long by 1.5 mm. broad; glumes 1.5 mm. long; anthers about 0.8 mm. long [19b. polystachyos var. laxiflorus](#)
Spikelets up to 2.5 cm. long by 2 mm. broad; glumes 2 mm. long; anthers 1.0–1.2 mm. long [20. ferrugineus](#)
- 29 Achene obovoid, slightly compressed, beakless, punctulate; robust erect plant to 70 cm. high; spikelets golden, tinged brown, 10–18 × 3–4 mm., channelled; stamens 3 [11. mertonii](#)
Achene not punctulate: **30**
- 30 Achene compressed with a surface pattern of vertically much elongated cells in irregular transverse bands separated by raised ridges: **31**
Achene subspherical with a surface pattern of hexagonal cells, not much elongated vertically with a greyish white horizontal muriculation 12. pseudodiaphanus **32**
- 31 Inflorescence with well developed rays and lax-spikeletted spikes; spike-lets acute; glumes broadly elliptical, generally tinged red-brown, very obtuse, 2.5–3 mm. long [29. intermedius](#)
Inflorescence with generally short rays, often reduced to a single spike; spikes more or less dense-spikeletted; glumes broadly ovate, generally golden, 2–2.5 mm. long [28. flavescens](#)
- 32 Spikelets 2–3 mm. broad; glumes 1.6–2.1 mm. long; achene 0.7–0.95 × 0.6–0.9 mm. [12a. pseudodiaphanus var. pseudodiaphanus](#)
Spikelets 3.5–5.0 mm. broad; glumes 2.4–2.7 mm. long; achene 0.9–1.25 × 0.9–1.05 mm. [12b. pseudodiaphanus var. occidentalis](#)

1. **Pycreus waillyi** *Cherm.* in *Bull. Soc. Bot. Fr.* 85: 366 (1938). *APD acc*

Submerged or floating with an inflorescence of spikelets borne singly; [in shallow water](#).

Mali: Dogo (Mar.) Davey 6! Gao to Bena (Feb.) de Wailly 5340!

Also in [Zambia](#).

2. **Pycreus demangei** *J. Raynal* in *Kew Bull.* 23: 314 (1969). *APD acc*

Similar to *P. waillyi* *Cherm.* in its floating habit but having very slender (filiform) stems and leaves and clustered spikelets; [flood plains](#).

Mali: Dogo (Feb.) Demange 1589! 3114! (Jan., Mar.) Davey 168! 575! Sarédina, Debo (Sept) Demange in J. & A. Raynal 11297!

Also in [Chad](#).

3. **Pycreus felcis** *J. Raynal* in *Kew Bull.* 26: 568 (1972)

APD: Synonym of Cyperus felcis (J. Raynal) Lye

Slender herb with straggling branched stems, setaceous leaves and 1–2 sessile pseudolateral spikelets, 5–12 × 3 mm.; near surface water.

Guin.: Fouta Djallon Jac.-Fél. 7413 b!

4. **Pycreus nitidus** (*Lam.*) *J. Raynal* in *Kew Bull.* 23: 314 (1969). *APD acc*

Cyperus nitens *Lam.*, *Ill. Gen.* 1: 145 (1791).

Pycreus lanceus (*Thunb.*) *Turrill* in *Kew Bull.* 1925: 67 (1926).

Cyperus lanceus *Thunb.*, *Prodr. Pl. Cap.* 18 (1794); *Kük. l.c.* 333.

Pycreus umbrosus *Nees* in *Linnaea* 10: 130 (1836); *F.T.A.* 8: 303.

Robust plant, with culms up to about 60 cm. and a yellow to dark red-brown inflorescence; [in or near permanent water](#).

Sen.: Hann (Apr.) Chev. 25711! Niakoulrab (May) Berhaut 661! 5181! Malika to Yombeul (Nov.) Pitot! Berr Tialane (May) J. & A. Raynal 58921 Lompoul (Mar.) J. & A. Raynal 13653! **Dah.:** Cadjehoun, Cotonou (Feb.) J. & A. Raynal 13528! **Niger:** Guidimouni (July) P. de Fabrègues 524! 1892! **N. Nig.:** Matyoro (Feb) Thornewill 158! Baga Seyoram, L. Chad (Mar.) Gwynn 112! **W. Cam.:** Babeni, Ndop Plain (Apr.) Brunt 372!

Africa south of the Sahara and [Madagascar](#); also in [Palestine](#).

5. **Pycreus unioloides** (*R. Br.*) *Urb. Symb. Antill.* 2: 164 (1900). *APD acc*

Cyperus unioloides R. Br., Prodr. Fl. Nov. Holl.: 216 (1810); Kük. l.c. 338.

Pycneus angulatus (Nees) Nees in Linnaea 9: 283 (1835); C.B. Cl., Illustr. Cyper. t. 4 (1909); F.T.A. 8: 305; F.W.T.A., ed. 1, 2: 490.

Erect plant, woody at the base with an inflorescence of large golden spikelets; [swamps or moist places in savanna](#).

Gam.: (Aug.) Ruxton 82! **Mali:** Klela, Sikasso (Aug.) Demange 2906! **Iv. C.:** Kodiokoffi, Baoulé Pobéguin 109! Chev. 22323! **U. Volta:** Banfora (June) Leeuwenberg 4358! **Ghana:** Sampa, N.W. Ashanti (Apr.) Morton A3268! **S. Nig.:** Shaki Dist. (Aug.) Latilo & Taylor FHI 43398!

Pantropical.

6. *Pycneus elegantulus* (Steud.) C.B. Cl. in Dur. & Schinz, Consp. Fl. Afr. 5: 538 (1895).

APD: *Synonym of Pycneus niger subsp. elegantulus* (Steud.) Lye

Cyperus elegantulus Steud. in Flora 25: 583 (1842); Kük. l.c. 342.

Plant with a compact anthelate inflorescence of small black strongly compressed spikelets with green keels, subtended by long bracts; [in swamps](#).

N. Nig.: Mambila Plateau (Mar.) J. Hall 1642! **W. Cam.:** Bamenda, 5,000 ft. (May) Brunt 1137! Bafut-Ngemba F.R., Bamenda (May) Daramola FHI 41183! **F. Po:** 8,500 ft. (Apr.) Mann 1470!

Throughout tropical and S. Africa.

[Closely approaching, especially in the Fernando Po specimen, the central and S. American species *P. niger* (Ruiz ife Pavon) Cufodontis.]

7. *Pycneus scaëttae* Cherm. in Bull. Jard. Bot. Brux. 13: 278 (1935).

APD: *Synonym of Pycneus fibrillosus* (Kük.) Cherm.

Cyperus fibrillosus var. *scaëttae* (Cherm.) Kük. l.c. 348 (1936).

Small tufted perennial with a white head of spikelets; [montane grassland liable to burning](#).

W. Cam.: Bafut-Ngemba F.R., Bamenda, 5,500–7,000 ft. (Mar.) Hepper 2241! Coombe 213! Lake Bambulue, Bamenda (Apr.) Morton K. 268!

Also in **E. Cameroun** and **Congo**.

8. *Pycneus smithianus* (Ridley) C.B. Cl. in Dur. et Schinz, Consp. Fl. Afr. 5: 542 (1895); F.T.A. 8: 301.

APD acc

Cyperus smithianus Ridley in J. Bot. 22: 15 (1884); Kük. l.c. 349.

Similar to *P. scaëttae* but larger, with grasslike leaves and a white head of numerous spikelets; [river banks and other damp open habitats](#).

Guin.: Friguiagbé (June) Chillou 531! Macenta (Apr.) Pitot! Dabola (Apr.) Pitot! Madlra Tossekré, (Oct.) Adam 12514! **S. L.:** Falaba (Apr.) Deighton 1645! **U. 20. *Pycreus ferrugineus* (Poir.) C.B. Cl. in Hook. f., Fl. Brit. Ind. 6: 593 (1893).

APD: *Synonym of Pycreus intactus* (Vahl) J. Raynal

Cyperus ferrugineus Poir. in Lam., Encycl. 7: 261 (1806).

Similar to 19b but more robust; in similar habitats but less widespread.

Sen.: Baïla Bignona (Sept.) Adam 18115! Kabrousse (Oct.) Adam 18295, partly!

[This Madagascan and 8. African species appears to have been introduced into West Africa. The relationship of West African plants to *Pycreus polystachyos* requires investigation.]

21. *Pycreus acuticarinatus* (Kük.) Cherm. in Bull. Soc. Bot. Fr. 81: 262 (1934). *APD acc*

Cyperus acuticarinatus Kük. in Fedde, Rep. 12: 93 (1913).

C. macranthus var. *mucronatus* f. *acuticarinatus* Kük. in Engl., Pflanzenr. Cyper. 389 (1936).

C. crustaceus Raymond in Garcia de Orta 11: 374 (1963).

Pycreus angulatus of F.W.T.A., ed. 1, 2: 490.

Caespitose from a woody base, spikelets golden-brown and characterized by the acute and mucronate glumes; wet grassland in savanna region.

Mediterranean region, and throughout Africa, and in **Madagascar**.

24. *Pycreus pauper* (A. Rich.) C.B. Cl. in Dur. & Schinz, Consp. Fl. Afr. 5: 540 (1895). *APD acc*

Cyperus pauper Hochst. ex A. Rich., Tent. Fl. Abyss. 2: 478 (1851); Kük. l.c. 394.

Slender tufted annual with few large elliptical spikelets; **boggy ground**.

N. Nig.: Kufena, Zaria Prov. (Aug.) Kershaw 900698!

Also in **E. Cameroun**, **Central African Republic**, **Ethiopia** and **SE tropical Africa**.

25. *Pycreus atrorubidus* Nelmes in Kew Bull. 6: 320 (1952). *APD acc*

Cyperus atrorubidus (Nelmes) Raymond in Nat. Canad. 91: 127 (1964).

More or less caespitose plants with dark red-black spikelets in a sessile pseudo-lateral cluster; **damp places on mountains to 5,000 ft.**

Guin.: Tossékéré, Labé (Oct.) Adam 12732! Nzérékoré (Oct.) Jac.-Fél. 1923! **S. L.:** Bintumane Peak (Oct.–Nov.) Jaeger 400! 7886! **Lib.:** Nimba Mts. (Aug.) Schnell 6241! **iv. C.:** Nimba Mt., 4,500 ft. (Aug.) Boughey GC 18164!

Also in **SE Africa**.

26. *Pycreus divulsus* subsp. *africanus* Hooper in Kew Bull. 26: 579 (1972).

APD: *Synonym of Pycreus africanus* (S.S. Hooper) Reynders

Unique in its few large spikelets each sessile in the axil of a bract and arranged in a spike; **open grassland**.

S. L.: Freetown (Nov.) Deighton 1868! **N. Nig.:** Farin Rua, Plateau Prov. (Aug.) J. Hall 652!

Also in **E. Cameroun**, **Ethiopia** and **Zambia**.

Subsp. *divulsus* comes from Madagascar.

27. *Pycreus fallaciosus* Cherm. in Arch. Bot. Caen 7, Mém. 4: 7 (1936).

APD: *Synonym of Pycreus flavescens* subsp. *fallaciosus* (Cherm.) Lye

Cyperus fallaciosus (Cherm.) Raymond in Nat. Canad. 91: 129 (1964).

Differing from *P. flavescens* in the narrower spikelet and narrower brown achene; **damp places**.

Sen.: Massadala Trochain 3538! 3545! **Mali:** Djenné (July) Chev. 1141! **Guin.:** Dabola (Apr.) Unknown Collector! **Ghana:** Oti R., Zabzugu (Apr.) Morton GC 9057! Yeji (Apr.) Hall VBS 1279! Pantropical and in temperate regions extending to central Europe, Himalayas, Canada and southern Brazil.

29. *Pycreus intermedius* C.B. Cl. in F.T.A. 8: 290 (1901); J. & A. Raynal in Adansonia sér. 2, 7: 320 (1967). *APD acc*

Cyperus intermedius Steud. in Flora 25: 581 (1842), and Syn. Pl. Glum. 2: 5 (1855); not of Guss. (1832).

C. subintermedius Kük. l.c. 390 (1936).

Similar to *P. flavescens*, but a generally taller plant with a more expanded inflorescence of acute spikelets; **damp places**.

Sen.: Badène, Casamance (Jan.) J. & A. Raynal 7958! Mare Diamowel, Niokolo-Koba (Dec.) J. & A. Raynal 6889!

Scattered throughout tropical Africa and in **Madagascar**.

6. KYLLINGA

Rottb., Descr. Ic. Nov. Pl. 12 (1773); F.T.A. 8: 268; nom. cons.

Cyperus subgen. *Kyllinga* (Rottb.) Valck.-Sur.—Kükenthal in Engl., Pflanzenr. Cyperaceae—Scirpoideae—Cypereae 566 (1936).

- 1 Inflorescence of several subequal rays; spikelets few, remote; plant annual [1. debilis](#)
 Inflorescence capitate, with one or more short spikes bearing crowded spikelets: **2**
- 2 Annual with wing of glume having lobes about 1 mm. long; achene suborbicular [2. squamulata](#)
 Perennial, or annual not having a lobed wing to the glume: **3**
- 3 Plant with tuberous stem bases and thread-like slender rhizomes; spikelet with at least 4 opaque, white flowering glumes [3. bulbosa](#)
 Plant not having many slender rhizomes; spikelet with 2 or 3 flowering glumes: **4**
- 4 Central (or only) spike of inflorescence cylindrical, white, greenish-white or pink: **5**
 Central (or only) spike of inflorescence spherical, ovoid or ellipsoidal, rarely cylindrical and then golden: **7**
- 5 Plant with a slender stem, slightly swollen at the base; centre spike about 4 × 3 mm., pinkish with 1–2 small lateral spikes; glumes scarcely exceeding achene [18. tisserantii](#)
 Plant with more or less well developed rhizome; glumes exceeding achene: **6**
- 6 Plant with a thick, often vertical stem covered with fibrous remains of leaf-bases; keel of glume generally smooth, thickened [17. appendiculata](#)
 Plant with a thin, horizontal rhizome; keel of glume often ciliate, green [4. odorata](#)
- 7 Plant caespitose without a conspicuous rhizome; flowering stems crowded: **8**
 Plant rhizomatous: **13**
- 8 All heads of a single spherical spike: **9**
 At least some heads of more than one spike; **10**
- 9 Spike 10–12 mm. wide, reddish when dry; keel of glume with a wide, finely ciliate wing; leaves 2–4 mm. broad [5. nigritana](#)
 Spike 8–10 mm. wide, white even when dry; keel with an inconspicuous wing; leaves often decaying into black fibres [6. echinata](#)
- 10 Spikes more or less confluent into a reddish hemispherical head, 7–10 mm. across, partially enveloped by the broad bases of the bracts; leaves glaucous, lower leaf-sheaths and roots purple; achene obovate; in saline swamps [7. robusta](#)
 Spikes discrete, not reddish: **11**
- 11 Leaf-sheaths usually entire, pale crimson, not fibrous; glumes equal, with white, weakly nerved sides, a conspicuous green ciliate keel and recurved apiculus [8. pumila](#)
 Leaf-sheaths usually becoming fibrous; stem bases often thickened; upper of two flowering glumes smaller than lower, distinctly stipitate, tips of glumes not recurved: **12**
- 12 Keel of glume conspicuously winged and ciliate; achene broadly elliptical. little exceeded by the glumes [9. welwitschii](#)
 Keel of glume smooth or sparingly ciliate; achene elliptical or ovate generally much exceeded by the glumes [10. tenuifolia](#)
- 13 Inflorescence of a single spherical spike, 8–12 mm. across, subtended by 3 short, often very short, bracts;

- spikelets elliptical, somewhat blunt; stems spongy 2–3 mm. wide, tinged purple below; generally lower, and often all, leaves bladeless; rhizome aromatic, scales cinnamon-coloured [11. peruviana](#)
- Inflorescence of one or more cylindrical, hemispherical or ovoid spikes; spikelets acute, often with spreading tips to the glumes; stems leafy: **14**
- 14** Spike solitary, golden with green keels; spikelets large (about 4–5 mm.) with acuminate, spreading tips: **15**
- Spikes one or more, white, greenish-white or yellow-green: **16**
- 15** Rhizome elongate, generally flexuose and slender when dry, loosely invested with elliptical, apiculate, scarious, pink-tinged scales; leaves and bracts about 5 mm. broad, flaccid, acuminate, bracts erecto-patent or patent; (F. Po, W. Cam.) [12. elatior](#)
- Rhizome thick with ovate, acute scales; bracts deflexed at maturity; spike large (about 10–12 × 6–8 mm.); (N. Nig.) [13. melanosperma](#)
- 16** Rhizome thin, wiry, generally elongated between the flowering stems, closely invested with dark scales: **17**
- Rhizome thicker, generally bearing a row of contiguous flowering stems: **18**
- 17** Head small, 4–5 mm. across, subtended by three stiff bracts; glumes white with green keels [14. brevifolia](#)
- Head 5–10 mm. across, subtended by 4 long, flaccid bracts; glumes membranous below, opaque and spongy above, red dotted [15. nemoralis](#)
- 18** Rhizome horizontal covered with more or less persistent, ovate, acute, dark margined scales **16. erecta** **19**
- [@](#)
- Rhizome short, often vertical: **21**
- 19** Bracts generally 3, short to fairly long; spike rarely more than one, ovoid, greenish-white or yellow; glumes smooth or very sparsely ciliate on the keel [16a. erecta var. erecta](#)
- Bracts 4–7: **20**
- 20** Bracts 4–5; spike solitary, spherical, white; glumes smooth or somewhat ciliate [16b. erecta var. africana](#)
- Bracts 4–7, long; spikes several, confluent, greenish white or yellow-green; glumes ciliate on the keel [16c. erecta var. polyphylla](#)
- 21** Rhizome covered with reddish scales or their fibrous remains; keel of glume generally smooth, thickened, opaque [17. appendiculata](#)
- Rhizome not covered with scales; keel of glume smooth or ciliate, not thickened [4. odorata](#)

1. *Kyllinga debilis* C.B. Cl. in Mém. Soc. Bot. Fr. 2, 8: 26 (1907); Berhaut. Fl. Sén. ed. 2, 376. *APD acc*

Cyperus leptorhachis Mattf. & Kük. in Engl., Pflanzenr. Cyper. 595, fig. 63 A–D (1936).

A weak caespitose annual 5 to 30 cm. tall, with a Mariscus-like inflorescence but broadly obovate one-fruited spikelets; **in dry, rocky places.**

Sen.: Camberené (Nov.) Pitot! Tambacounda Berhaut 620! 3181. Tambacounda to Sambailo (Sept.) Pitot! **Mali:** Gulo Kourou (Aug.) Jaeger 8! Kita (Sept.) Jaeger 93! Bamako (Sept.) Adam 15034! Throughout tropical Africa and America, also in **Madagascar**.

5. **Kyllinga nigritana** *C.B. Cl.* in F.T.A. 8: 272 (1902).

APD: *Synonym of Cyperus nigritanus (C.B. Clarke) Lye*

Kyllinga ascolepidioides *Cherm.* in Arch. Bot. Caen 4, Mém. 7: 4 (1931).

? **K. alata** *Nees* in Linnaea 10: 139 (1835), as *allata*; F.W.T.A., ed. 1, 2: 487; Aké Assi, Contrib. 2: 71.

Cyperus cristatus var. **nigritanus** (*C.B. Cl.*) *Kük.* l.c. 610 (1936) (as to W. African specimens only).

A tufted perennial, with aromatic roots, leaves up to 26 cm. long and a spherical head of large, winged spikelets; **in savanna**.

iv. C.: Foro-foro Forest, 25 km. N. of Bouaké (Sept.) Oldeman 416! **Ghana:** Bole (May) Morton GC 7693! Banda (Apr., Aug.) Morton A3292! Hall 1993! Kintampo (Aug.) Hall 2056! **N. Nig.:** Damaturu, Bornu Prov. (Aug.) De Leeuw 1072! Nupe Barter 1588!

Also in the Central African Republic; and this or closely related species of the *K. alba* Nees complex throughout tropical Africa.

6. **Kyllinga echinata** *Hooper* in Kew Bull. 26: 580 (1972). *APD acc*

Tufted plant with capillary stems to 40 cm. high, leaf-sheaths readily splitting into black fibres, capillary leaves and bracts and rounded heads of long-tipped white spikelets; **damp sandy ground**.

Ghana: Adamso, NW. Ashanti (Nov.) Harris! Kaleo Hill, nr. Wa (Apr.) Adams 4006! Damongo (Mar.–July) Morton GC 8664! Adams 953! Damongo to L. Kpirri (Mar.) Adams 3961!

7. *Kyllinga robusta* Boeck. in Linnaea 35: 409 (1863).

APD: *Synonym of Cyperus afrorobustus* Lye

Kyllinga caespitosa var. *major* Nees in Mart., Fl. Brasil. 2, 1: 12 (1842).

Cyperus densicaespitosus var. *major* (Nees) Kük. l.c. 599 (1936).

A strongly caespitose perennial with a reddish, irregularly hemispherical head partially enveloped by the broad bract-bases; **confined to brackish swamps**.

Sen.: Kayar (Mar.) Pitot! **Gam.:** Pakali Nding Raynal 7978! **Guin.:** Ouassou (Nov.) Jac.-Fél. 7252! **S. L.:** Rokupr (Mar.) Jordan 414! Tumbu, Little Scarcies R. (Apr.) Glanville 207! Throughout coastal regions of W. Africa to the Congo and in **central S. America** and **tropical S. America**.

12. **Kyllinga elatior** Kunth Enum. Pl. 2: 135 (1837); F.T.A. 8: 275. *APD acc*

Cyperus aromaticus var. **elatior** (Kunth) Kük. l.c. 582 (1936).

Rhizome creeping; head cylindrical, bracts very long; **in grassland and on forest paths.**

W. Cam.: Cam. Mt. (Jan.) Dunlap 60! Buea, 3,000–4,000 ft. (Nov.–Mar.) Migeod 67! Maitland 329! 2 Morton GC 6746! Bamessi, Ndop Plain (Apr.) Brunt 320! **F. Po.**: Moka, 4,000 ft. (Dec.) Boughey 114!

Also in **E. Cameroun** and throughout tropical and S. Africa.

13. **Kyllinga melanosperma** Nees in Wight, Contrib. Bot. Ind. 91 (1834); F.T.A. 8: 277. *APD acc*

Cyperus melanospermus (Nees) Valck.-Sur., Het Gesl. Cyp. in Mal. Archip. 50 (1898).

Rhizome thick, creeping; spike large cylindrical, golden; **damp places.**

N. Nig.: Kuna, Pankshin Dist. (June) Okafor FHI 59252! Jos Plateau (Apr.) Lely P227!

From Nigeria throughout tropical and S. Africa, also in **Madagascar** and the **Old World tropics**.

[This species is recorded from the flora area by Kükenthal and the above cited specimens agree with Indian specimens in inflorescence characters; however, both are incomplete and might represent large specimens of the closely allied *K. elatior*.]

14. **Kyllinga brevifolia** *Rottb.* Descr. et Icon. 13, t. 4, fig. 3 (1773); F.T.A. 8: 273; C.B. Cl., Ill. Cyper. t. 1, fig. 1–4 (1909). *APD acc*

Kyllinga colorata of F.W.T.A., ed. 1, 2: 487.

Cyperus brevifolius (*Rottb.*) *Hassk.*, Catal. Bogor. 24 (1844); Kük. l.c. 600 (1936).

Similar to *K. erecta* in the inflorescence but having an elongated slender rhizome; **in damp places**.

Lib.: Bushrod I., Monserrado Dist. (Nov.) Winne 557! Monrovia (June) Dinklage 2233! White Plains (May) Dinklage 2705! **S. Nig.:** T. Vogel 37! **W. Cam.:** Ekona (Aug.) Chumil CDG 374!

Tropical and subtropical regions of the Old and New Worlds.

15. **Kyllinga nemoralis** (*Forst.*) *Dandy ex Hutch.* in F.W.T.A., ed. 1, 2: 487 (1936). *APD acc*

Thyrocephalon nemorale *J.R. & G. Forst.*, Char. Gen. Pl. 130 (1776).

Kyllinga monocephala *Rottb.*, Descr. et Icon. 13, t. 4, fig. 4 (1773), partly, excl. syn., nom. illeg.; F.T.A. 8: 272; C.B. Cl., Illustr. Cyper. t. 2, fig. 1–2 (1909).

Cyperus kyllingia *Endl.*, Cat. Hort. Acad. Vindob. 1: 94 (1842); Kük. l.c. 606, tab. 64 C–D.

Rhizome slender, creeping, bearing stems at intervals, bracts and leaves long, flaccid, nut black; **a weed of secondary forest and disturbed habitats**.

Guin.: Macenta to Kérouané (Nov.) Adam 6970! **Lib.:** Linder! Monrovia (May–June) Dinklage 2181! 2713! Cape Palmas Schönlein! **Iv. C.:** Niégré Forest (Sept.) Nozeran! Sassandra (May) Chev. 17919! Throughout tropical and S. Africa, also in **Madagascar** and the **Mascarenes**.

17. *Kyllinga appendiculata* K. Schum. in Engl., Bot. Jahrb. 24: 338 t. 4, fig. A–G (1898), fig. poor.

*APD: Synonym of *Cyperus afrosylvestris* Lye*

Kyllinga cylindrica var. *appendiculata* (K. Schum.) C.B. Cl. in F.T.A. 8: 283 (1902).

Kyllinga cylindrica var. *major* C.B. Cl. in F.T.A. 8: 283 (1902).

Cyperus sesquiflorus var. *major* (C.B. Cl.) Kük. l.c. 594 (1936).

Rhizome short, scaly; leaves long, often equalling stems; head pyramidal with an elongated central spike; **alpine grassland**.

W. Cam.: Cam. Mt., 7,000 ft. (Nov.) Mann 2104! Mann's Springs, 7,500 ft. (Apr.) Morton GC 7092! Buea Preuss 923! Mba Kokeka, Bamenda, 7,000 ft. (Mar.) Richards 5325! Bamenda to Santa (July) Daramola FHI 41564! **F. Po:** 7,500 ft. (Apr.) Mann 1474! Clarence Peak, 8,500 ft. (Dec.) Mann 659!

Also in **E. Cameroun** and **Ethiopia**.

18. *Kyllinga tisserantii* Cherm. in Arch. Bot. Caen 4, Mém. 7: 6 (1931).

*APD: Synonym of *Cyperus breviglumis* Lye*

Similar to small specimens of *K. odorata* but with reddish spikelete less than 2 mm. long, and glumes scarcely exceeding the spherical nut; **damp places**.

S. L.: Koinadugu Dist. (Aug.) Haswell 231! **iv. C.:** Mont Doura, Koualé (May) Chev. 21728! **N. Nig.:** Naraguta (June) Lely 324! **W. Cam.:** fide Kük. l.c.

Also in the **Central African Republic**.

7. SCIRPUS

Linn., Sp. Pl. 1: 47 (1753); F.T.A. 8: 446 (1902).

- 1** Perennial with an elongated rhizome and tuberous stem-bases; stems stoutly triangular, bearing several spirally arranged, broadly laminate leaves; bracts two or more, leafy, all spreading or one erect; inflorescence of one to several large, golden or rufous spikelets; glumes scarious, bifid at the membranous apex with a recurved arista; achene large with retrorsely scabrid bristles: **2**

Annual or perennial without the above combination of characters: **3**

- 2** Inflorescence of 1–6 broadly ovate, golden spikelets, 15–20 × 10 mm. style bifid; achene lenticular **1.**
grandispicus

Inflorescence of numerous, elliptic to cylindric rufous spikelets 15–30 × 5 mm.; style trifid; achene trigonous **2.**
maritimus

-
- 3 Flowering stems bearing one or two spikelets; if two then spikelets not exceeding 4 mm. long:4
 Flowering stems either with more than 2 spikelets or with 2 spikelets more than 4 mm. long:8
- 4 Spikelet solitary, 5–8 × 4 mm., obtuse, rufous or brownish black, terete; glumes scarious, persistent; stems and leaves filiform[3a. angolensis var. brizaeformis](#)
 Spikelets not exceeding 4 × 2 mm.:5
- 5 Spikelets always solitary, terminal, acute, without a conspicuous bract; water plant with elongated, flaccid, leafy stems[5. fluitans](#)
 Spikelets 1 or 2, apparently lateral with an erect and stem-like bract; glumes dark brown with a green or pale tip:6
- 6 Style trifid; achene longitudinally ridged [6. setaceus](#)
 Style bifid; achene papillate:7
- 7 Transparent scale(s) present within the broadly obovate, obtuse and mucronulate glume; sterile tip to anther connective large[7. isolepis](#)
 Transparent scale absent; glume elliptic or oblanceolate, acute and apiculate; sterile tip to connective small[8. micranthus](#)
- 8 Spikelets sessile in a single apparently lateral (pseudolateral) cluster subtended by a stem-like, generally erect bract:9
 Spikelets not in a single, pseudolateral cluster:15
- 9 Flowers with simple retrorsely-scabrid bristles; rhizomatous perennial; bract sharply trigonous, sometimes deflexed at fruiting [10. mucronatus](#)
 Flowers without bristles; bracts not sharply trigonous:10
- 10 Stems and bracts septate with transverse septa and more or less pronounced constrictions visible externally: .11
 Stems and bracts not septate; stigmas 2:13
- 11 Stems about 5 mm. broad, spongy above, narrower below, with well-marked constrictions at the septa; spikelets 8–10 mm. long; glumes acute, about 5 mm. long, rusty brown with a broad green keel; achene smooth, black[11. articulatus](#)
 Stems not exceeding 3 mm. broad; glumes less than 5 mm. long, five-ranked; achene undulately ridged, black or brown:12
- 12 Stems about 2.5 mm. wide; glumes about as long as wide, very concave and obtuse, producing a terete, turgid spikelet; achene 1.0–1.7 mm. long[12. jacobii](#)
 Stems not exceeding 1.5 mm. wide; glumes longer than wide, chaffy, clearly five-ranked, persistent and spreading after maturity producing a cylindrical spikelet; achene 0.85–1.15 mm. long[13. roylei](#)
- 13 Small annual with filiform stems and leaves; spikelets few, dark red-brown with paler tips, 1.5–3 × 1 mm., obtuse[8. micranthus](#)
 Stems, and leaves when present, not filiform; spikelets greenish, yellowish or straw-coloured with dark tips, more than 3 × 1 mm., acute or acuminate; basal flowers usually present:14
- 14 Bracts very long, exceeding stems; sheaths bladeless; spikelets greenish or yellowish, generally 2, often curved, 10–15 × 2–3 mm.[14. oxyjulos](#)
 Bracts not exceeding stems; sheaths with a short or long blade; spikelets greenish with dark tips, 5–10 × 2 mm., acute [15. uninodis](#)
- 15 Inflorescence terminal; bracts several, spreading or reflexed:16
 Inflorescence pseudolateral, with an erect bract continuing the line of the stem; spikelets in one sessile and one to many stalked clusters or spikes, or sometimes solitary:19
- 16 Annual; spikelets several, crowded in a single greenish head; glumes with a long recurved arista[9. kernii](#)
 Perennial; glumes without a long recurved arista:17
- 17 Leaves distichous; shoots flattened; sheaths tough, often red; spikelets distinct, generally not exceeding 10 in number, very dark brown or black, in a contracted panicle or capitate cluster[4. bulbostylidoides](#)
 Leaves not distichous; spikelets crowded, numerous, white or green and brown:18
- 18 Inflorescence a single white head up to 8 mm. across; plant slender; bracts spreading or reflexed[22. microcephalus](#)
 Inflorescence a lobed green or brown head often with additional shortly stalked heads forming a flatfish corymb; bracts several, spreading; glumes white ciliate on the margin and with a strong green apiculus [23. cubensis](#)
- 19 Flowers with laminate, pectinate bristles surrounding the achene:20
 Flowers with simple bristles or bristles absent:21
- 20 Inflorescence lax; spikelets on long pedicels; glumes with a broad pale membranous only slightly ciliate margin,

- stems up to 10 mm. broad, obtusely trigonous above, often tinged yellow below; achene about 2×1.5 mm. [18. *litoralis*](#)
- Inflorescence rather dense; spikelets on short curved pedicels; glumes with a very narrow membranous, distinctly ciliate margin; stems up to 15 mm. broad, terete except immediately beneath the inflorescence, spongy; achene about 2.5×1.5 mm. [19. *pterolepis*](#)
- 21** Rush-like plants with a creeping rhizome and spongy, terete stems up to 2 m. high, bearing bladeless sheaths and a corymbose inflorescence : **22**
- Tufted plants less than 1 m. high with or without bladed sheaths; spikelets either solitary or in one sessile and one to few stalked clusters or spikes: **23**
- 22** Bract with a sheathing base and blunt tip, shorter than the, generally several, rays; glumes generally pale below with dark reddish tips; anther 1.5 mm. long; achene surface smooth [20. *brachyceras*](#)
- Bract stem-like, generally exceeding the contracted inflorescence; anther 0.5 mm. long; achene surface transversely ridged [21. *sp. A*](#)
- 23** Spikelets solitary, one sessile and 3–4 stalked [3a. *angolensis* var. *brizaeformis*](#)
- Spikelets clustered: **24**
- 24** Achene with three equal sides and angles; leaves without blades; margin of glume smooth; anther 0.5 mm. long with a small, smooth connective-tip [16. *aureiglumis*](#)
- Achene with one or both sides flattened and only two acute angles; uppermost sheath sometimes producing a long blade; margin of glume minutely ciliate; anther connective-tip bristly: **25**
- 25** Stigmas 2; anther 0.8–1.5 mm. long; achene lenticular, $1.25-1.6 \times 1-1.2$ mm., transversely undulate but not ridged [15. *uninodis*](#)
- Stigmas 3; anther 0.25–0.6 mm. long; achene with one flat and one convex side, $0.95-1.2 \times 0.7-1.1$ mm., rugulose and ridged at least in the upper half [17. *lateriflorus*](#)

1. *Scirpus grandispicus* (Steud.) Berhaut in Bull. Soc. Bot. Fr. 100: 176 (1953), and Fl. Sén. ed. 2, 381, 369 (1967).

APD: Synonym of Bolboschoenus grandispicus (Steud.) Lewej. & Lobin

Isolepis grandispica Steud., Syn. Pl. Cyp. 318 (1855).

Resembling *S. maritimus* in its leafy stems and membranous, bifid, aristate glumes but with few broadly ovate spikelets, and lenticular achenes; depressions behind dunes near coast.

Sen.: Hann (June) Adam 12262! 17664! J. & A. Raynal 5965! Lac Retba (Apr.) Adam 17627! Nagelé 8107! Mboro (May) Adam 17660!

2. *Scirpus maritimus* Linn. Sp. Pl. 1: 51 (1753); F.T.A. 8: 455; Berhaut, Fl. Sén. ed. 2, 371 (1967).

APD: Synonym of Bolboschoenus maritimus (L.) Palla subsp. maritimus

Creeping perennial with leafy stems up to 1 m. high, bearing a bracteate corymb of large brown spikelets; **saline and semi-saline marshes.**

Maur.: Nagelé! Monod 7068! **Sen.:** Yankoba (June) J. & A. Raynal 5925! Richard-Toll Couey 6513! Walo (May) Roger! Lac Tanma (July) Berhaut 1101! M'bidjem Pitot! **Mali:** Mare de Buonankodjie (Feb.) Davey 56/CIPAS 444! Toubel (May) Davey 71! Tiouki to Selingourou (Feb.) Davey 22! Diré (Aug.) Lean 62! Gao (Apr.) de Wailly 5382!

Throughout tropical and temperate regions.

3. *Scirpus angolensis* C.B. Cl. in F.T.A. 8: 448 (1902).

APD: Synonym of Nenum angolense (C.B. Clarke) Larridon & Goetgh.

Tropical Africa.

3a. *Scirpus angolensis* var. *brizaeformis* (Hutch.) Hooper in Kew Bull. 26: 580 (1972).

APD: Synonym of Nenum spadiceum (Lam.) Desv. ex Ham.

Scirpus briziformis Hutch. in F.W.T.A., ed. 1, 2: 466 (1936); Berhaut, Fl. Sén. ed. 2, 364 (1967).
Eriocaulon spadiceum Lam., Ill. 1: 214 (1792).

Scirpus spadiceus (Lam.) Boeck. in Linnaea 36: 493 (1870); F.T.A. 8: 448; not of Linn.

Scirpus ustulatus Podl. in Mitt. Bot. 4: 117 (1961).

Slender tufted annual with stems 5–35 cm. high and reddish-black, papery-glumed spikelets; on damp rocks, in lateritic pans and in damp, grassy places.

Sen.: Niokolo-Koba (Dec.) J. & A. Raynal 6796! Tambacounda to Gouloumbo (Oct.) Pitot! Oussouye, Casamance (Nov.) Berhaut 6496! Kédougou (Nov.) Adam 20015! Kanéméré (Sept.) Aké Assi 5760! (Aug.) Boughey X279!

5. *Scirpus fluitans* Linn. Sp. Pl. 1: 48 (1753); F.T.A. 8: 449.

APD: Synonym of Isolepis fluitans (L.) R. Br. var. fluitans

Aquatic or semi-aquatic with weak floating or trailing many-noded stems; in or near water.

Mali: Gao to Berra (Mar.) de Wailly 5012b! **N. Nig.:** Nguroje, Mambila Plateau (Mar.) J. Hall 1630! **W. Cam.:** Bamenda, c. 5,000 ft. (Mar.) Coombe 228! Bali, 4,100 ft. (Apr.) Brunt 1056!

Also in the **Congo** and sporadically in east and S. Africa.

[Until the West African plant has been collected in fruit it is impossible to say the extent to which it differs from European and Asian *S. fluitans*, but it certainly does so in some respects, as the glumes and anthers appear to be shorter.]

6. *Scirpus setaceus* Linn. Mant. 2: 321 (1771); F.T.A. 8: 450.

APD: Synonym of Isolepis setacea (L.) R. Br.

Isolepis setaceus (Linn.) R. Br., Prod. 222 (1810).

Annual with filiform leaves and stems up to 10 cm. and a single dark, ovate, acute spikelet; damp grassland.

W. Cam.: Cam. Mt., Mann’s Spring, c. 9,500 ft. (Dec.) Morton K865! c. 8,000 ft. (Apr.) Morton GC 7065! Above Buea, 9,100 ft. (Apr.) Morton GC 6866!

Mountains of east Africa to S. Africa; also **Europe** and **Australia**.

7. *Scirpus isolepis* (Nees) Boeck. in Linnaea 36: 498 (1870); F.T.A. 8: 459; Berhaut, Fl. Sén. ed. 2, 360 (1967).

APD: Synonym of Lipocarpa hemisphaerica (Roth) Goetgh.

Hemicarpha isolepis Nees in Edinb. New Phil. Journ. 17: 263 (1834).

Annual with filiform leaves and stems to 15 cm., with one or two dark, elongate-ovate, obtuse, Lipocarpa-like spikelets; **damp grassland**.

Sen.: Leprieur 9. Perrottet. **Ghana:** Yapei Bridge, Tamale (Nov.) Hall & Enti GC 35730! **S. Nig.:** Agbaja (Feb.) J. Hall 829!

In **India** and **SE. Asia** and scattered throughout tropical and S. Africa

8. **Scirpus micranthus** Vahl. Enum. 2: 254 (1806); F.T.A. 8: 459; Berhaut, Fl. Sén. ed. 2, 361 (1967).

APD: Synonym of Lipocarpa micrantha (Vahl) G. C. Tucker

Resembling S. isolepis but having a small cluster of pseudolateral spikelets and oblanceolate, not broadly obovate, glumes.

Sen.: Mbao Berhaut 1186. Kayar (Oct.) J. & A. Raynal 6432!

Also in **Angola** and throughout America

9. **Scirpus kernii** Raymond in Nat. Canad. 86: 230 (1959); J. Raynal in Adansonia sér. 2, 8: 95 (1968).

APD: Synonym of Lipocarpa kernii (Raymond) Goetgh.

Scirpus squarrosus of F.T.A. 8: 458, partly; F.W.T.A., ed. 1, 2: 466; Berhaut, Fl. Sén. ed. 2, 368 (1967).

Stems 2–25 cm. long; somewhat stouter than Ascolepis dipsacoides which it resembles in the head of spikelets with squarrose glumes; **damp ground or marshes**.

Sen.: (Oct.) Fotius K569! Fatick (Dec.) J. & A. Raynal 6708! bis! Kaolak (Nov.) Berhaut 2622! Niokolo-Koba (Oct.) Adam 15561! 17018! Berhaut 4692! Vélingara (Oct.) Adam 18563! **Mali:** Kita Mts. (Nov.) Jaeger 3514! Sotuba (Oct.) Raynal 5028! **U. Volta:** Ouagadougou (Oct.) Nongonierma 202! **Ghana:** Tumu, Northern Prov. (Mar., May) Morton GC 7547! GC 8859! Tamale to Lumbaga (Dec.) Morton GC 6265! Yapei Bridge (Nov.) Hall & Enti GC 35841! 5 miles E. of Yendi (Sept.) Goodall GC 15846! **Togo Rep.:** Dapango (Oct.–Nov.) Bille TG 10! **Niger:** Niamey (Sept.) Cremers 952! **N. Nig.:** Shagunu, Ilorin (Oct.) J. Hall 1462! **S. Nig.:** Igboora, Oyo Dist. (Oct.) Haines 219! Agbaja (Nov.) J. Hall 832!

Also in **E. Cameroun** and eastwards to **Ethiopia**, about L. **Tanganyika** and in **India (Mysore)**.

10. **Scirpus mucronatus** Linn. Sp. Pl. 1: 50 (1753); F.T.A. 8: 454.

APD: Synonym of Schoenoplectus mucronatus (L.) Palla

Leafless rhizomatous perennial to 1.5 m. characterized by the sharply triangular stems and short stiff triangular bracts; **in swamps or open water**.

Guin.: Daralabé, Fouta Djallon (Jan.) Langdale-Brown 2575! (Apr.) Chev. 12341! Labé (Apr.) Pitot! Pita (Dec.) Pobéguin 2191! Mamou (May) Pitot! **N. Nig.:** Mandaga, Mambila Plateau, 6,000 ft. (Jan.) Latilo & Daramola FHI 29000! J. Hall 1692! **W. Cam.:** Bamenda (Mar.) Morton K159!

Also in **E. Cameroun**, central, east and south Africa and widespread in the temperate and tropical regions of the Old World.

11. **Scirpus articulatus** Linn. Sp. Pl. 1: 47 (1753); F.T.A. 8: 453.

APD: Synonym of Schoenoplectiella articulata (L.) Lye

APD: Synonym of Schoenoplectiella senegalensis (Hochst. ex Steud.) Lye

A rush-like plant with spongy rounded septate stems and a pseudolateral cluster of large acute spikelets; **in or near standing water**.

Ghana: Accra (Apr.) Hall 3458! Accra to Ada (Dec.) Morton 6324! Dawa, nr. Ada (Dec.) Adams 3618! **Niger:** Zinder (Oct.) Hagerup 588! **N. Nig.:** Katagum Dalz. 242! Fadama, Dikwa Dist. (Nov.) Davey FHI 27105! Bama, Dikwa Dist. (Dec.) McClintock 115!

Also in **E. Cameroun**, **Chad**, from the **Sudan** to the Cape, in Madagascar and intermittently throughout the Old World tropics.

There is a Leprieur specimen marked as from the Senegal River, but the species has not been recently recorded from Senegal.

[The typical Indian plant has an obtuse and minutely apiculate glume whilst the glume is acute and apiculate or acuminate in specimens from Africa.]

12. *Scirpus jacobii* C. E. C. Fischer in Kew Bull. 1931: 103.

APD: Synonym of Schoenoplectiella senegalensis (Hochst. ex Steud.) Lye

Scirpus praelongatus of authors, not of Poir. (1804); F.W.T.A., ed. 1, 2: 466; Berhaut, Fl. Sén. ed. 2, 361 (1967).

***Isolepis senegalensis* Hochst. ex Steud.**, Syn. Pl. Cyp. 96 (1855), not *Scirpus senegalensis* Lam. (1791).

Similar to the preceding species in the septate stems and pseudolateral inflorescence but much more slender with smaller, catkin-like, often very obtuse spikelets; edge of standing water, marshes, temporary pools on laterite.

Maur.: Aleg (Sept.) Baron 57! **Aleg!** **Sen.:** Heudelot 319! L. Tanma (Nov.) Pitot! Richard Tol (Feb.) Dollinger 13! Ourosogui to Matam (Dec.) Naegelé 13162! Also in **Mauritania**, **Chad** and **Congo**, intermittently through east Africa and **Angola** to S.W. Africa and in **India**.

[The African collections are characterized by smaller glumes and spikelets than the Indian.]

14. *Scirpus oxyjulos* Hooper in Kew Bull. 26: 581 (1972).

APD: Synonym of Schoenoplectus oxyjulos (S.S. Hooper) J. Raynal

Tufted rush-like plant 15–35 cm. high with spikelets tapering to an acute point and long prominent erect bracts; **rock pools or wet flushes on inselbergs.**

Guin.: Thianguel-Bori (Oct.) Pitot! Telimélé (Oct.) Pitot! **S. L.:** Kambia to Kukuna (Dec.) Morton & Gledhill SL 27! **N. Nig.:** Anara F.R. (Oct.) Keay FHI 20127! Kufena Hill, Zaria, 2,300 ft. (Sept.) Clayton 1323! Kershaw 420! Dumbi inselberg, Zaria (Sept.) Kershaw 422!

Also in **E. Cameroun**, **C. African Rep.** and **Sudan**.

15. *Scirpus uninodis* (Del.) Boiss. Fl. Or. 5: 380 (1884).

APD: Synonym of Schoenoplectiella lateriflora (J.F. Gmel.) Lye subsp. lateriflora

APD: Synonym of Schoenoplectus erectus (Poir.) Palla ex J. Raynal subsp. erectus

Isolepis uninodis Del., Fl. Égypte 8, t. 6 fig. 1 (1813).

Scirpus supinus var. *uninodis* C.B. Cl. in Hook. f., Fl. Brit. Ind. 6: 656 (1894); F.T.A. 8: 453.

Tufted annual, generally less than 30 cm. high with a generally sessile cluster of few pseudolateral spikelets with dark red-tipped glumes; [edge of lakes and swamps](#).

Sen.: Naegelé s.n.! 4994! Dakar Adam 17655! **Mali:** Gao to Berra (Mar.) de Wailly 5006! **N. Nig.:** L. Chad, Bornu Prov. (Mar.) Jackson 2574!

Also in [Egypt](#) and [Sudan](#).

16. *Scirpus aureiglumis* Hooper in Kew Bull. 26: 581 (1972).

APD: Synonym of Schoenoplectiella juncea (Willd.) Lye

Schoenus junceus Willd., Phyt. 1: 2, t. 1, 4 (1794), not *Scirpus junceus* Forst. f. (1786).

Scirpus supinus of F.T.A. 8: 452, partly.

Tufted annual up to 60 cm. with soft rounded stems and bracts, leaves reduced to sheaths and spikelets often golden at maturity; [margin of ponds and swamps](#).

Sen.: Walo Leprieur! Kolda to Salikenié Trochain 1330! **Guin.:** Koba Jac.-Fél. 7248! **Iv. C.:** Néro-Mer, nr. Béréby (Nov.) Oldeman 520! Throughout tropical Africa and America.

Doubtful species.

Scirpus verruculosus (Nees) Steud. in Flora 12: 145 (1829); F.W.T.A., ed. 1, 2: 466; Berhaut, Fl. Sén. ed. 1, 215, 217 (1954), and ed. 2: 361 (1967). *APD acc*

The two records for the occurrence of this S. African species in the Flora area are doubtful; Leprieur's specimen in the Paris herbarium does not, as normally, bear an original label and Berhaut's specimen is not present in Paris.

8. ELEOCHARIS

R. Br., Prod. Fl. Nov. Holl. 224 (1810); F.T.A. 8: 404 (1902).

Heleocharis of many authors.

- 1 Plants aquatic or semiaquatic with weak, often floating capillary stems, often many sterile; spikelets small, more or less flattened with few glumes:2
Plants normally terrestrial with most stems erect and fertile; spikelets terete, not acuminate, producing many achenes:5
- 2 Plants aquatic, submerged but for the flowering stems; sterile stems borne in clusters; spikelets acuminate, composed of up to 8 lanceolate glumes; achene with an acuminate style-base as tall as or taller than broad: ..3
Plants semi-aquatic; spikelets 1.5–2 × 0.75–1 mm., elliptical, acute; glumes obtuse; achene with a clear quadrate surface pattern and depressed style-base broader than tall [3. brainii](#)
- 3 Spikelets composed of 2–3 glumes producing 1 achene 1. naumanniana.....4
.....@
Spikelets composed of 6–8 glumes producing 2–4 achenes; stems not septate [2. subtilissima](#)
- 4 Spikelets 4–5 mm. long; floating stems clearly septate [1a. naumanniana var. naumanniana](#)
Spikelets 1.5–3 mm. long; floating stems not, or only obscurely, septate [1b. naumanniana var. caillei](#)
- 5 Spikelets ovate, oblong or spherical, up to 1 1/2 times as long as broad; plants small to medium-sized:6
Spikelets cylindrical, twice or more as long as broad; generally at least 2 cm. long; plants large: 12
- 6 Achene trigonous; stigmas 3:7
Achene lenticular; stigmas 2: 10
- 7 Stems capillary; spikelets small, few-flowered:8
Stems flattened, ridged, 1–1.5 mm. thick, 10–25 cm. high, arising in tufts from a more or less distinct rhizome; spikelets ovate, about 5 mm. long; glumes obtuse with a wide membranous edge and distinct keel; achene with three clear angular ridges [6. complanata](#)
- 8 Achene about 0.75 × 0.5 mm. with a clear surface pattern and depressed style-base; stems often submerged ...[3. brainii](#)
Achene with a faint or no surface patterning:9
- 9 Achene 1 mm. long; glumes reddish [4. trilophus](#)
Achene 0.65–0.7 mm. long; glumes pale [5. setifolia](#)
- 10 Achene dark red or black: 11
Achene greenish yellow; spikelets narrowly ovoid or elliptical, greenish; achene about 1 mm. long with white bristles [9. deightonii](#)
- 11 Stems about 1 mm. thick; basal sheaths conspicuous, purple below, white above; spikelets broadly ovoid, about 5

mm. long, subglobular when young; achene about 1 mm. long, bristles pink, longer than the achene or absent [7. geniculata](#)

Stems less than 0.5 mm. thick; spikelets ovoid or elliptic about 2 mm. long; achene about 0.5 mm. long; bristles white, shorter than the achene or absent [8. atropurpurea](#)

- 12** Stems terete, spongy, septate, up to 1 cm. thick; sheaths greyish or purple, shining, papery; spikelet not exceeding stem in width; glumes with a single prominent nerve; surface of the achene almost smooth [10. dulcis](#)

Stems angular, or if terete not exceeding 5 mm. thick, not spongy and septate: **13**

- 13** Margin of the glume with a distinct dark band; glume 2×1.25 mm.; achene turbinate with quadrate surface pitting [11. decoriglumis](#)

Margin of the glume membranous, sometimes dotted or streaked with red; achene longitudinally striate, the surface pitting horizontally elongated and arranged in vertical rows: **14**

- 14** Achene markedly constricted above with a neck narrower than the style-base; style-base acute, taller than broad; glumes generally oblong and clearly nerved; stems sharply trigonous with concave faces [12. acutangula](#)

Achene slightly constricted above with a wide neck surrounding the style-base: **15**

- 15** Glumes close-packed, orbicular to obovate, obscurely nerved; striations on the achene fine; generally in brackish coastal swamps [13. mutata](#)

Glumes oblong, clearly several-nerved; achene clearly striate; stems slender, generally terete or obscurely angled: **16**

- 16** Achene 2.3–2.8 mm. long (including style-base) with bristles as long as itself; outer layer of surface cells transparent; style-base as tall or taller than broad [14. variegata](#)

Achene 1.7–2.1 mm. long with bristles much shorter; style-base broader than tall [15. nupeñsis](#)

- 1. *Eleocharis naumanniana* Boeck.** in Engl., Bot. Jahrb. 5: 92 (1884); F.T.A. 8: 411; Svenson in Rhodora 34: 253, t. 461, fig. 6 (1932). *APD acc*

- 1a. *Eleocharis naumanniana* var. *naumanniana*** —Nelmes and Baldwin in Amer. J. Bot. 39: 373 (1952). *APD acc*

Eleocharis testui of Berhaut, Fl. Sén. ed. 2, 11, 360, 363.

Generally aquatic, forming mats of numerous slender clustered stems, sometimes terrestrial and sterile; [in or near open water](#).

Sen.: Diantème (Oct.) Kerharo & Adam s.n. (H.F.M.P. (Dakar) 1561)! Nioro du Rip (Nov.) Berhaut 1802! Oussouye, Casamance (Mar.) Berhaut 7229! Tambana, Casamance (Feb.) - 2. *Eleocharis subtilissima* Nelm** in Kew Bull. 6: 422 (1952); Nelm and Baldwin in Amer. J. Bot. 39: 375, tt. 26–39 (1952).

APD: *Synonym of Eleocharis retroflexa subsp. subtilissima (Nelm) Lye*

Differing from the foregoing aquatic species in producing more than one achene per spikelet and having a three-lobed style-base; **in or at the margin of open water.**

Mali: Macina (Nov.) Duong! **Guin.:** Siguiri (Nov.) Jac.-Fél. 1355! Friguiagbé (Nov.) Chillou 835! 893! **S. L.:** Mafufui, nr. Mateboi (Nov.) Jordan 838! 839! **Lib.:** Monrovia (Nov.) Dinklage 3272!

Also in the **Congo.**

[Very close to the Indian *E. retroflexa* (Poir.) Urb. (*E. chaetaria* Roem. & Schult.) from which it differs only in the slender habit, frequent presence of sterile stems, the narrower more acute glumes and somewhat smaller achene and style-base.]

3. **Eleocharis brainii** *Svenson* in *Rhodora* 39: 251, t. 461, fig. 4 (1937); J. & A. Raynal in *Adansonia sér.* 2, 7: 318 (1967). *APD acc*

Semi-aquatic annual with numerous slender stems and very small elliptical spikelets; flooded **savanna.**

Sen.: Badi to Siminti (Dec.) J. & A. Raynal 6997b! **Guin.:** Kiffaya to Sériba (Oct.) Pitot! **Ghana:** Busunu, Damongo to Yapei (Sept.) Hall CC 891! Yendi to Zalazugu (Dec.) Morton A1463! **N. Nig.:** Basita, nr. Jebba, Ilorin Prov. (Feb.) Clayton 1508 (FHI 42003)!

Also in E. **Cameroon**, **C. African Rep.** and **east Africa** and **south-east Africa.**

4. **Eleocharis trilophus** *C. B. Cl.* in *Fl. Trop. Afr.* 8: 409 (1902); *Svenson* in *Rhodora* 34: 253, t. 462, fig. 10 (1932). *APD acc*

Small tufted annual up to 10 cm. high with red-purple sheaths and elliptical red-purple glumed spikelets about 2.5 × 1 mm.; ground subject to flooding.

Sen.: Roger 113a! Podor to Guédé (Dec.) Martine 35! Thillé to Boubacar (Dec.) Naegelé 13124! Ndoum (Dec.) Naegelé 13105!

Also in **E. Cameroun** and **Congo.**

[Perhaps conspecific with the American *E. minima* Kunth from which it differs only in the somewhat larger glumes and achene.]

5. **Eleocharis setifolia** (*A. Rich.*) *J. Raynal* in *Adansonia sér.* 2, 7: 318 (1967). *APD acc*

Isolepis setifolia *A. Rich.*, Tent. Fl. Abyss. 2: 498 (1851).

Eleocharis schweinfurthiana *Boeck.* in *Flora* 62: 562 (1879); F.W.T.A., ed. 1, 2: 468.

Eleocharis microcarpa of *C.B. Cl.* in F.T.A. 8: 410

Slender, tufted plant with neat, elliptical spikelets 2–3 mm. long of pale to golden membranous glumes; **damp places on rocks and in grassland.**

Sen.: (Sept.) Fotius 399! Tambacounda (Sept.) Berhaut 1538! Tambacounda to Sambailo (Sept.) Pitot! Sambailo (Oct.) Pitot! **Mali:** Ouolo Kourou Mountain (Aug.) Jaeger 7! Bamako to Ségou (Sept.) Also in **Chad**.

[A taxon of doubtful status whose relationship to the West Indian *E. mitrata* (Griseb.) C.B. Cl. and to *E. variegata* and *E. acutangula* needs further study.]

9. WEBSTERIA

S. H. Wright in Bull. Torr. Bot. Club 14: 135 (1887).

- 1 Submerged aquatic with long slender weak stems producing tufts of increasingly short and slender, finally capillary, radiating stems of the first second and sometimes third order, surrounded at the base by membranous purple sheaths; spikelets emergent, linear, acute, about 1 cm. long, of two large purple and green glumes surrounding a single achene; anthers 3, large, about 4 mm. long; achene obovate with a distinct beak bearing the slightly enlarged style-base[confervoides](#)

Websteria confervoides (Poir.) Hooper in Kew Bull. 26: 582 (1972). *APD acc*

Scirpus confervoides Poir., Encyc. Méth. 755 (1804).

Rhynchospora ruppioides Benth. in Hook. f., Icon. Pl. 14, t. 1344 (1881).

A green, floating, alga-like plant, most closely resembling *Eleocharis naumanniana* in the single-flowered, soft, flattened spikelet; [in running water](#).

Iv. C.: Moossou (Dec.) Hallé & Guillaumet! Abouabou (Mar.) J. & A. Raynal 13650! **S. Nig.:** Sapoba (Sept.) Onochie in FHI 34310!

The genus, which is probably monotypic, also occurs in the **Congo**, **Tanzania**, **Zambia**, **Madagascar**, **Ceylon** and intermittently in the New World tropics.

10. BULBOSTYLIS

Kunth, nom. cons; C.B. Cl. in Hook. f., Fl. Brit. Ind. 6: 651 (1893); F.T.A. 8: 427 (1902).

- 1 Spikelets sessile, inflorescence capitate:2
Spikelets pedicellate, solitary or few to numerous in a spreading inflorescence:9
2 Spikelets large, 10–15 mm. long, up to 10 in the head; plants with a clearly woody base:3

- Spikelets small, less than 10 mm. and generally less than 5 mm. long, generally numerous in a spherical or hemispherical head; plants tufted, rarely somewhat woody:4
- 3 Spikelets flattened, the glumes distichous or nearly so; leaves reduced to bladeless or shortly bladed, pilose, green sheaths bearded at the mouth; stems sharply angular or ridged; glumes brown to dark red, long acuminate, apiculate; achene obovate [1. pilosa](#)
- Spikelets terete; sheaths glabrous or puberulent, bright red; glumes black or blackish, obtuse or apiculate; achene elliptical [2. erratica](#)
- 4 Inflorescence greenish- or golden-brown; leaves and bracts capillary; leaf-sheaths pale, membranous; glumes hairy, boat-shaped with a clear green keel prolonged into a recurved apiculus [3. barbata](#)
- Inflorescences black or red-brown; basal sheaths reddish:5
- 5 Inflorescence spherical, reddish brown when mature; long crimped brown or white hairs at mouth of sheath and on bracts; spikelets distinctly flattened, ovate, few-flowered; glumes hairy, more or less distichous:6
- Inflorescence hemispherical, black or dark brown; densely tufted plants with filiform leaves; spikelets terete, angular or slightly flattened, more or less cylindrical:7
- 6 Slender annual up to 20 cm. high; leaves capillary; inflorescence about 5 mm. across, occasionally up to 8 mm.; glumes lanceolate, acuminate, ciliate on the margin; achene about 0.4 × 0.3 mm. [4. fimbriatylodes](#)
- Perennial up to 50 cm. high; inflorescence about 10 mm. across; glumes ovate, acute, slightly ciliate on the margin; achene 0.85–1.0 × 0.6–0.7 mm. [5. laniceps](#)
- 7 Stems beneath inflorescence hispid or tomentose with robust upwardly directed hairs; spikelets angular, distinct; glumes broadly ovate, boat-shaped with a short recurved apiculus; achene broadly elliptic, yellow to brown with a pale broad, generally obtuse, style-base 0.2–0.3 mm, across and slightly rugulose sides [6. scabridicaulis](#)
- Stems beneath inflorescence smooth or somewhat scabrid; spikelets crowded; achene obovoid, trigonous with a small conical style-base and papillate sides:8
- 8 Stems robust, about 1.5 mm. thick; sheaths brown, conspicuously hairy at mouth; glumes lanceolate, at least the lower with a straight or nearly straight keel [7. metralis](#)
- Stems usually not exceeding 1.0 mm. thick; sheaths not conspicuous; glumes ovate with a distinct curved apiculate keel [8. filamentosa](#)
- 9 Spikelets large, about 8 × 3 mm., solitary, brown; glumes obtuse, hairy, ciliate on the margin [9. bodardii](#)
- Spikelets smaller than above, more than one (rarely reduced to one): 10
- 10 Plant with a rhizome composed of swollen stem-bases and covered with brown acute scales; sheaths red; leaf-blades reduced; spikelets 1–5, black [10. oritrephes](#)
- Plant tufted, without a rhizome: 11
- 11 Spikelets less than ten-flowered, in a simple umbel; bracts leafy, one at least up to twice as long as the peduncles; stems and numerous leaves generally hairy; sheaths red, often disintegrating into a mass of red-brown fibres; achene 1.25–1.5 mm. long; style-base small, easily detached [11. lanifera](#)
- Spikelets numerous in a spreading panicle, or if few, then without the above combination of characters: 12
- 12 Perennial, plant tufted; bracts with conspicuous dark bases and short green tips; spikelets 5–6 × 2 mm., reddish-black; glumes acute with a single slender nerve and pale margins; achene surface transversely ridged [12. guineensis](#)
- Annual or apparently so; bracts without conspicuous dark bases: 13
- 13 Inflorescence contracted with most of the spikelets on short pedicels; glumes with a well-marked keel excurrent in a sharp acumen [16b. densa var. cameroonensis](#)
- Inflorescence diffuse with most of the spikelets on spreading pedicels longer than themselves; glumes obtuse or mucronate, with the keel not or hardly excurrent: 14
- 14 Upper spikelets broadly ovate with several lanceolate, aristate, white-fringed persistent bracteoles at the base; glume often with a dark spot towards the tip [13. coleotricha](#)
- Upper spikelets elliptical to ovate with a single, usually inconspicuous empty bracteole at the base : 15
- 15 Stem tomentose; sheaths pinkish; bracts red-brown, shortly hairy; achene obovate to obcordate, transversely undulate, sharply trigonous [14. congolensis](#)
- Stems glabrous or sparsely and shortly hairy: 16
- 16 Bracts fringed with long white hairs (sometimes only sparsely so in small specimens); glumes glabrous, 3-nerved with a membranous margin; achene with quadrate surface cells raised in the centre to give a papillate appearance, the papillae being arranged more or less in vortical rows [15. abortiva](#)
- Bracts not fringed; generally small plants less than 20 cm. high; glumes hairy; achene with vertically elongated surface cells, papillate in the centre and raised to produce a transversely undulate appearance of the achene surface: 17
- 17 Spikelets ovate to broadly elliptic; glumes broadly ovate, clearly keeled [16a. densa var. densa](#)

Spikelets narrowly elliptic to cylindric; glumes lanceolate, appressed, weakly keeled [17. pusilla](#)

1. **Bulbostylis pilosa** (Willd.) Cherm. in Bull. Soc. Bot. Fr. 81: 266 (1934), and 82: 341 (1935); Bodard in Ann. Fac. Sci. Dakar 9: 61 (1963). *APD acc*

Also in **Chad**, **C. African Rep.** and **Ethiopia**.

11. FIMBRISTYLIS

Vahl, Enum. 2: 285 (1806); F.T.A. 8: 411 (1902).

Abildgaardia *Vahl*, Enum. 2: 296 (1806).

- 1 Achene oblong-cylindric, smooth; small slender annual up to 10 cm. high; inflorescence of 1–3 ovoid spikelets on long peduncles and a central sessile one; spikelets 2–4 mm. long, 2 mm. wide; glumes with long awns, crowded [1. dipsacea](#)
- Achene orbicular to obpyriform, trigonous or biconvex, the surface variously ornamented or smooth: **2**
- 2 Stigmas 2; style flat, usually ciliate; achene biconvex; glumes always spirally arranged: **3**
- Stigmas 3; style trigonous, bearded or glabrous; achene trigonous, glumes spirally arranged or distichous: **15**
- 3 Style-base with a fringe of long hairs pendant over the upper part of the achene; slender annual up to 15 cm. high with numerous green to buff narrowly oblong spikelets up to 6 mm. long, 1.5–2 mm. wide; glumes scarious with a conspicuous recurved awn [2. squarrosa](#)
- Style-base not fringed: **4**
- 4 Achene striate with 5–9 ribs, obpyriform; style compressed, bearded above: **5**
- Achene tuberculate, smooth or faintly striolate with numerous faint lines (about 15) usually almost circular in outline, rarely obovate; style compressed and usually bearded or terete and glabrous: **7**
- 5 Spikelets linear-oblong 1.2–1.6 mm. wide; small annual with generous inflorescence of brown spikelets; glumes boat-shaped and sharply keeled with 1 vein in the keel [3. bisumbellata](#)
- Spikelets ovoid to lanceolate, 1.5–4.5 mm. wide; a very variable perennial or annual with large spreading inflorescence; glumes convex, rounded on the back with about 3 veins visible in the green keel area: **6**
- 6 Spikelets 3–6 mm. long and not above 3 mm. wide; annual or perennial with culms 2.5 mm. or more wide at the base and soft leaves; glumes 2–2.4 mm. long [4a. dichotoma var. dichotoma](#)
- Spikelets very large and somewhat inflated, 6–10 mm. long and 3–4.5 mm. wide; stout rhizomatous perennial with fibrous base and few to many spikelets; glumes greyish to light brown, up to 3.5 mm. long [4b. dichotoma var. laxa](#)
- 7 Glumes glabrous or with a sparse scattering of short hairs: **8**
- Glumes with a very dense and conspicuous grey pubescent patch in the upper third; stout perennial [9. ferruginea](#)
- 8 Spikelets 1.5–2.8 mm. wide, never hairy; rhachilla very narrow, 0.5–0.6 mm. wide; achenes never granular: .. **9**
- Spikelets 2.8–4 mm. wide, glabrous or sparingly hairy; rhachilla 0.8–1 mm. wide; achenes smooth, striolate or granular: **11**
- 9 Spikelets oblong-lanceolate, 1.8–3 mm. wide, 7–12 or more per inflorescence; achene faintly striolate to almost smooth or with a few tubercles, usually dark when ripe [4c. dichotoma var. pluristriata](#)
- Spikelets lanceolate 1.5–2.5 mm. wide, 1–5 or, rarely, up to 10 per inflorescence; slender annuals with rigidly erect solitary or tufted stems and narrow leaves not over 1.5 mm. wide: **10**
- 10 Achenes not striate, smooth with scattered tubercles especially on the thickened margins and near the apex, surface cells thin-walled, elongate [5. alboviridis](#)
- Achenes faintly pluristriate with up to 15 ribs, rarely with tubercles, surface cells thick-walled, square or almost so [6. striolata](#)
- 11 Annual or perennial up to 75 cm. high; glumes broadly ovate, obtuse, mucronate: **12**
- Stout perennials 25–60 cm. high, or more; rhizomes thick with bulbous stem-bases coated with fibrous sheath remains; glumes broadly lanceolate, acute or obtuse, mucronate: **13**
- 12 Glumes with conspicuous dark chestnut brown or black lateral patches, otherwise pale green, veins crowded into the keel; spikelets usually 3–9 per inflorescence [7. pilosa](#)
- Glumes pale greenish cream throughout, veins fairly evenly spaced across the back; spikelets solitary, rarely 2–3 per inflorescence [8. schoenoides](#)
- 13 Glumes acute, dark chestnut with a dark grey-green excurrent keel: **14**
- Glumes obtuse, light yellowish brown or ferruginous, with an obscure keel scarcely excurrent [13. chevalieri](#)

- 14 Pedicels straight or almost so, erect; achenes finely punctate, black at maturity [10. nigritana](#)
 Pedicels long, flexuous, mostly curving outwards and downwards; achenes finely granular, dark brown at maturity [11. barteri](#)
- 15 Glumes spirally arranged: 16
 Glumes distichous: 29
- 16 Inflorescence of 2—many pedicellate spikelets: 17
 Inflorescence of clusters of numerous sessile spikelets [21. obtusifolia](#)
- 17 Cauline leaves with well developed leaf-blades; stems more or less terete or strongly compressed and 2-angled: 18
 Cauline leaves reduced to the sheath only or with a very short blade; basal leaves well developed or absent; stems strongly 4–5 angled at the top: 27
- 18 Achene with transverse wavy ridges or undulations; leaves filiform or very narrow; stem ribbed at the top; plant usually with scattered fine long white hairs: 19
 Achene tuberculate or vertically ribbed; leaves filiform or flat; plant never with scattered fine long white hairs: 23
- 19 Spikelets 3–5 mm. long, numerous; glumes ferruginous with a long mucro, pubescent [24. cioniana](#)
 Spikelets 5–8 mm. long, rarely more than 12 to an inflorescence and usually many fewer; glumes acute or shortly mucronate, pubescent or glabrescent: 20
- 20 Achenes obpyriform, yellowish, undulations not very pronounced or the achene almost smooth: 21
 Achenes elliptic-ovoid, white, with narrow-crested transverse ridges; annual or perennial; glumes 3.8–4.5 mm. long, acute, ferruginous with dark brown close to the green keel, glabrous [26. tisserantii](#)
- 21 Glumes 2–3.5 mm. long, mucronate or acute, dark chestnut with a green keel or rarely ferruginous: 22
 Glumes 3.8–4.5 mm. long, acute, ferruginous, rarely dark chestnut with a green keel, pubescent; rigid perennial [25b. hispidula subsp. brachyphylla](#)
- 22 Achene with 10–12 transverse undulations; slender annual; glumes dark, acute, 2–2.5 mm. long . [25c. hispidula subsp. senegalensis](#)
 Achene with 6–8 transverse undulations; annual or perennial; glumes dark or ferruginous shortly mucronate, 2.5–3.5 mm. long [25a. hispidula subsp. hispidula](#)
- 23 Stem ribbed or terete at the top; spikelets small, more or less oblong to narrowly lanceolate; 24
 Stem compressed, flattened and acutely 2-keeled at the top: 26
- 24 Perennial with swollen creeping rhizomatous bases with a thick coating of old leaf-sheath bases: 25
 Annual, or perennial with a slender rhizome; leaf-blades filiform or up to 1 mm. wide; spikelets ovoid, greenish white or tinged with light chestnut, few; glumes sub-acute with or without a short mucro [15. debilis](#)
- 25 Plants stout; leaves 1–4 mm. wide; inflorescence with numerous spikelets (12 or more); glumes dark, acutely keeled, acute [12. scabrida](#)
 Plants slender; leaves not over 0.5 mm. wide; inflorescence with 2–6 brown spikelets; glumes brown, acutely keeled, obtuse [14. schweinfurthiana](#)
- 26 Slender densely leafy annual with small, linear-lanceolate spikelets up to 1.2 mm. wide; rhachilla narrow, less than 0.6 mm. wide; glumes ferruginous, 1–1.5 mm. long [16. thonningiana](#)
 Densely leafy annual with spikelets 1.5–2.5 mm. wide; rhachilla 0.7–1 mm. wide; glumes 2–2.8 mm. long . [17. complanata](#)
- 27 Spikelets small and very numerous, globose; slender or robust leafy annual [18. littoralis](#)
 Spikelets ovoid to lanceolate; tufted perennials: 28
- 28 Basal leaves few to many, always with a well-developed blade [19. quinquangularis](#)
 Basal leaves absent [20. aphylla](#)
- 29 Inflorescence a solitary pale yellowish green spikelet; achene trigonous, granular-tuberculate [22. ovata](#)
 Inflorescence of 2–5 spikelets; achene smooth or almost so with an exceptionally long stipitate base [23. triflora](#)

1. **Fimbristylis dipsacea** (Rottb.) C.B. Cl. in Hook. f., Fl. Brit. Ind. 6: 635 (1893); F.T.A. 8: 413. *APD acc*

Scirpus dipsaceus Rottb., Desc. & Ic. 56, t. 12, f. 1 (1773).

Minute ephemeral herb with small green spikelets not over 4 mm. long; glumes scarious with the green midvein excurrent in a long awn; sandy places and swamps, also on laterite outcrops.

Mali: L. Korienza (Apr.) Duong 2148! 2152! Gao to Bagoundié (June) de Wailly 5061! **S. L.:** Kambia (May) Jordan 866! Rokupr (Apr.) Adames 170a!

Widespread in tropical regions.

2. **Fimbristylis squarrosa** *Vahl* Enum. 2: 289 (1805); F.T.A. 8: 413; Berhaut, Fl. Sén. ed. 2, 370. *APD acc*

Small annual herb with green to buff-coloured oblong spikelets, glumes scarious with a conspicuous green midvein excurrent in a long recurved awn; in sandy river-beds and swamps.

Sen.: Sangalkam (June) Berhaut 5266! Kayar (Apr.) Naegelé 8086! Ourosogui to Matam (Feb.) Naegelé 12117! Dougar (Jan.) Berhaut 5652! Niokolo-Koba (Feb.) Adam 17539! **Mali:** Néguebougou, nr. APD: *Synonym of Fimbristylis bisumbellata (Forsk.) Bubani*

Scirpus dichotomus *Linn.*, Sp. Pl. ed. 2, 74 (1762).

S. diphyllus *Retz.*, Obs. 5: 15 (1788).

Fimbristylis diphylla (*Retz.*) *Vahl*, Enum. 2: 289 (1805); F.T.A. 8: 415.

4a. **Fimbristylis dichotoma** var. **dichotoma** *APD acc*

Tufted perennial or annual up to 1 m. high but very variable in stature with wide scarious-margined basal leaf-sheaths and numerous glabrous or sparingly hairy leaves. Inflorescence of numerous light brown to chestnut narrowly ovate or lanceolate spikelets 3.5–6 mm. long, rarely longer, with shallowly convex green-keeled glumes; damp grassland and savanna, stream banks and swamps.

In all tropical areas of the world.

4b. *Fimbristylis dichotoma* var. *laxa* (Vahl) Napper in Kew Bull. 25: 436 (1971).

APD: *Synonym of Fimbristylis dichotoma (L.) Vahl*

Fimbristylis laxa Vahl, Enum. 2: 292 (1805).

Fimbristylis diphylla var. *laxa* (Vahl) E. G. Camus in Lecomte, Fl. Gén. Indochine 7: 104 (1912).

Fimbristylis dichotoma of F.T.A. 8: 414, in small part.

A much stouter perennial than the type variety, with the sheath-bases becoming hard and the stem-bases frequently surrounded by fibres; inflorescence with few to many light brown to greyish spikelets 6–9 mm. long, 3–4.5 mm. wide and usually plumper than the species; **swampy, damp grasslands and plantations.**

Sen.: Kolda (Oct.) Adam 18472! **Guin.:** Friguiagbé (Apr., May) Chillou 136! 447! Farana (Mar.) Sc. Elliot 5355! **S. L.:** Sulima (May) Deighton 5781! Yonibana (Jan.) Glanville 133! Sendugu (June) Thomas 601! Samaia (May) Thomas 235! **S. Nig.:** Igbetti to Ogbomosho (Aug.) Stanfield!

Almost as widely spread as the type variety but much less frequent in occurrence in Africa, though in parts of the east it may be the more abundant.

4c. *Fimbristylis dichotoma* var. *pluristriata* (C.B. Cl.) Napper in Kew Bull. 25: 437 (1971).

APD: *Synonym of Fimbristylis tomentosa Vahl*

Fimbristylis diphylla var. *pluristriata* C.B. Cl. in Hook. f., Fl. Brit. Ind. 6: 637 (1893).

Fimbristylis podocarpa Nees in Wight, Contrib. 98 (1834); Berhaut, Fl. Sén. ed. 2, 371.

Fimbristylis pluristriata (C.B. Cl.) Berhaut in Bull. Soc. Bot. Fr. 101: 376 (1955), illegitimate name.

An annual differing from similar states of the species by the almost orbicular achene with numerous faint striae, otherwise identical; **damp grassy places, stream-banks, etc.**

Gam.: (Aug.) Ruxton 80! **Sen.:** M'Bao (Nov.) Adam 2311! Oussouyé (Oct.) Kerharo & Adam 1564! Casamance (Oct.) Adam 18587! **Mali:** Kita (Sept.) Jaeger 71! 74! Samanko, nr. Bamako (Jan.) J. & A. Raynal 5418! **Guin.:** Koba (Nov.) Jac.-Fél. 7251! **S. L.:** Waterloo (Aug.) Melville & Hooker 297! Rokupr (July) Jordan 51! Konta (Sept.) Jordan 106! Loma Mts. (Aug.) Jaeger 7224! Madina (Aug.) Jordan 911! **Ghana:** Oti R. nr. Kpandai (Aug.) Hall GC 38730! Yendi (Dec.) Adams & Akpabla 4094! Lumbaga to Tamale (Dec.) Morton GC 6266! Dedoro to Tankara (Dec.) Adams & Akpabla 4330! **N. Nig.:** Birnin Gwari (Apr.) Meikle 1383! Naraguta F.R., Jos (July) Lawlor & Hall 107! Damaturu, Bornu Prov. (Sept.) De Leeuw 1211b! **S. Nig.:** Okelifi, Ondo Dist. (Nov.) Onochie FHI 34225!

Widespread with the type variety and frequently not separated from it.

[The taxonomy of this widespread and very variable species poses many problems. The varieties deemed here seem a natural division of the West African material though a few anomalous intermediates have been observed. Much work remains to be done on a wider basis especially in field observation and experimentation before a proper understanding of the variability can be obtained.]

5. *Fimbristylis alboviridis* C. B. Cl. in Fl. Brit Ind. 6: 638 (1893); Napper in Kew Bull. 25: 437 (1971).

APD acc

Fimbristylis diphylla var. *tuberculata* Cherm. in Bot. Arch. Caen 4, Mém. 7: 31 (1931).

Fimbristylis pluristriata var. *tuberculata* (Cherm.) Berhaut in Bull. Soc. Bot. Fr. 101: 376 (1955), invalidly published.

Fimbristylis podocarpa Nees var. *tuberculata* (Cherm.) Berhaut, Fl. Sén. ed 2, 371, name only.

Slender narrow-leaved annual differing from *F. dichotoma* in the more rigid habit, the fewer spikelets, the smaller glumes marked with dark chestnut brown and the very characteristic suborbicular achene having few to several vertical rows of cells lacking the raised ribs, but with a thick tuberculate rim and scattered tubercles on the sides; **swampy places and river banks, also damp grassland and rocky places.**

Sen.: Berhaut 630; 2606. **Guin.:** Friguiaigbé (Aug.) Chillou 610! Manéa (June) Chillou 2631! foot of Nimba Mts. Schnell 3428! Nzérékoré Adam 6265! **S. L.:** Freetown (Sept.) Hepper 923! Martin (Jan.) Deighton 3545! Konta (Sept.) Jordan 108! Port Loko to Mange (May) Jordan 871! Kambia (July) Jordan 469! **Ghana:** Burufo, nr. Lawra (July) Adams 928! Hall CC 761! Pepease to Kwahu (May) Hall 3660! Kwahu Tafo (Apr.) Hall 3017! 3018! **N. Nig.:** Kan Gimi, Anara F.R. (May) Keay FHI 22947! **S. Nig.:** Idanre, Ondo Prov. (Aug.) Jones FHI 20723! Mt. Orosun, Idanre Hills (Oct.) Keay FHI 22594!

Occurs widely to India and Java though rarely recorded in central and north-eastern Africa.

6. *Fimbristylis striolata* Napper in Kew Bull. 25: 438 (1971). *APD acc*

Scarcely differing from *F. albiviridis* except by the achene, though the habit is usually rather stouter than commonly recorded for the other; an extreme, very slender form with solitary spikelets is common in some areas; **seasonally swampy places, rice fields and grassland.**

Sen.: Fatick (Dec.) J. & A. Raynal 6713! Diohine (Oct.) Berhaut 3941! Kaolack (Oct.) Berhaut 3802! Tambacounda (Sept.) Berhaut 3308! Casamance (Sept.) Adam 18121! **Guin.:** La Kolenté, Botocoli Rd. (Nov.) Chillou 1017! **S. L.:** Mateboi (Nov.) Jordan 830! Kabala (Dec.) Deighton 4409!

7. *Fimbristylis pilosa* Vahl Enum. 2: 290 (1805); F.T.A. 8: 416. *APD acc*

APD: *Synonym of Bulbostylis pilosa* (Willd.) Cherm.

Perennial, rarely annual, with narrow leaves 0.5–1.7 mm. wide; inflorescence with few, 3–9 spikelets, glumes with dark chestnut to black patches and green keel; spikelets larger than *F. dichotoma* and the rhachilla broader; **damp or swampy places in grassland and savanna.**

Sen.: (Sept.) Fotius K394! Ziguinchor (Sept., Oct.) Adam 18225! Broadbent 82! **Guin.:** Bandakure, S.W. of Pita (Mar.) Adames 287! Kouroussa (July) Pobéguin 419! **S. L.:** Mayumbo (Aug.) Also in the **Congo Republic** and **Uganda**.

8. *Fimbristylis schoenoides* (Retz.) Vahl Enum. 2: 286 (1805); Berhaut, Fl. Sén. ed 2, 373. *APD acc*

APD: *Synonym of Bulbostylis atrosanguinea* (Boeckeler) C.B. Clarke

Scirpus schoenoides Retz., Obs. 5: 14 (1788).

Narrow-leaved annual or perennial with solitary, or rarely paired, spikelets; **swampy places in grassland.**

Sen.: Diohine (Oct.) Berhaut 1711! Oussouyé (Oct.) Adam 18297! Kerharo & Adam 1563! Casamance (Oct.) Adam 18151! 18373! Niassia (Nov.) Berhaut 6655! **S. L.:** Martin (Jan.) Deighton 3544! Bakepet, Mambolo (Dec.) Jordan 735! **Ghana:** Burufo, nr. Lawra (Sept.) Hall CC 746!

Widespread in India.

9. *Fimbristylis ferruginea* (Linn.) Vahl Enum. 2: 291 (1805); F.T.A. 8: 417; Berhaut, Fl. Sén. ed. 2, 361, 370, 371, 373. *APD acc*

Scirpus ferrugineus Linn., Sp. Pl. ed. 2, 74 (1762).

Stout tufted erect perennial 45–75 cm. high with narrow leaves and small dense panicles of few to many spikelets and bracts of very variable length; spikelets lanceolate, grey and rust coloured; **brackish swamps and damp grassland.**

Sen.: Hann (Mar.) Berhaut 7022! Thiès (June) Berhaut 2612! Bamboulan, nr. Toubacouta (Oct.) Monod 8589! M'boro to Fatick (July) Trochain 247! Oussouyé (Sept.) Widespread in all parts of the tropics.

10. **Fimbristylis nigritana** *C.B. Cl.* in F.T.A. 8: 418 (1902). *APD acc*

Stout perennial with leaves 3–4 mm. wide and dark spikelets up to 12 mm. long with finely punctate black achenes and acute glumes similar to those of *F. scabrida*.

N. Nig.: Nupe Barter 623!

11. **Fimbristylis barteri** *Boeck.* in Linnaea 37: 33 (1871). *APD acc*

Differs from *F. scabrida* in the much coarser habit, the widely spreading Inflorescence with ovate-elliptic spikelets on long lax pedicels and the biconvex, smoother larger achene usually with a 2-fid style, though the lowest fertile florets of the spikelet may have 3-fid styles despite a biconvex achene; **grassland and close to dams.**

Ghana: Tumu (May) Morton GC 7541! **N. Nig.:** Nupe Barter 1578! Maska, Katsina Dist. (June) Keay FHI 25899!

12. **Fimbristylis scabrida** *Schumacher. Beskr. Guin.* Pl. 32 (1827); F.T.A. 8: 422; Aké Assi, Contrib. 263 (1964). *APD acc*

Fimbristylis muriculata *Benth.* in Fl. Nigrit. 554 (1849) (*F. muricata* Walp., Ann. 3: 688 (1854), and *F. muriculata* Steud., Syn. Pl. Glum. 2: 113 (1855)—both orthographic errors for *muriculata*.)

Fimbristylis mucronata *Boeck.* in Linnaea 37: 41 (1871).

Fimbristylis pachystachys *Cherm.* in Bull. Soc. Bot. Fr. 68: 418 (1921).

Fimbristylis tenera of *C.B. Cl.* in F.T.A. 8: 420, partly, and of Hutch. in F.W.T.A., ed. 1, 2: 476; not of Schult.

Plant very variable in size with stem-bases forming coarse matted fibrous tufts and panicles of lanceolate-cylindric spikelets with acute glumes; **damp grassland, savanna and rocky outcrops.**

Also eastwards to the Congo.

13. **Fimbristylis chevalieri** *Kük.* in Bull. Mus. Hist. Nat. Paris sér. 2, 3: 547 (1931). *APD acc*

Tufted perennial similar in habit to *F. scabrida* but with much paler ovate-elliptic larger spikelets; **in savanna.**

Sen.: Geneto to Kourientun (May) Naegelé! Kanouméri, Kédougou (June) Fotius K123! **Guin.:** Bioumahame to Siguin (May) Chev. 25897! Mamou (May) Pitot!

14. **Fimbristylis schweinfurthiana** *Boeck.* in Flora 37: 565 (1879); F.T.A. 8: 420. *APD acc*

Small slender-stemmed plant with narrow leaves and thick perennial tufts of old culm- and leaf-bases, spikelets only 2–6, brown; rocky outcrops, shallow soils on seasonally swampy ground, seepage areas.

Mali: Kita (July) Jaeger 34! 39! **Guin.:** Kindia (May) Jac.-Fél. 1635! **S. L.:** Waterloo (May) Deighton 2649! Kukuna (Apr.) Hepper 2645! Loma Mts. (June) Morton SL 3565!

Also across to the **Sudan.**

15 **Fimbristylis debilis** *Steud.* Syn. Pl. Glum. 2: 109 (1855); Napper in Kew Bull. 25: 438 (1971). *APD acc*

Fimbristylis tenera of F.T.A. 8: 420, partly; Berhaut, Fl. Sén. ed. 2, 372; not of Schult.

Slender annual up to 30 cm. high or perennial with a creeping rhizome, rarely the culm-bases surrounded with fibrous sheath-remnants; *savanna and scrub but especially in and near pools on laterite outcrops.*

Sen.: Heudelot 324! Ross-Bétio (Aug.) Audru 2159! Berhaut 372! Rufisque Leprieur. Kaolak to Fatick Trochain 4052. **Gam.:** (Aug.) Ruxton 148! **Mali:** Diondiou (June) Chev. 1010. 17. *Fimbristylis complanata* (Retz.) Link Hort. Berol. 1: 292 (1833); F.T.A. 8: 422. *APD acc*

Scirpus complanatus Retz., Obs. 5: 14 (1789).

Tufted leafy perennial with broadly linear leaf-blades rounded at the tip and compressed linear stems bearing contracted panicles with elongated golden brown spikelets; *in rocky places, rare.*

Lib.: Monrovia (Nov.) Barker 1466! Gbau, Sanokwele Dist. (Sept.) Baldwin 9437! **N. Nig.:** Vom (Dec.) Haines 82!

Occurring in most tropical regions.

18. *Fimbristylis littoralis* Gaud. in Freyc. Voy. Bot.: 413 (1826); Napper in Kew Bull, 25: 439 (1971). *APD acc*

Fimbristylis miliacea Vahl, Enum. 2: 287 (1805); F.T.A. 8: 421; Aké Assi, Contrib. 262 (1964); Berhaut, Fl. Sén. ed. 2, 373 (1967); not *Scirpus miliaceus* Linn.

Tufted leafy annual with numerous panicles of very small globose spikelets; *in marshy grassland, rice-fields, edge of dams, etc.*

Sen.: Heudelot 212! Casamance (Oct.) Adam 18482! **Iv. C.:** Ayamé (May) Aké Assi 4747! **Ghana:** Takoradi (Mar.) Hall 2571! Cape Coast (Mar.) Hall 1060! Kade (June) Irvine 4845! Kusu lagoon, nr. Akuse (Feb.) Hall CC 1213! Kete Krachi (Dec.) Adams 4561! **N. Nig.:** Jebba (Dec.) Hagerup 741! Edozhigi, nr. Bida (June) Vaillant 2659! Bida to Badeggi (Aug.) Onochie FHI 35420! **S. Nig.:** Adani (Nov.) Tuley 17!

Widespread in eastern tropical regions, rare in Africa and possibly introduced with cultivated rice.

[Blake and Kern in their studies of *F. miliacea* (Linn.) Vahl have shown that this name belongs to a taxon other than the one usually recognised as such. *F. littoralis* is the correct name for the plant previously known as *F. miliacea* (Linn.) Vahl.]

19. *Fimbristylis quinquangularis* (Vahl) Kunth Enum. 2: 229 (1837); Aké Assi, Contrib. 262 (1964), partly; Berhaut, Fl. Sén. ed. 2, 373. *APD acc*

Scirpus quinquangularis Vahl, Enum. 2: 279 (1805).

Tufted annual similar to *F. littoralis* but with lanceolate elliptic small spikelets; *in rice-fields, marshy grassland, etc.*

Sen.: Niokolo-Koba (Nov.) Adam 19926! Moulessi, Tambacounda to Kedougou (Dec.) J. & A. Raynal 6745! **N. Nig.:** Edozhigi, Bida (Apr.–Oct.) Vaillant 2740! 2741! 2792! Biliri, S. of Gombe (Nov.) J. Lowe 1516! **S. Nig.:** Adani (Nov.) Tuley 19!

Widespread in all tropical regions.

20. **Fimbristylis aphylla** Steud. Syn. Pl. Glum. 2: 114 (1855); Napper in Kew Bull. 25: 440 (1971). *APD acc*

Fimbristylis quinquangularis of F.T.A. 8: 421; F.W.T.A., ed. 1, 2: 476; Aké Assi, Contrib. 262 (1964), partly.

Fimbristylis testui Cherm. in Arch. Bot. Caen 4, Mém. 7: 33 (1931)

Stout tufted perennial with the leaf-blades much reduced, scarcely reaching 1 cm. long, and acutely quadrangular almost winged stems up to 75 cm. high, widely spreading panicles often broader than long with light chestnut elliptic-lanceolate spikelets and short bracts; **swamps and very damp ground in savanna and near rivers, etc.**

S. L.: Waterloo (Aug.) Melville & Hooker 274! Mahera (Oct.) Glanville 415! Rokon (July) Jordan 483! Boajibu (Mar.) Deighton 4091! Koinadugu (Aug.) Haswell 260! Sahn (Apr.) Deighton 1686! **Ghana:** Sampa, NW. Ashanti (Apr.) Morton A3264! **S. Nig.:** Ikorodu (Mar.) Gledhill 629!

Eastwards to the Congo.

21. **Fimbristylis obtusifolia** Kunth Enum. 2: 240 (1837); F.T.A. 8: 423; Berhaut, Fl. Sén. ed. 2, 373.

APD: Synonym of Fimbristylis cymosa R. Br.

Tufted rhizomatous perennial with rather rigid leaves and with crowded clusters of dark beige spikelets with very small glumes; **sea-shore, on sand, mud or among rocks.**

Sen.: Roger! Mboro (Apr.) Pitot! Niaga, L. Retba (July) J. & A. Raynal 6079! Hann (July) Naegelé! Diouloulou, Casamance (Sept.) Adam 18149! **S. L.:** Toke, Peninsular (Jan.) Morton SL 610! Freetown (Sept.) Milne-Redhead! Harvey 144! Yele, Turtle Is. (Nov.) Deighton 2307! King Tom (Oct.) Deighton 2157! **Lib.:** Monrovia (June, July) Adam 16571! Dinklage 2824! Grand Bassa (Apr.) T. 26. *Fimbristylis tisserantii* Cherm. in Arch. Bot. Caen 4, Mém. 7: 32 (1931); Napper in Kew Bull. 25: 440 (1971).

*APD: Synonym of *Bulbostylis lyei* Verdc.*

***P. exilis* var. *rufescens* Cherm.** in Bull. Soc. Bot. Fr. 81: 266 (1934).

Tufted glabrous annual with large spikelets similar to those of *F. hispidula* subsp. *brachyphylla* having glabrous or puberulous glumes without a mucro; an ellipsoid not oblanceolate achene white before maturity and sharply ridged; **swampy grassland and savanna.**

Guin.: Friguiagbé (Aug.) Chillou 2112! **Iv. C.:** Foro-foro Forest, 25 km. N. of Bouaké (Sept.) Oldeman 407! **Ghana:** Ejura (Aug.) Halt CC 327! Yeji (Aug.) Hall CC 383! Oti River, nr. Kpandai (Aug.) Hall GC 38768! Tamale to Bolgatanga (Aug.) Hall CC 435! **Togo Rep.:** Sokodé (Aug.) Mahoux 2169!

[West African plants of this species have rather smaller spikelets than those from the Central African and Congo Republics, but it is impossible to decide until further material becomes available and the range of variation can be more accurately assessed whether one or two subspecies are involved.]

12. FUIRENA

***Rottb.*, Descr. et Ic. Pl. 70 (1773); F.T.A. 8: 461 (1902).**

- 1 Rhizomatous perennial; stems and sheaths conspicuously 5-angled; leaves with 5 main nerves, upper exceeding the internodes in length; three of the hypogynous bristles with an obovate, apiculate lamina as long as the achene [1. *umbellata*](#)
- Annual or caespitose perennial; stems and sheaths triangular, terete or inconspicuously 5-angled; leaves with one or several main nerves: [2](#)
- 2 Stems and sheaths triangular; leaves stiff, keeled, one-nerved; tips of the glumes erect: [3](#)

- Stems and sheaths terete or obscurely 5-angled; leaves soft, many-nerved, hairy; tips of the glumes conspicuous, spreading; hypogynous bristles laminate or absent:5
- 3 Spikelets ovoid, 4–5 mm. wide [5. sp. aff. pubescens](#)
- Spikelets narrowly ellipsoid, 2–3 mm. wide 2. stricta4
-@
- 4 Spikelets angular, glumes more or less obviously 5 ranked [2a. stricta var. stricta](#)
- Spikelets terete, generally greenish [2b. stricta var. chlorocarpa](#)
- 5 Ligule brown, smooth or shortly hairy; spikelets about 3 mm. wide; tips of the glumes about 1.5 mm. long; three hypogynous bristles with a quadrate 3-nerved lamina; achene 0.8–1.25 mm. long [3. ciliaris](#)
- Ligule transparent, ciliate; spikelets about 2 mm. wide; cilia of the glume about 1.0 mm. long; 0–3 hypogynous bristles with a small rectangular lamina less than half as long as broad; achene 0.4–0.65 mm. long [4. leptostachya](#)

1. **Fuirena umbellata** *Rottb.* Descr. et Ic. Pl. 70, t. 19, f. 3 (1773); F.T.A. 8: 466; Berhaut, Fl. Sén. ed. 2, 359 (1967). *APD acc*

Fuirena glomerata *Lam.*, Ill. 1: 150, t. 39 (1791).

Fuirena seriata *C.B. Cl.* in Mém. Soc. Bot. Fr. 2, 8: 28 (1907).

Fuirena mahouxii *Cherm.* in Bull. Soc. Bot. Fr. 81: 264 (1934).

Generally robust, often with the lowermost internode of the flowering stems becoming swollen; common on river banks and other moist places.

Scattered throughout tropical Africa.

[Differs from the Indian *F. trilobites* C.B. Cl. only in the smaller achene.]

5. *Fuirena* sp. aff. *pubescens* (Poir.) Kunth Enum. Pl. 2: 182 (1837); F.T.A. 8: 463. *APD acc*

***Carex pubescens* Poir.**, Voy. Barb. 2: 254 (1789).

Plants grey-green with grey hairy glumes in few ovoid spikelets; **moist ground**.

N. Nig.: Kano, Korel (Apr.) Onwudinjoh FHI 22362!

[Very similar in habit and spikelet to *F. pubescens* which occurs in the Mediterranean region, throughout Africa and in India, but distinguished by the presence of hypogynous bristles, which are sometimes narrowly laminate.]

13. ASCOLEPIS

Nees ex Steud., Syn. Pl. Cyp. 105 (1855), nom. cons.; F.T.A. 8: 473 (1902). *APD acc*

- 1 Annual with an inflorescence of several spikelets forming a lobed Kyllinga-like head; stems slender, up to 25 cm. high: **2**
Annual with a globular, hemispherical or discoid inflorescence of a single spikelet, or perennial: **3**
- 2 Hypogynous scale enclosing the achene, with its upper margin inflated, white or red, and with a short postical tip [1. pusilla](#)
Hypogynous scale flat, not enclosing the achene, with an acumen as long as the rest of the scale; an antical seta is persistent on the rhachilla after glume fall [2. dipsacoides](#)
- 3 Inflorescence of about 4 spikelets in a pyramidal head; plant shortly rhizomatous; sheaths reddish, not fibrous [5. brasiliensis](#)
Inflorescence of a single spikelet: **4**
- 4 Inflorescence 25–40 mm. diam.; hypogynous scale about 15 mm. long [6. elata](#)
Inflorescence not exceeding 12 mm. diam.: **5**
- 5 Hypogynous scale with a subcylindric tip and narrow base; stems slender, about 0.5 mm. diam., often thickened at the base with pale fibrous sheaths [3. protea](#)
Hypogynous scale with a flattened tip and winged base; stems about 1 mm. diam., clustered; sheaths becoming black and fibrous [4. capensis](#)

1. **Ascolepis pusilla** *Ridley* in Trans. Linn. Soc., ser. 2, 2: 164 (1884); F.T.A. 8: 476; Berhaut, Fl. Sén. ed. 2, 369 (1967); J. Raynal in Adansonia sér. 2, 8: 98 (1968). *APD acc*

Slender plant with a greenish inflorescence and smooth outline to the spikelets; [rice fields and other marshy ground](#).

Sen.: Kanéméré: (Nov.) Fotius K688! Niokolo-Koba (Nov.) Adam 16970! 17079–20! **Mali:** Sotuba (Dec.) J. & A. Raynal 5236. Farako (Nov.) Demange 3276! **Guin.:** Kandiara R. (Oct.) Pitot! In Madagascar and S. America.

6. *Ascolepis elata* Welw. in Trans. Linn. Soc. 27: 79 (1869); F.T.A. 8: 476.

APD: *Synonym of Ascolepis speciosa Welw.*

Plant with white radiate heads about 35 mm. across; in swampy grassland.

N. Nig.: Abinsi Dalz. 813! Naraguta F.R., Jos Plateau (Aug.) Keay FHI 20064! Panyam, 4,500 ft. (July) Lely 411! Ibi, Muri Prov. (July) Hepburn 30! Kilba country, Yola Prov. (Aug.) Dalz. 238!

Extending over much of tropical Africa from Sudan to Rhodesia.

14. LIPOCARPHA

R. Br. in Tuckey, Narr. Exp. Congo 459 (1819), nom. cons.; F.T.A. 8: 468 (1902).

- 1 Spikelets pale even when mature; glumes whitish, sometimes dark towards the base:2
- Spikelets dark or becoming so at maturity; glumes red, brown or black, sometimes with pale tips:3
- 2 Spikelets confluent, 3–6 in the echinate head; glume gradually narrowed into a long blunt-tipped, spreading

- arista; plant with creeping rhizome [1. albiceps](#)
- Spikelets discrete, 5–16 in the head; glume with a short blunt, triangular tip; plant densely caespitose [2. chinensis](#)
- 3 Perennial, shortly rhizomatous: 4
- Annual, sometimes robust; spikelets less than 4 mm. broad: 5
- 4 Spikelets 2.5–3.0 mm. broad, black; glume with a short straight arista [3a. atra var. atra](#)
- Spikelets 3.5–5 mm. broad, brown; glume with a pale spreading or recurved arista [3b. atra var. barteri](#)
- 5 Glumes clearly aristate, with a pale arista 1/2–1 times as long as the uniformly dark body of the glume; rhachilla of the spikelet 0.5–0.75 mm. broad; achene elliptical somewhat compressed [5. nana](#)
- Glumes with a pale apiculus or short acumen not more than 1/3 as long as the generally bicolored glume; spikelets terete: 6
- 6 Achene broadly obovate, trigonous; spikelets obtuse with a tendency to become cylindrical; glumes very concave; rhachilla 0.75–1 mm. broad with the persistent glume bases surrounding the scars conspicuous 4. priuriana 7
- @
- Achene elliptical, somewhat flattened; spikelets ovoid; rhachilla 0.5–0.75 mm. wide with the persistent glume bases small so that the scars form a regular spiral pattern [6. sphacelata](#)
- 7 Glume truncate, with a small triangular mucro [4a. priuriana var. priuriana](#)
- Glume with a broad pale arista [4b. priuriana var. crassispis](#)

1. **Lipocarpa albiceps** *Ridl.* in Trans. Linn. Soc. ser. 2, 2: 163 (1884); F.T.A. 8: 471. *APD acc*

Sometimes, at least, having a distinct storage rhizome; [damp places in grassland or open woodland](#).

Throughout tropical and S. Africa and from India to China and Australia.

3. **Lipocarpus atra** *Ridl.* in Trans. Linn. Soc. ser. 2, 2: 162 (1884). *APD acc*

APD: Synonym of Lipocarpus abietina Goetgh.

3a. **Lipocarpus atra** var. **atra** *APD acc*

Characterized by the rhizome, the yellowish stems much exceeding the leaves, and the dark, echinate spikelets which are smaller than those in the variety following.

Sen.: Badi (Sept.) Berhaut 3066! **U. Volta:** Lac de Tengréla (July) Aké Assi 10751!

Also in **E. Cameroun**, **Central African Rep.**, the **Congo** and **SE. tropical Africa**.

3b. **Lipocarpus atra** var. **barteri** (*C.B. Cl.*) *J. Raynal* in Adansonia sér. 2, 7: 85 (1967).

APD: Synonym of Lipocarpus barteri *C.B. Clarke*

Lipocarpus barteri *C.B. Cl.* in F.T.A. 8: 472 (1902).

Kyllinga baoulensis *A. Chev.*, Bot. 698 (1920), name only.

Spikelets larger than those of other W. African species with conspicuous pale glume tips; **wet patches in savanna**.

Iv. C.: Sémien to Kanébly (June) Aké Assi 9077! Bouaké (Jan.) de Wit 7372/549! Dimbokro Scaëtta 3078 (89)! **Ghana:** Burufo, nr. Lawra (May) Morton GC 7641! Sampa, N. W. Ashanti (Apr.) Morton A3267! Also in **Ethiopia** and **SE. tropical Africa**.

4b. **Lipocarpus prieuriana** var. **crassispis** *J. Raynal* in Adansonia sér. 2, 7: 86, fig. 2 (1967).

Differing from the typical and commoner variety only in the development of the glume tip into a broad green arista; brackish areas.

APD: Synonym of Lipocarpus crassispis (*J. Raynal*) Goetgh.

Sen.: Fatick (Dec.) J. & A. Raynal 6711! Kaolack Adam 8241!

5. **Lipocarpus nana** (*A. Rich.*) *Cherm.* in Bull. Soc. Bot. Fr. 71: 142 (1924). *APD acc*

APD: Synonym of Lipocarpus nana (*A. Rich.*) *Cherm.*

Fuirena nana *A. Rich.*, Tent. Fl. Abyss. 2: 497 (1851).

Lipocarpus pulcherrima *Ridl.* in Trans. Linn. Soc. ser. 2, 2: 162 (1884); F.T.A. 8: 473.

Spikelets dark with green aristate tips; **rare or perhaps overlooked amongst other ephemeral species in damp situations**.

Guin.: Sébéri, nr. Kanéa (Oct.) Adam 12676! Ditinn (Oct.) Pitot! **N. Nig.:** Jos Plateau (Aug.) Lely P471! **W. Cam.:** Nkambe, Bamenda (Sept.) Ujor FHI 30229!

Also in the **Congo** and from **Ethiopia** to the Transvaal.

6. *Lipocarpus sphacelata* (Vahl) Kunth Enum. Pl. 2: 267 (1837).

*APD: Synonym of *Lipocarpus filiformis* (Vahl) Kunth*

Hypaelyptum sphacelatum Vahl, Enum. 2: 283 (1806).

Lipocarpus triceps (Lam.) Nees (1834)—F.T.A. 8: 470; F.W.T.A., ed. 1, 2: 471; Berhaut, Fl. Sén. ed. 2' 369 (1967).

Kyllinga triceps Lam. (1791), not of Rottb. (1773).

Distinguished from *L. prieuriana* by the smaller, less obtuse spikelets and conspicuous, if short, glume tips; roadsides and other sandy brackish places.

Sen.: Niokolo-Koba (Oct.) Adam 15840! Oussouye (Nov.) Berhaut 6516! Kabrousse (Oct.) Adam 18308! Kolda (Oct.) Adam 18551! Velingara (Oct.) Adam 18567! **Mali:** Kita (Aug.) Jaeger 16! Also in the **Congo**, **Madagascar**, **India** and **Thailand**.

15. RHYNCHOSPORA

Vahl, Enum. 2: 229 (1806) nom. et orth. cons.; F.T.A. 8: 478 (1902); Kükenthal in Engl., Bot. Jahrb. 74: 375 (1949), 75: 90 (1950), 75: 273 (1951).

- 1 Spikelets sessile and crowded together into one or more hemispherical or spherical heads:2
Spikelets distinct and more or less clearly pedicellate:4
- 2 Inflorescence a single, terminal, hemispherical head, surrounded by stiff, erect or spreading bracts; caespitose annual or perennial 1. rubra.....3
.....@
Inflorescence of one to a dozen (generally 3–4) spherical or subspherical greenish-brown heads; rhizomatous perennial 2. *holoschoenoides*
- 3 Bristles shorter than, or equal to, the achene; beak short 1a. *rubra* subsp. *africana*
Bristles longer than the very hispidulous achene; beak long 1b. *rubra* subsp. *senegalensis*
- 4 Inflorescence a single, simple, terminal corymb of 3–10 large white or whitish spikelets; perennial with a narrow, creeping, scaly rhizome; stigmas 2 5. *candida*
Inflorescence not as above :5
- 5 Robust, leafy perennial with a branched inflorescence and leafy bracts; spikelets 8–10 mm. long; style undivided:6
Annual or slender perennial; spikelets up to 8 mm. long:7
- 6 Spikelets in large clusters on stout, spreading pedicels; sheaths tough, leaves distinctly keeled, often more than 1 cm. wide 3. *corymbosa*
Spikelets 1 to a few together in small clusters on long, slender, erect pedicels; sheaths soft, rounded on the back; leaves less than 1 cm. wide 4. *triflora*
- 7 Spikelets solitary, pedicellate, 5–8 mm. long; inflorescence confined to upper part of stem; achene about as long as broad, rugulose, style-base tissue extending down the sides of the achene:8
Spikelets 2–5 mm. long, in small clusters:9

- 8 Pedicels stout, erect or spreading; spikelets ovate, acuminate; rhachilla straight; leaves up to 4 mm. wide, flat [6. *eximia*](#)
Pedicels slender, capillary; spikelets elliptical; rhachilla strongly flexuose; leaves up to 1.5 mm. wide, canaliculate [7a. *gracillima* subsp. *subquadrata*](#)
- 9 Spikelets dark brown; partial inflorescence rather narrow; style-base triangular, not decurrent on the achene ... [8. *rugosa*](#)
Spikelets pale straw-coloured or yellow-brown; inflorescence generally occupying more than half of stem: .. **10**
- 10 Spikelets straw-coloured, very small, 2–2.5 mm. long with only one achene; style-base lunate, upper edge of achene with two distinct humps [11a. *tenerrima* subsp. *microcarpa*](#)
Spikelets 2.5–5 mm. long; style-base not lunate: **11**
- 11 Style-base small, inconspicuous; achene surface not rugulose, generally with two lateral basal brown patches and a central dark stripe; spikelets 2.5–3.5 mm. long [9. *brevirostris*](#)
Style-base apiculate, decurrent on the rugulose achene, without basal patches; spikelets 4–5 mm. long [10. *perrieri*](#)

1. **Rhynchospora rubra** (Lour.) Makino in Bot. Mag. Tokyo 17: 180 (1903). *APD acc*

R. rubra subsp. rubra does not occur in West Africa.

1a. **Rhynchospora rubra subsp. africana** J. Raynal in J. & A. Raynal in Adansonia, sér. 2, 7: 323 (1967). *APD acc*

Rhynchospora wallichiana of F.T.A. 8: 478, and of F.W.T.A., ed. 1, 2: 470.

Rhynchospora minor of Nelmes in Kew Bull. 11: 533 (1957); Berhaut, Fl. Sén. ed. 2, 368 (1967); not of (Nees) Schnee (1944).

Rhynchospora parva of Aké Assi, Contrib. 258 (1963).

Tufted plant about 15–50 cm. high, with linear grassy leaves and a small yellowish inflorescence; moist savanna or grassland, often on sand.

Sen.: Lyndiane (Sept.) Adam 12487. Toubakouta, Casamance (Jan.) J. Raynal 7933. **S. L.:** Waterloo (Aug.) Melville & Hooker 296! Manoh (Apr.) Dinklage 2516! Mano Salija (Nov.) Excluded and doubtful species

- Rhynchospora senegalensis** Steud.—F.W.T.A., ed. 1, 2: 470

Fuirena stricta Steud.

Rhynchospora micrantha Vahl Enum. 2: 231 (1806); F.T.A. 8: 481; F.W.T.A., ed. 1, 2: 470. "In montosis Guineae 1786 Isert".

This Central American species has not otherwise been recorded from West Africa.

16. CLADIUM

P. Br., Hist. Jam. 114 (1756); F.T.A. 8: 484 (1902).

- 1 Erect robust sedge to 1·60 m. high with creeping rhizomes, rounded leafy stems and saw-edged leaves and bracts; inflorescence an interrupted compressed panicle with numerous slender rays bearing clusters of small red-brown ovoid spikelets; achene broadly ovate, 2·5 mm. long, rugulose above ..[mariscus subsp. jamaicense](#)

Cladium mariscus subsp. jamaicense (Crantz) Kük. in Peter in Fedde, Rep. Beih. 40, 1: 523 (1938), and in Fedde, Rep. 51: 189 (1942).

APD: Synonym of Cladium jamaicense Crantz

Cladium jamaicense Crantz, Instit. 1: 362 (1766); A. Raynal in Ann. Fac. Sci. Univ. Dakar 9: 167 (1963).

Cladium mariscus of Adam in Not. Syst. 16: 317 (1960); Berhaut, Fl. Sén. ed. 2, 360 (1967).

Characterized by the very sharp serrated edges of the tough leaves and bracts; [marshy woodland and dune slacks of the Cape Verde Peninsula](#).

Sen.: Dakar Adam 17635! 17679! 17699! M'bidjem (June) J. & A. Raynal 5982! Mbeubeussé (May) Naegelé!

Also in [Cape Verde Islands](#), [Congo](#), [Socotra](#), [Kenya](#), [Uganda](#) and to S. Africa, and the Old and New World tropics; subsp. mariscus occurs in temperate regions.

17. MAPANIA

Aubl., Pl. Guin. Franc. 1: 47 t. 17 (1775); F.T.A. 8: 489 (1902).

- 1 Inflorescence on an axillary peduncle which bears reduced leaves only, and subtended by short scarious bracts: **2**
 Inflorescence on a terminal peduncle bearing normal leaves below, and subtended by leafy bracts:**4**
- 2 Leaf-blade oblong, 40–85 mm. broad, suddenly narrowed into a pseudopetiole below, obtuse and cuspidate above; sheath inflated, red-purple within[1. baldwinii](#)
 Leaf-blade linear, 10–45 mm. broad, gradually narrowed below, acute to acuminate; sheath not inflated:**3**
- 3 Stigmas 2; leaf-tip asymmetrical, acute; inflorescence straw-coloured, spikes more or less confluent ... [2. linderi](#)
 Stigmas 3; leaf-tip symmetrical, acuminate; inflorescence brown, spikes discrete, acute, in heads up to 2 cm. across[3. mangelotiana](#)
- 4 Triangular pseudopetiole present above sheath[4. amplivaginata](#)
 Leaf-blade narrowed above sheath but not forming a triangular pseudopetiole:**5**
- 5 Achene with a surface reticulum of raised lines:**6**
 Achene with a tuberculate surface:**7**
- 6 Spikes more or less confluent into a hemispherical inflorescence; peduncles enlarged beneath head; leaves tinged red beneath; glumes 7–10 mm. long; achene with simple longitudinal ribs[5. coriandrum](#)
 Spikes discrete in a spherical inflorescence; peduncle not enlarged; glumes 4–5 mm. long; achene with branched longitudinal ribs[6. minor](#)
- 7 Leaves and bracts suddenly narrowed into a triangular tip[7. ivorensis](#)
 Leaves and bracts gradually acuminate:**8**
- 8 Glumes brown; style-base not persistent[8. macrantha](#)
 Glumes white; style-base yellowish, conical and persistent[9. rhynchocarpa](#)

1. Mapania baldwinii Nelm. in Kew Bull. 6: 420 (1951); Nelm. & Baldwin in Amer. J. Bot. 39: 369 (1952). *APD acc*

Mapania comoensis of F.W.T.A., ed. 1, 2: 471 (1936), English descr. only.

Readily distinguished from other species by a combination of pale axillary inflorescences, oblong leaves and inflated sheaths; **in forest**.

9. *Mapania rhynchocarpa* *Lourougnon & J. Raynal* in *Adansonia*, sér. 2, 8: 419 (1988). *APD acc*

Similar in habit to *M. ivorensis* but with a larger inflorescence; [in forest](#).

S. L.: Mt. Loma (Sept.) Jaeger 7461. **iv. C.:** Soubré (Apr.) Lorougnon 1108 & 1112.

18. HYPOLYTRUM

L. C. Rich. in *Pers. Syn.* 1: 70 (1805); *F.T.A.* 8: 486 (1902); *Nelmes* in *Kew Bull.* 10: 63–82 (1955).

- 1 Flowering stems axillary, bearing scales or reduced leaves at the base and bracts which scarcely exceed the inflorescence at the top; achene topped by a distinct inflated style-base:2
Flowering stems terminal with well-developed cauline leaves; bracts leaf-like, often exceeding the inflorescence; achene with the style-base either small or hardly distinguishable from the rest of the achene:5
- 2 Spikelets narrowly elliptic or cylindric (7-)10–15(-20) mm. long; glume uniformly brown; achene elliptic, narrowed above and below, with an enlarged style-base somewhat smaller than the longitudinally wrinkled base of the achene; leaves 8–15(-20) mm. broad1. [heteromorphum](#)
Spikelets elliptic to ovate or obovate, 4–9 mm. long:3
- 3 Glume pale and red-dotted in the upper half, darker below; achene oblong or obovate style-base pale, enlarged, conical, decurrent on the angles of the deep green irregularly reticulate-costate base of the achene; leaves (13.5-)18–25(-28) mm. broad; flowering stem often dull purple2. [poecilolepis](#)
Glume rufous except for a pale margin or tip; achene obtuse with the pale enlarged style-base exceeding the dark wrinkled basal part of the achene and exerted beyond the glume at maturity:4
- 4 Inflorescence contracted, not exceeding 3 cm. across; spikelets about 3 mm. wide, pale with the broad white margins of the glumes3. [senegalense](#)
Inflorescence corymbose, exceeding 5 cm. across; glumes without a wide white margin4. [africanum](#)
- 5 Achene pale, purple-spotted, smooth or slightly ridged; style-base large but at maturity not differentiated from the rest of the elliptical achene; plant rhizomatous, large, common5. [purpurascens](#)
Achene brown at maturity, deeply longitudinally costate, stylo-base small not inflated;6
- 6 Basal leaves reduced to brown-edged sheaths, cauline leaves borne towards the top of the slender stems, elliptical, somewhat glaucous; bracts leaf-like, exceeding the slender, few-spikeletted paniculate inflorescence; achene nearly spherical, dark reddish-brown, deeply longitudinally ridged and slenderly transversely lineolate with the simple style-base as a terminal apiculus6. [costatum](#)
Basal and cauline leaves similar, linear-lanceolate; inflorescence corymbose with many dark spikelets; stamens 3; achene deeply longitudinally costate7. [cacuminum](#)

1. *Hypolytrum heteromorphum* *Nelmes* in Kew Bull. 9: 522 (1955).

APD: Synonym of Mapania heteromorpha (Nelmes) Lye

Hypolytrum africanum of F.T.A. 8: 488; F.W.T.A., ed. 1, 2: 472; Nelmes & Baldwin in Amer. J. Bot. 39: 371 (1952), partly.

Differs from all the following species in the flowering spikes being several times longer than broad; **on wet rocks and other damp places in forest.**

19. SCLERIA

Berg., Vet. Acad. Handl. Stockh. 24: 142, t.4 & 5 (1765); F.T.A. 8: 493 (1902); *Nelmes* in Kew Bull. 10: 415 (1955), and 11: 73 (1956); E. A. Robinson in Kew Bull. 18: 487 (1966).

Hypoporum *Nees* in Linnaea 9: 303 (1834).

- 1 Hypogynium enlarging at maturity into a ciliate-margined corky cupule wider than the achene; stout broad-leaved perennials with a terminal panicle:2
Hypogynium small to very small, lobed or reduced to an undifferentiated stipe-like base to the achene, margin entire:4
- 2 Achene smooth:3
Achene verrucose except for the smooth, shining apex, subglobose to globose, about 3 mm. diam., cream3.
[verrucosa](#)
- 3 Achene compressed, with a circular groove round the top close to the style-base, 4.5–6 mm. diam., bluish grey at maturity, shining1. [depressa](#)
Achene globose to subovoid, slightly compressed, 2.5–3.25 mm. diam., ivory to honey-grey at maturity, shining2. [vogelii](#)
- 4 Fertile spikelets unisexual; hypogynium usually well developed; inflorescence of terminal and axillary panicles with leafy bracts, not composed of a series of interrupted spikes (see also Nos. 20–22):5
Fertile spikelets bisexual; hypogynium little developed, usually represented by a stipitate base to the achene: 20
- 5 Plant perennial with a well developed and often creeping rhizome:6
Plants annual or at least short-lived:13
- 6 Female glume 7–11 mm. long usually black except for the midrib; achene ovoid to ellipsoid, 4–6 mm. long, smooth or slightly verrucose; hypogynium much reduced4. [melanomphala](#)

- Female glumes 2.5–8 mm. long; achene up to 4 mm. long:7
- 7 Male spikelets more or less curved, conspicuously spreading, 7–9 mm. long; achene glabrous, distinctly longitudinally ribbed except for the tuberculate apex; panicles contracted, spike-like [5. spiciformis](#)
- Male spikelet straight, 4–9 mm. long; achene lacking the above combination of characters; panicles lax:8
- 8 Stems up to 10 m. long, scandent; leaves scabrid; panicles erect, branches patently spreading; achenes ovoid to cylindric-ovoid, 3–3.5 mm. diam., purple, very rarely white, smooth, hairy [6. boivinii](#)
- Stems up to 2 m. long, erect or decumbent but never scandent; leaves not scabrid;9
- 9 Peduncles of the lateral panicles very short with scarcely exerted, erect panicles; male spikelet 3–4.75 mm. long; achenes 1.8–3 mm. diam., smooth, glabrous or pubescent beneath: 10
- Peduncles of the lateral panicles long, with well exerted, often pendent panicles; male spikelet 5–9 mm. long; achenes 2–2.5 mm. diam., smooth to lacunose, with tufts of fine hairs: 12
- 10 Tip of the female glume longer than the achene, recurved; achene globose to ovoid-globose, 1.8–2.4 mm. diam., smooth, shining, finely hairy beneath or all over, often purplish at the apex [7. pterota](#)
- Tip of the female glume long or short, but always straight; achene ovoid to globose or ellipsoid, up to 3 mm. diam., grey, honey-coloured or purplish at maturity: 11
- 11 Male spikelet 3–4 mm. long; fertile glume shorter than the achene; achene 2.2–2.5 mm. diam., ivory to grey at maturity [8. naumanniana](#)
- Male spikelets 4–4.75 mm. long; fertile glume with a long tip exceeding the achene; achene 2.5–3 mm. diam., the apex dark purple to blue-black at maturity [9. iostephana](#)
- 12 Lateral panicles 2–5 at each node, rarely solitary; male spikelet 5–6 mm. long; achene narrowly ovoid to subglobose, smooth or lightly striate-lacunose [10. lagoënsis](#)
- Lateral panicles solitary; male spikelet 7–9 mm. long; achene subglobose, faintly or distinctly lacunose [11. achenii](#)
- 13 Pedicel of the male spikelet equal to or longer than the spikelet; achene globose to ellipsoid, 2 mm. diam. with oblong lacunae having reddish viscid-pubescent patches on the walls [12. mikawana](#)
- Pedicel of the male spikelet much shorter than the spikelet: 14
- 14 Lateral panicles erect; peduncles rigid, usually short: 15
- Lateral panicles pendulous; peduncles long and floxuous: 17
- 15 Achene globose, 2.7–3.5 mm. diam. with deep square lacunae, hairy or glabrous [13. sphaerocarpa](#)
- Achene ovoid or ellipsoid-cylindric, glabrous: 16
- 16 Achene cylindric to ellipsoid-cylindric, 1.5–2 mm. diam. obscurely or distinctly striate-lacunose, the lacunae vertically elongated [14. tessellata](#)
- Achene ovoid to almost globose, 2–2.5 mm. diam., smooth at the apex alveolate-lacunose below, rarely so faintly as to appear almost smooth [15. foliosa](#)
- 17 Achenes smooth, glabrous: 18
- 18 Lateral panicles solitary; achene globose, compressed, 3.2–3.8 mm. diam. [16. schimperana](#)
- Lateral panicles 2 or more at least at some of the nodes; achenes oblong-cylindric, subtrigonal, 1.7–1.8 mm. diam., grey with darker longitudinal banding, shining [17. gracillima](#)
- Achenes lacunose: 19
- 19 Achene globose, 2.75–3 mm. diam., deeply lacunose, glabrous or with reddish viscid-pubescent patches on the walls; male spikelet 3–5 mm. long [18. globonux](#)
- Achene obovoid-globose to oblong-ellipsoid, 1.5–2.2 mm. diam., deeply and squarely lacunose, usually hairy on the walls; male spikelet 2.5–3.5 mm. long [19. parvula](#)
- 20 Inflorescence of terminal and lateral panicles, the latter often with foliaceous bracts; fertile spikelets androgynous or unisexual: 21
- Inflorescence of a terminal interrupted spike or panicle without foliaceous bracts; spikelets usually crowded into sessile or subsessile glomerules: 23
- 21 Leaves not more than 5 mm. broad; spikelets 4–5 mm. long; achene ovoid to ellipsoid, 2.5–3 mm. long, smooth, glabrous [20. lithosperma](#)
- Leaves 10–22 mm. broad; panicles large with simple branches; achene smooth: 22
- 22 Fertile spikelets 5–6 mm. long; achene ellipsoid or ovoid-ellipsoid, 2–2.5 mm. diam. [21. lacustris](#)
- Fertile spikelets 11 mm. long; achene subglobose, slightly compressed, 3.5–4 mm. diam. [22. chevalieri](#)
- 23 Inflorescence branched; branches few with few glomerules, or numerous and compound: 24
- Inflorescence a simple spike, very occasionally with 1 or 2 short branches bearing a single glomerule arising from the lowest glomerules: 28

- 24 Achenes subglobose, up to 1.4 mm. long, tuberculate-trabeculate; panicle loose and copiously branched: **25**
 Achenes 1.5–2 mm. long, smooth to lacunose-tessellate or striate or tuberculate, glabrous: **26**
- 25 Plants perennial with a slender rhizome; spikelets 3–5 mm. long, obtuse [23. pooides](#)
 Plants annual; spikelets 3–4 mm. long, acuminate, black [24. robinsoniana](#)
- 26 Plants annual; panicle loose and copiously branched; spikelets acute, narrowly lanceolate; achenes oblong-ellipsoid, 1.8 mm. long with a thin pericarp [25. guineensis](#)
 Plants perennial; panicle scanty; spikelets usually subobtuse, oblong-lanceolate; achene subglobose, shining: **27**
- 27 Leaf-sheath more or less truncate at the mouth; achene ovoid-globose, lacunose, faintly tessellate [26. striatinux](#)
 Leaf-sheath with a long tongue opposite the blade; achene ovoid-globose to compressed-globose, smooth or tuberculate [27. rehmannii](#)
- 28 Glomerules erect to spreading; glume glabrous to hairy but without setose bristles: **29**
 Glomerules reflexed; glumes normally densely or sparsely coated with conspicuous, often black setose bristles: **33**
- 29 Plants rhizomatous, perennial: **30**
 Plants annual: **32**
- 30 Stems bulbous-based; achene obovoid to subglobose, 1.2–1.6 mm. long, usually smooth and shining but occasionally tuberculate [28. bulbifera](#)
 Stems not bulbous-based: **31**
- 31 Achene globose, subtrigonal, 1.2 mm. diam., obscurely trabeculate with a dark line down each face [29. monticola](#)
 Achene broadly ovoid to subglobose, 1.1–1.5 mm. long, strongly trabeculate [30. dieterlinii](#)
- 32 Glumes and bracteoles with few to many setose hairs, chiefly on the midrib and margins; achene oblong-ovoid to oblong-globose, 1.2–1.6 mm. long, trabeculate [31. hirtella](#)
 Glumes and bracteoles glabrous; achene globose, compressed, sub-trigonal, 1.4–1.6 mm. long, trabeculate [32. pergracilis](#)
- 33 Plants perennial; achene subglobose to oblong-ovoid. 1.1–1.5 mm. diam., smooth or almost so: **34**
 Plants annual; achene obovoid, compressed, 1.1–1.6 mm. diam., trabeculate or rarely tuberculate: **35**
- 34 Rhizome stout and woody, at least 2 mm. thick, unbranched and giving rise to a uniseriate row of stems; basal leaf-sheaths distant, tight with a short or very short blade; achene subglobose, smooth or lightly tuberculate [33. nutans](#)
 Rhizome slender, 1–2 mm. thick, usually several per plant and the stems not conspicuously seriate; leaves tufted from the base of the plant with loose longitudinally slit sheaths and long blades; achene oblong-ovoid to oblong-globose, trabeculate [34. aterrima](#)
- 35 Glomerules subsessile usually solitary; glumes with an awn 1.5–3 mm. long [35. melanotricha](#)
 Glomerules shortly pedunculate, paired, the second one on a peduncle up to 3 mm. long; glumes mucronate or with a very short awn, not over 1 mm. long [36. grata](#)

1. *Scleria depressa* (C.B. Cl.) Nelmes in Amer. J. Bot. 39: 392 (1952). and in Kew Bull. 11: 77 (1956);
 Berhaut, Fl. Sén. ed. 2, 358 (1967). *APD acc*

Scleria racemosa var. *depressa* C.B. Cl. in F.T.A. 8: 508 (1902).

Scleria racemosa of F.W.T.A., ed. 1, 2: 493.

Scleria racemosa subsp. *depressa* (C.B. Cl.) J. Raynal in Adansonia sér. 2, 4: 153 (1964).

A stout perennial 1–2 m. high; *swamps in savanna and forest.*

Also in **E. Cameroun.**

24. CAREX

Linn., Sp. Pl. 972 (1753), and Gen. Pl. ed. 5, 420 (1754); F.T.A. 8: 514 (1902); Kükenthal in Engl., Pflanzenr. Cyperaceae—Caricoideae: 67–767 (1908).

- 1 Inflorescence with 5–10 dense cylindric spikes 4–6 cm. long on long solitary peduncles: **2**
Inflorescence a spreading or very dense panicle with numerous sessile short spikes up to 1.5 mm. long; perennials with pale brown or straw-coloured sheaths to the lower leaves: **3**
- 2 Terminal spike male, usually with some utricles in the upper part; spikes 3–6; perennial with pale brown or straw-coloured sheaths to the lower leaves [1. preussii](#)
Terminal spike male throughout, lateral spikes female or the upper ones with some male flowers at the apex; spikes more numerous; perennial with rich purplish-red sheaths to the lower leaves [2. mannii](#)
- 3 Panicle lax: **4**
Panicle very dense, almost spike-like [6. lycurus](#)
- 4 Glumes broadly acute with a 1–2 mm. long scabrid awn; panicle scanty; utricle sparingly ciliolate above [3. neo-chevalieri](#)
Glumes acuminate or with a short smooth or scabrid awn not exceeding 1 mm. long; panicle much branched; utricle glabrous: **5**
- 5 Utricle 3 mm. long including the stout 0.75 mm. long beak [4. echinochloë](#)
Utricle 4.5–5 mm. long including the slender 1.5–2 mm. long beak 5. chlorosaccus

1. *Carex preussii* K. Schum. in Engl., Bot. Jahrb. 24: 340 (1897).

APD: *Synonym of Carex petitiana A. Rich.*

Carex simensis of F.T.A. 8: 522, partly; F.W.T.A., ed. 1, 2: 495.

Carex preussii var. **camerunensis** *Nelmes* in Kew Bull. 1938: 247.

Carex longipedunculata var. **preussii** (*K. Schum.*) *Kük.* l. c. 652 (1909).

Tufted perennial 30–100 cm. high with scanty inflorescence; spikelets usually rust and green, but sometimes redder; **in upland forest.**

N. Nig.: Gotel Mts., Mambila Plateau Tuley 2033! **W. Cam.:** Cam. Mt. (Dec.) Mann 2099! Ukile, Mann's Spring (Mar.) Brenan & Onochie 9538! Bafut-Ngemba F.R., Bamenda (Feb.) Hepper 2085! Mba Kokeka, Bamenda (Mar.) Coombe 229! L. Oku, Bamenda (Jan.) Keay & Lightbody FHI 28465!

2. **Carex mannii** *E. A. Bruce* in Kew Bull. 1933: 150. *APD acc*

Carex boryana of F.T.A. 8: 523, not of Schkuhr.

Carex boryana var. **simplicissima** *Kük.* l.c. 651 (1909).

Tufted perennial up to 140 cm. high with 6–10 solitary dark reddish brown spike; **in forest**.

W. Cam.: Ukele Camp, Cam. Mt., 6,000 ft. (Feb.) Maitland 1341! **F. Po:** (Dec.) Boughey GC 10794! St. Isabel Peak Guinea 2683! Clarence Peak, 7,500–8,500 ft. (June–Dec.) Mann 661! 1478 !

Also in **eastern Africa**.

3. **Carex neo-chevalieri** *Kük.* in Bull. Mus. Nat. Hist. Paris sér. 2, 3: 467 (1931). *APD acc*

Carex echinochloe of F.W.T.A., ed. 1, 2: 495, partly.

Tufted perennial 60–100 cm. high with scanty panicles of light brown spikes with glabrous or shortly hairy glumes; **upland forests, rarely below 4,000 ft.**

Guin.: La Sala Falls (Oct.) Pitot! **Mali:** (Nov.) Chev. 37803! **S. L.:** Séréleu Massif (Sept.) Jaeger 7665! Bintimani Mts., 4,600 ft. (July) Bakshi 283! **Ghana:** Shiare, Togo Hills (Nov.–Dec.) Also from E. Cameroun and C. African Republic to Burundi.

4. **Carex echinochloë** *G. Kunze* Suppl. Schkuhr's Riedgr. 47, t. 12 (1841); F.T.A. 8: 518; *Kük.* l.c. 270 (1909); F.W.T.A., ed. 1, 2: 495, partly, excl. synonymy. *APD acc*

Tufted perennial about 1 m. high with simple or compound panicles of short greenish spikes; utricles ciliolate; **forests and shade, 5,500–8,000 ft.**

W. Cam.: Cam. Mt., 7,000 ft. (Jan., Nov.) Mann 1359! 2106! Mann's Spring, Cam. Mt. (June, Dec.) Mildbraed! Boughey GC 12609! Bafut-Ngemba F.R., Bamenda, 7,300 ft. (Feb.) Hepper 2191! L. Bambulue, 5,500 ft. (July) Bumpus 46/Bam/29!

Also on mountains in eastern and north-eastern Africa.

5. **Carex chlorosaccus** *C.B. Cl.* in J. Linn. Soc. 34: 298 (1899); F.T.A. 8: 519. *APD acc*

Carex echinochloë var. **chlorosaccus** (*C.B. Cl.*) *Kük.* l.c. 271 (1909).

Tufted perennial sedge 60–100 cm. high with pale brown or greenish basal leaf-sheaths and much branched panicles with short green spikes; **montane forest 6,000–8,000 ft.**

F. Po: S.W. of L. Biaó (Sept.) Wrigley & Melville 663! Clarence Peak, 6,000–8,000 ft. (Dec.) Boughey 126! Mann 653!

Also in **eastern tropical Africa** and **northern tropical Africa**.

6. **Carex lycurus** *K. Schum.* in Engl., Pflanzenw. Ost-Afrika C: 129 (1895); F.T.A. 8: 517; *Kük.* l.c. 127. *APD acc*

Perennial 30–60 cm. high with a long creeping rhizome, pale brown basal leaf-sheaths and a dense, light yellowish brown inflorescence; **montane forests 7,000–8,000 ft.**

W. Cam.: Bambili Lakes, Mezam Division (May) Bauer 67!

Also **east tropical Africa** and **north-east tropical Africa**.

[The inflorescence of this specimen is very immature but apart from a slightly smaller and more slender habit than is usually met with on the mountains of East Africa there are no significant differences.]

GRAMINEAE

Annual or perennial herbs, rarely shrubs or trees, sometimes with rhizomes or stolons; stems erect, ascending or creeping, usually branched at the base, in perennials with sterile shoots and flowering stems (culms) mixed, in annuals only the latter present; culms cylindrical, rarely flattened, jointed, usually hollow in the internodes, closed at the nodes; branches subtended by a leaf, and with a 2-keeled hyaline leaflet (prophyll) at the base. Leaves solitary at the nodes, sometimes crowded at the base of the stem, alternate and 2-rowed, consisting of sheath, ligule and blade; sheaths encircling the culm, with the margins free and overlapping or \pm connate, frequently swollen at the base, the shoulders sometimes extended upwards into triangular auricles; ligule adaxial, placed at the junction of sheath and blade, membranous or reduced to a fringe of hairs, rarely absent (very rarely with a similar abaxial structure—the external ligule); blades usually long and narrow, rarely broad, flat or sometimes rolled or terete, parallel-nerved, rarely with transverse connections, usually passing gradually into the sheath, sometimes amplexicaul or with falcate auricles, rarely narrowed into a false petiole or articulated with the sheath. Inflorescence made up of spikelets arranged in a panicle, or in spikes or racemes, these either solitary, digitate, or disposed along a central axis; usually terminal, sometimes (especially in Andropogoneae) numerous, each inflorescence being subtended by a bladeless sheath (spatheole) and the whole flowering branch system condensed into a leafy false panicle. Spikelets consisting of bracts distichously arranged along a slender axis (rhachilla); the two lower bracts (glumes) empty; the succeeding 1 to many bracts (lemmas) each enclosing a flower and opposed by a hyaline scale (palea), the whole (lemma, palea and flower) termed a floret; base of spikelet or floret sometimes with a horny prolongation downwards (callus); glumes or lemmas often bearing 1 or more stiff bristles (awns); this basic pattern of spikelet structure consistent throughout the family, though often much modified by reduction, suppression or elaboration of parts. Flowers usually bisexual, sometimes unisexual, small and inconspicuous; perianth represented by 2, rarely 3, minute hyaline or fleshy scales (lodicules); stamens hypogynous, 1–6, rarely more, usually 3, with delicate filaments and 2-theous anthers opening by a longitudinal slit or rarely a terminal pore; ovary 1-locular, with 1 anatropous ovule often adnate to the adaxial side of the carpel; styles usually 2, rarely 1 or 3, generally with plumose stigmas. Fruit mostly a caryopsis with thin pericarp adnate to the seed, rarely with free seed, still more rarely a nut or berry; caryopsis commonly combined with various parts of the spikelet, or less often the inflorescence, to form a false fruit; seed with starchy endosperm, an embryo at the base of the abaxial face, and a point or line (hilum) on the base or adaxial face marking the connection between pericarp and seed.

About 660 genera and 9,000 species, in 50–60 tribes; throughout the world.

KEY TO THE TRIBES

- 1 Spikelets 1- to many-flowered, breaking up at maturity above the more or less persistent glumes, or if falling entire then not 2-flowered with the lower floret male or barren and the upper female or hermaphrodite; spikelets usually laterally compressed or terete.....2
- Spikelets 2-flowered, falling entire at maturity, with the upper floret (of fertile spikelets) female or hermaphrodite and the lower male or barren and in the latter case often much reduced; spikelets usually dorsally compressed: 27
- 2 Spikelets unisexual, dissimilar, the sexes mixed or in different parts of the same inflorescence:3
- Spikelets bisexual, similar:4
- 3 Leaf-blades with the lateral nerves parallel to the midrib; <Image p="female"> lemma indurated, shorter than the glumes [2. OLYREAE](#)
- Leaf-blades with slanting lateral nerves running obliquely from the midrib to the margin; <Image p="female"> lemma papery, much longer than the glumes [3. PHAREAE](#)
- 4 Tall woody bamboos, less often perennial herbs; leaf-blades flat, lanceolate to ovate, many-nerved, often with transverse veins, usually with a petiole-like base and articulated with the sheath; lemmas several, 5- to many-nerved, awnless; lodicules usually 3 [1. BAMBUSEAE](#)
- Perennial or annual herbs with herbaceous culms; leaf-blades usually sessile and not articulated with the sheath, or if with a petiole-like base then not with the other characters given above:5
- 5 Spikelets borne on opposite sides of the rhachis of solitary spikes or racemes, the spikelets placed broadside on to

- the rhachis: **6**
- Spikelets in panicles or 1-sided spikes or racemes; very rarely on opposite sides of the rhachis of solitary spikes, but then edgeways on with the back of the lemmas pressing against the rhachis: **7**
- 6** Spikelets borne upon a pedicel 1.5 mm. long, several-flowered [8. BRACHYPODIEAE](#)
- Spikelets quite sessile, or single-flowered [9. TRITICEAE](#)
- 7** Leaf-blades transversely veined between the main nerves, narrowly lanceolate to ovate; spikelets several-flowered: **8**
- Leaf-blades without transverse veins, linear: **9**
- 8** Spikelets in a 1-sided raceme; lemmas awned [4. STREPTOGYNEAE](#)
- Spikelets in a panicle; lemmas awnless [16. CENTOTHECEAE](#)
- 9** Lemmas deeply cleft into 9 lobes or awns [17. PAPPOPHOREAE](#)
- Lemmas entire or bilobed, rarely 3-awned: **10**
- 10** Spikelets containing 2 or more fertile florets (except *Leptochloa uniflora*): **11**
- Spikelets with 1 fertile floret (very rarely more, *Tetrapogon*, and then with long-ciliate lemmas), with or without 1 or 2 male or barren florets below it, and 1 or more above: **21**
- 11** Rhachilla internodes bearing long silky hairs which envelop the lemmas, the latter glabrous (in only W. African genus); tall grasses with large plume-like panicles [13. ARUNDINEAE](#)
- Rhachilla internodes glabrous or shortly hairy, in the latter case with the hairs not enveloping the lemmas: ... **12**
- 12** Florets 2 per spikelet, one or both of the florets hardened or leathery; spikelets awnless [24. ISACHNEAE](#)
- Florets nearly always 3 or more per spikelet; lemmas membranous or awned: **13**
- 13** Inflorescence made up of racemes either solitary, digitate or scattered along an axis [19. ERAGROSTIDAE](#)
- Inflorescence an open or contracted panicle, or globose cluster: **14**
- 14** Glumes shorter than the lowest floret with the upper florets distinctly exerted; lemmas awnless or with straight awns from the entire, or lobed tip: **15**
- Glumes longer than the lowest floret, usually as long as the spikelet and enclosing the florets, rarely shorter but then the lemmas with geniculate awns; lemmas 5- to many-nerved: **20**
- 15** Lemmas 1–3-nerved: **16**
- Lemmas 5 to many-nerved: **17**
- 16** Spikelets awnless [19. ERAGROSTIDAE](#)
- Spikelets awned [14. DANTHONIEAE](#)
- 17** Lemmas bearing long slender awns, closely coiled and entangled towards the tips (in the only West African genus) [10. MELICEAE](#)
- Lemmas awnless or with stiff straight awns: **18**
- 18** Spikelets densely imbricate in short globose or oblong heads [18. AELUROPODEAE](#)
- Spikelets arranged in open or contracted panicles: **19**
- 19** Ovary glabrous or hairy, the styles arising from its tip; lemmas awnless or awned from the tip (except *Festuca mekiste* which has glabrous leaf-sheaths and scabrid palea keels) [6. POEAE](#)
- Ovary crowned by a fleshy hairy cap, the styles arising from beneath the latter; lemmas awned from just below the tip (leaf-sheath hairy and palea keels ciliate in W. African species) [7. BROMEAE](#)
- 20** Lemmas with a geniculate dorsal awn, rarely awnless (and then with pubescent inflorescence axis, otherwise see *Festuca*); ligule membranous [11. AVENEAE](#)
- Lemmas with a straight or geniculate awn from the sinus of the prominently 2-lobed tip; ligule a ciliate fringe [14. DANTHONIEAE](#)
- 21** Glumes very minute or suppressed (in *Oryza* 2 sterile lemmas at the base of the floret simulate glumes, the true glumes being barely discernable as minute collars at the tip of the pedicel); palea 3-nerved, similar to the lemma in texture; stamens often 6; spikelets laterally compressed [5. ORYZEAE](#)
- Glumes usually well-developed, or at least the upper; palea usually 2-nerved and hyaline; stamens 3 or less; spikelets usually not flattened: **22**
- 22** Spikelets falling entire at maturity, either singly or in clusters, from the persistent axis of slender spike-like panicles or racemes [22. ZOYSIEAE](#)
- Spikelets breaking up at maturity above the persistent glumes (rarely embedded in a segment of the fragile rhachis and falling with it): **23**
- 23** Inflorescence made up of racemes or spikes (solitary or digitate in the West African species) [20. CHLORIDEAE](#)
- Inflorescence a panicle, either open or contracted and spiciform: **24**

-
- 24 Florets 2, the lower barren or male, the upper hermaphrodite[23. ARUNDINELLEAE](#)
 Floret 1: 25
- 25 Spikelets awnless[21. SPOROBOLAEAE](#)
 Spikelets awned (in the West African species): 26
- 26 Awn divided into 3 branches (except *Aristida diminuta*); lemma terete and rigid at maturity; ligule ciliate ..[25. ARISTIDEAE](#)
 Awn entire; ligule membranous[12. AGROSTIDEAE](#)
- 27 Spikelets all hermaphrodite, or with male or barren and hermaphrodite spikelets mixed in the same inflorescence: 28
 Spikelets unisexual, the male and female spikelets in separate inflorescences or in different parts of the same inflorescence[27. MAYDEAE](#)
- 28 Spikelets solitary, rarely paired with the spikelets all more or less similar; glumes usually membranous, the lower usually smaller or sometimes suppressed: upper lemma papery to polished and stony, usually awnless[25. PANICEAE](#)
 Spikelets typically paired, with 1 sessile and the other pedicelled, those of each pair usually dissimilar in shape and sex (the pedicelled sometimes much reduced), rarely with the spikelets all alike; glumes as long as the spikelets and enclosing the florets, more or less rigid and firmer than the hyaline or membranous lemmas; upper lemma often with a geniculate awn[26. ANDROPOGONEAE](#)

KEY TO THE GENERA

Tribe 1—BAMBUSEAE

- 1 Tall woody bamboos with culms up to 12 m. high:2
 Herbaceous plants with culms up to about 1 m. high:4
 2 Stamens 3, filaments free; leaf-blades attenuate to a filiform tip about 10 mm. long [1. *Arundinaria*](#)
 Stamens 6, leaf-blades acuminate to a pungent tip about 5 mm. long:3
 3 Filaments free; mouth of leaf-sheath auriculate, glabrous [2. *Bambusa*](#)
 Filaments united; mouth of leaf-sheath without auricles, long-ciliate [3. *Oxytenanthera*](#)
 4 Spikelets linear, with several to many bisexual florets, the rhachilla distinct; filaments of stamens free4.
 [4. *Guadua*](#)
 Spikelets narrowly ovate, with 3–5 male and a terminal female floret, the rhachilla represented by a rounded
 callus at the base of each floret; filaments of stamens united [5. *Puelia*](#)

Tribe 2—OLYREAE

- 1 Only West African genus [6. *Olyra*](#)

Tribe 3—PHAREAE

- 1 Only West African genus [7. *Leptaspis*](#)

Tribe 4—STREPTOGYNEAE

- 1 Only genus [8. *Streptogyna*](#)

Tribe 5—ORYZAE

- 1 Spikelets with 2 reduced sterile lemmas at the base of the fertile floret; fertile lemma coriaceous [9. *Oryza*](#)
 Spikelets without sterile lemmas; fertile lemma papery [10. *Leersia*](#)

Tribe 6—POEAE

Lemmas awned, rounded on the back or only keeled at the tips:

- Perennial; lemmas lanceolate to oblong [11. *Festuca*](#)
 Annual; lemmas linear-lanceolate [12. *Vulpia*](#)
 Lemmas awnless, compressed and keeled [13. *Poa*](#)

Tribe 7—BROMEAE

- 1 Only West African genus [14. *Bromus*](#)

Tribe 8—BRACHYPODIEAE

- 1 Only West African genus [15. *Brachypodium*](#)

Tribe 9—TRITICEAE

- 1 Spikelets solitary at each node of the rhachis, several-flowered [16. *Triticum*](#)
 Spikelets in clusters of three at each node, one-flowered [17. *Hordeum*](#)

Tribe 10—MELICEAE

- 1 Only West African genus [18. *Streblochaete*](#)

Tribe 11—AVENEAE

- 1 Lemmas awnless or mucronate [19. *Koeleria*](#)
 Lemmas long awned:2
 2 Annual; Spikelets 2-flowered; rhachilla glabrous; lemmas 2-toothed at apex [20. *Aira*](#)
 Perennials; Spikelets 2–6-flowered; rhachilla more or less hairy:3
 3 Lemma bifid at the tip, awned from the middle or above the middle of the back [21. *Helictotrichon*](#)
 Lemma 4-toothed at the tip, awned from near the base of the back [22. *Deschampsia*](#)

Tribe 12—AGROSTIDEAE

- 1 Glumes 1–3-nerved; lemma hyaline at maturity, truncate or denticulate truncate with percurrent nerves23.
 [23. *Agrostis*](#)
 Glumes 5-nerved; lemma indurated and rigid at maturity, 2-toothed at apex [24. *Hypseochloa*](#)

Tribe 13—ARUNDINEAE

- 1 Only West African genus [25. *Phragmites*](#)

Tribe 14—DANTHONIEAE

- 1 Spikelets in open or contracted panicles:2

- Spikelets in globose clusters, these sometimes confluent into a cylindrical spike [29. *Elytrophorus*](#)
- 2 Lemmas 5—many-nerved; glumes as long as the spikelet: **3**
- Lemmas 3-nerved and 3-awned; glumes shorter than the spikelet [28. *Triraphis*](#)
- 3 Lobes of the lemma acute, transversely bearded at their base; glumes 5–11-nerved; spikelets 2–6-flowered ... [26. *Asthenatherum*](#)
- Lobes of the lemma produced into a fine bristle, not boarded; glumes 1–3-nerved; spikelets 2-flowered [27. *Pentaschistis*](#)
- Tribe 15—ARISTIDEAE**
- 1 Awns, at least the central one, plumose; column more or less developed, articulated at its base .. [30. *Stipagrostis*](#)
- Awns never plumose [31. *Aristida*](#)
- Tribe 16—CENTOTHECEAE**
- 1 Spikelets mostly 3-flowered; upper lemmas with reflexed bristles [32. *Centotheca*](#)
- Spikelets mostly 10–20-flowered; lemmas glabrous [33. *Megastachya*](#)
- Tribe 17—PAPPOPHOREAE**
- 1 Lemmas divided into 9 awns; fertile floret 1 [34. *Enneapogon*](#)
- Lemmas divided into 4 membranous lobes alternating with 5 awns; fertile florets usually 4 or more [35. *Schmidtia*](#)
- Tribe 18—AELUROPODEAE**
- 1 Only genus [36. *Aeluropus*](#)
- Tribe 19—ERAGROSTIDEAE**
- 1 Spikelets pedicelled in open or contracted panicles [37. *Eragrostis*](#)
- Spikelets sessile or very short-pedicelled in secund 2-rowed spikes: **2**
- 2 Spikes solitary and terminal; ligule ciliate [38. *Tripogon*](#)
- Spikes digitate or scattered along an axis: **3**
- 3 Lemmas conspicuously ciliate on the margins [39. *Trichoneura*](#)
- Lemmas glabrous or apparently so (pubescent at the base beside the keel in *Bewsia*): **4**
- 4 Racemes deciduous at maturity with the spikelets attached [40. *Dinebra*](#)
- Racemes not deciduous: **5**
- 5 Spikes digitate or subdigitate: **6**
- Spikes scattered on a long central axis: **9**
- 6 Spikes terminating in a sharp point [41. *Dactyloctenium*](#)
- Spikes terminating in a spikelet: **7**
- 7 Lemmas drawn out into a short awn-point; racemes whorled on a short common axis [42. *Acrachne*](#)
- Lemmas at most acute: **8**
- 8 Glumes strongly keeled, the spikelets laterally compressed [43. *Eleusine*](#)
- Glumes rounded on the back, the spikelets plump [44. *Coelachyrum*](#)
- 9 Awn of the lemma dorsal; callus bearded [45. *Bewsia*](#)
- Awn of the lemma (if any) apical or from between 2 teeth: **10**
- 10 Ligule reduced to a line of hairs [46. *Pogonarthria*](#)
- Ligule hyaline: **11**
- 11 Lemmas acuminate to a short awn-point; spikelets laterally compressed [42. *Acrachne*](#)
- Lemmas obtuse to acute, sometimes mucronate but then not compressed: **12**
- 12 Spikelets 2–3 mm. long, 1–6-flowered, laterally compressed [47. *Leptochloa*](#)
- Spikelets 5–9 mm. long, 6–10-flowered, more or less terete [48. *Diplachne*](#)
- Tribe 20—CHLORIDEAE**
- 1 Spikelets with 1 (except *Tetrapogon*) fertile and 1 or more imperfect florets: **2**
- Spikelets with 1 fertile floret and no imperfect florets: **6**
- 2 Fertile floret with 2 imperfect florets below and one above it; upper glume with an oblique dorsal awn [49. *Ctenium*](#)
- Fertile floret with imperfect florets only above it; upper glume without a dorsal awn: **3**
- 3 Fertile florets 2–4; lemma villous, broadly ovate; raceme usually solitary [50. *Tetrapogon*](#)

- Fertile floret 1:4
- 4 Spikes usually 2 or more:5
- Spikes solitary; lemma narrow, glabrous or scaberulous53. *Enteropogon*
- 5 Glumes unequal, the lower shorter than the florets51. *Chloris*
- Glumes equal or nearly so, as long as or slightly longer than the florets62. *Chrysochloa*
- 6 Spikelets with flexuous awns about 3 cm. long54. *Schoenefeldia*
- Spikelets awnless or with a short stiff awn up to 0.5 cm. long:7
- 7 Upper and lower glumes much compressed laterally and both keeled:8
- Upper glume with a flat back, the lower boat-shaped or much reduced; spikes solitary:9
- 8 Glumes longer than the floret and enclosing it; spike solitary55. *Brachyachne*
- Glumes shorter than the floret; spikes digitate56. *Cynodon*
- 9 Lower (adaxial) glume present; spikelets arranged on one side of the slender rhachis, not sunken, awnless57. *Microchloa*
- Lower glume absent (except for the terminal spikelet); spikelets sunk in hollows on opposite sides of the rhachis, awned or awnless58. *Oropetium*

Tribe 21—SPOROBOLAEAE

- 1 Inflorescence a panicle, rarely spike-like59. *Sporobolus*
- Inflorescence an ovoid head60. *Crypsis*

Tribe 22—ZOYSIEAE

- 1 Glumes long and finely awned; spikelets solitary61. *Perotis*
- Glumes awnless:2
- 2 Spikelets clustered on short branches, those densely crowded into a narrow cylindrical inflorescence; lower glume very small or suppressed, the upper armed with hooked spines on the back62. *Tragus*
- Spikelets paired or solitary on flattened cuneiform branches 2–5 mm. long, these distant along a central axis; both glumes prominent, smooth on the back or the upper tuberculate, their margins pectinate 63. *Leptothrium*

Tribe 23—ARUNDINELLEAE

- 1 Callus of upper floret pungent, 3–3.5 mm. long; spikelets 26–28 mm. long in groups of three; lower lemma 5–7-nerved64. *Tristachya*
- Callus of upper floret obtuse, truncate, 2-toothed or obliquely 1-toothed:2
- 2 Lemma of upper floret scabrid or scaberulous, the callus very short and broadly rounded; spikelets paired or solitary65. *Arundinella*
- Lemma of upper floret usually hairy, or if glabrous then quite smooth:3
- 3 Spikelets in close clusters of 3, the pedicels distinct and 1–3 mm. long; rarely in groups of 2–3 on longer pedicels, but then the lobes of the upper lemma awned and the callus linear (0.7–1 mm. long) 66. *Loudetiopsis*
- Spikelets paired or solitary:4
- 4 Upper lemma evenly pubescent or pilose, rarely glabrous; callus oblong to linear, 0.5–1 mm. long, truncate, 2-toothed, or obliquely 1-toothed; lower lemma 3-nerved (except *L. togoensis*)67. *Loudetia*
- Upper lemma transversely bearded or with a tuft of hairs near each margin; callus short and obtuse:5
- 5 Lower lemma 5–9-nerved; upper lemma lobes acute68. *Danthoniopsis*
- Lower lemma 3-nerved; upper lemma awned from the lateral lobes, with a tuft of hair near each margin69. *Trichopteryx*

Tribe 24—ISACHNEAE

- 1 Spikelets arranged in panicles70. *Isachne*
- Spikelets arranged in one-sided spikes71. *Heteranthoecia*

Tribe 25—PANICEAE

- 1 Spikelets falling singly, not subtended by bristles, or if so then the bristles persisting on the axis after the spikelets have fallen (to p. 356):2
- Spikelets falling singly or in clusters, surrounded by 1 or more bristles which fall with the spikelets; if without bristles, then falling in clusters:28
- 2 Inflorescence an open or spike-like panicle (rarely the branchlets contracted about the primary branches—*Panicum laxum*):3
- Inflorescence consisting of one-sided spikes or racemes, these either digitate or scattered along a central axis, rarely solitary; the racemes sometimes with short secondary racemelets (especially *Echinochloa crus-gavonis*)

- and *Entolasia olivacea*) or with the spikelets long-pedicelled and distant (*Brachiaria deflexa*): 10
- 3 Spikelets, or some of them, subtended by one to many long bristles [72. *Setaria*](#)
 Spikelets not subtended by bristles: 4
- 4 Spikelets arranged in cylindrical spike-like panicles [73. *Sacciolepis*](#)
 Spikelets arranged in open or contracted panicles: 5
- 5 Lower lemma entire at the tip, awnless; upper lemma crustaceous: 6
 Lower lemma bilobed at the tip; upper lemma leathery or chartaceous: 8
- 6 Spikelets distinctly gibbous and laterally compressed [74. *Cyrtococcum*](#)
 Spikelets not gibbous (sometimes slightly so, but then not laterally compressed): 7
- 7 Upper floret without lateral basal wings or scars [75. *Panicum*](#)
 Upper floret with lateral basal wings or soars [80. *Ichnanthus*](#)
- 8 Spikelets clothed in silky hairs extending beyond the tip of the spikelet (in West African species); upper glume gibbous or straight on the back; lower lemma shortly awned [95. *Rhynchelytrum*](#)
 Spikelets glabrous or at most pubescent; upper glume more or less straight on the back: 9
- 9 Upper glume narrower than the lower lemma, the latter awnless; upper lemma leathery [96. *Tricholaena*](#)
 Upper glume wider than the lower lemma, the latter usually awned; upper lemma thinner, chartaceous [97. *Melinis*](#)
- 10 Racemes very short, bearing 1–5 spikelets, and sunken in hollows in a thickened corky rachis, the latter disarticulating at maturity with the spikelets attached; lower glume abaxial; both lemmas coriaceous [76. *Stenotaphrum*](#)
 Racemes free, usually bearing numerous spikelets: 11
- 11 Upper lemma hard, crustaceous or coriaceous, usually with narrow inrolled margins and exposing much of the palea: 12
 Upper lemma thinly cartilaginous, usually with flat thin margins covering much of the palea: 26
- 12 Glumes and lemmas with laterally compressed thickened apices; lower glume abaxial [77. *Acroceras*](#)
 Glumes and lower lemma obtuse to acuminate or awned, but not thickened and laterally compressed at the tip: 13
- 13 Leaf-blades broadly lanceolate to ovate-elliptic, with distinct transverse veins below; spikelets glabrous, awnless; back of upper lemma glabrous: 14
 Leaf-blades linear to lanceolate, transverse veins absent (or if present then spikelets not as above); upper lemma without basal wings: 16
- 14 Upper glume half as long as the spikelet [78. *Microcalamus*](#)
 Upper glume as long as the spikelet: 15
- 15 Base of upper lemma rounded, without lateral wings [79. *Commelinidium*](#)
 Base of upper lemma extended into a short stipe flanked by hyaline wings [80. *Ichnanthus*](#)
- 16 Spikelets laterally compressed: 17
 Spikelets dorsally compressed: 18
- 17 Spikelets lanceolate, hairy with stiff bristles based in yellowish tubercles [81. *Chloachne*](#)
 Spikelets obliquely ovate, the upper glume gibbous towards the base and usually clothed in hooked hairs when mature [82. *Pseudechinolaena*](#)
- 18 Spikelet with a bead-like swelling at its base, formed from the swollen lowest rhachilla-internode covered by the thin lower glume; upper lemma obtuse, mucronate (if not mucronate see *Brachiaria callopus*) ... [83. *Eriochloa*](#)
 Spikelet passing smoothly into the pedicel without a bead-like swelling: 19
- 19 Lower glume present: 20
 Lower glume absent: 25
- 20 Glumes acuminate or awned, or if not then the spikelets sessile in 4 rows; upper lemma not obtuse and mucronate: 21
 Glumes obtuse to acute, if acuminate then with the upper lemma mucronate; spikelets usually in 1–2 rows, sometimes irregularly arranged with some of the spikelets pedicelled: 22
- 21 Racemes 1–2-rowed; culms creeping or ascending; leaf-blades lanceolate [84. *Oplismenus*](#)
 Racemes 4 or more rowed; culms erect or suberect, sometimes floating; leaf-blades linear [85. *Echinochloa*](#)
- 22 Lower glume abaxial (facing away from the rachis); spikelets solitary, sessile (in West African spp.): 23

- Lower glume adaxial (facing towards the rhachis), or with some of the spikelets pedicelled: **25**
- 23** Upper lemma acute; spikelets glabrous [86. *Paspalidium*](#)
Upper lemma obtuse, mucronate; spikelets hairy [87. *Urochloa*](#)
- 24** Upper lemma glabrous, usually shiny or rugose [88. *Brachiaria*](#)
Upper lemma hairy [89. *Entolasia*](#)
- 25** Back of upper lemma facing axis; spikelets plano-convex, ovate to orbicular [90. *Paspalum*](#)
Back of upper lemma turned away from axis; spikelets lanceolate [91. *Axonopus*](#)
- 26** Spikelets awned: **27**
Spikelets awnless, very rarely with an awnlet up to 1.5 mm. long; lower glume (if present) abaxial, very small
..... [94. *Digitaria*](#)
- 27** Upper glume and lower lemma with fine entangled awns 15 mm. long; upper lemma awnless; lower glume
adaxial [92. *Acritochaete*](#)
Upper glume and lower lemma awnless, or with an awn point up to 1 mm. long; upper lemma awned; lower
glume abaxial; spikelets in untidy groups of 2–3 [93. *Alloteropsis*](#)
- 28** Spikelets in clusters of 3–9, not surrounded or subtended by bristles; lower glume indurated [98. *Antheophora*](#)
Spikelets surrounded or subtended by 1 to many bristles; lower glume not indurated: **29**
- 29** Bristles solitary below each spikelet: **30**
Bristles few to many, forming an involucre around the solitary or clustered spikelets: **31**
- 30** Racemes loose; spikelets 6–12 mm. long; peduncles 2–15 mm. long and falling with the spikelet [99. *Paratheria*](#)
Racemes dense; spikelets about 3 mm. long; peduncles up to 1 mm. long and remaining on the axis after the
spikelet has fallen [100. *Beckeropsis*](#)
- 31** Bristles free to the base, fine to very fine, more or less filiform [101. *Pennisetum*](#)
Bristles connate at base or to beyond the middle, rigid or spinous, at least the longest bristles flattened at the base
..... [102. *Cenchrus*](#)

Tribe 26—ANDROPOGONEAE

- 1** Internodes of rhachis and pedicels slender, filiform or linear, rarely thickened upwards and then with the upper
lemma awned: **2**
Internodes of the rhachis and pedicels stout, 3-angled, rounded, or flattened and thickening upwards; upper
lemma awnless: **30**
- 2** Racemes arranged in panicles with a common axis longer than the lowest raceme, not supported by spathes;
pedicels solid: **3**
Racemes solitary, paired or sub-digitate, and usually supported by spathes (very rarely the lowest racemes
overtopped by the common axis, but then the pedicels with a translucent middle line): **9**
- 3** Spikelets of each pair alike, enveloped or subtended by long hairs from the callus: **4**
Spikelets of each pair different, sometimes the pedicelled modified or suppressed: **6**
- 4** Spikelets all pedicelled; panicle spiciform, the rhachis continuous and tough [103. *Imperata*](#)
Spikelets paired, with 1 sessile and the other pedicelled; rhachis fragile: **5**
- 5** Panicle large and broad, silvery, the racemes long, flexuous and densely overlapping [104. *Saccharum*](#)
Panicle narrow, fulvous, of several short racemes scattered along a central axis [105. *Eriochrysis*](#)
- 6** Spikelets dorsally compressed; lower glume more or less flattened on the back: **7**
Spikelets laterally compressed or terete; lower glume rounded on the back: **8**
- 7** Pedicelled spikelets present [106. *Sorghum*](#)
Pedicelled spikelets suppressed, but pedicels present [107. *Sorghastrum*](#)
- 8** Racemes reduced to 1 sessile and 2 pedicelled spikelets [108. *Chrysopogon*](#)
Racemes composed of many pairs of spikelets [109. *Vetiveria*](#)
- 9** Fertile lemma awned from low down on the back; leaf-blades lanceolate, cordate-amplexicaul at the base .. [110. *Arthraxon*](#)
Fertile lemma awned from the tip, or the sinus of the 2-toothed tip, rarely awnless: **10**
- 10** Awn from the tip of the narrow fertile lemma: **11**
Awn from the sinus of the 2-toothed fertile lemma, rarely entire (*Schizachyrium pulchellum*, *S. scintillans*), or
awnless: **17**
- 11** Racemes digitate, or racemosely arranged on p. common axis; lower glume of sessile spikelet flat on the back,
the margins sharply involute; awn glabrous or puberulous; callus obtuse: **12**

- Racemes solitary or paired: 14
- 12 Sessile spikelets of all the pairs hermaphrodite and awned; internodes and pedicels with a translucent middle line; lower glume of sessile spikelets pitted (in West African species) [111. *Bothriochloa*](#)
- Sessile spikelets of the lowest 1–3 pairs male or barren and awnless; lower glume of sessile spikelets not pitted: 13
- 13 Internodes and pedicels solid; racemes ascending or divergent [112. *Dichanthium*](#)
- Internodes and pedicels with a translucent middle line; racemes nodding [113. *Euclasta*](#)
- 14 Lower glume of sessile spikelet with a deep circular pit on the back, sharply inflexed on the margins; awn glabrous; callus obtuse [114. *Eremopogon*](#)
- Lower glume of sessile spikelet without a pit, rounded on the back; awn pubescent to pilose; callus pungent: 15
- 15 Racemes composed of a single awned sessile spikelet and 2 pedicelled spikelets, enclosed by an involucre of 4 sterile spikelets [115. *Themeda*](#)
- Racemes composed of more than 3 pairs: 16
- 16 Upper spikelet of each pair awned and coriaceous; only the lowermost pair of spikelets homogamous; rhachis of racemes tough, flexuous [116. *Trachypogon*](#)
- Upper spikelet of each pair awnless and herbaceous, the other awned and sessile; lower 1–10 pairs homogamous, the rhachis fragile above them; racemes solitary; callus pungent [117. *Heteropogon*](#)
- 17 Lower glume of sessile spikelets transversely rugose; pedicelled spikelets reduced to the narrow curved pedicel; lower floret male [118. *Thelepogon*](#)
- Lower glume of sessile spikelets smooth, rarely rugose and then the pedicelled spikelet well developed: 18
- 18 Callus of sessile spikelet inserted into the crateriform or cupuliform tip of the internode, at least the rim of the internode lapping over and concealing the tip of the callus; lower glume of the sessile spikelets 2-keeled or with the margins sharply inflexed, and usually depressed between the keels, rarely the keels rounded but then deeply grooved between them: 19
- Callus of sessile spikelet applied obliquely to the apex of the internode with its tip free, usually acute to pungent; lower glume of sessile spikelet convexly rounded on the back without keels (rarely with a median groove); internodes and pedicels linear: 25
- 19 Lower floret of sessile spikelets male, with a palea; internodes of rhachis and pedicels more or less stout; callus of sessile spikelets obtuse: 20
- Lower floret of sessile spikelet barren and reduced to the lemma: 21
- 20 Racemes paired or digitate; upper glume of sessile spikelet awnless; awn of upper lemma glabrous; internodes of rhachis and pedicels 3-angled [119. *Ischaemum*](#)
- Racemes solitary; upper glume of sessile spikelets awned; awn of upper lemma ciliate along the coils; internodes of rhachis and pedicels linear, flat [120. *Sehima*](#)
- 21 Spikelets of each pair alike in shape and sex [121. *Microstegium*](#)
- Spikelets of each pair conspicuously different: 22
- 22 Callus of sessile spikelets obtuse, usually very short; awn glabrous or scaberulous: 23
- Callus of sessile spikelets acute to pungent, 1–5 mm. long; awn puberulous to hirsute; racemes paired [125. *Diheteropogon*](#)
- 23 Racemes solitary; lower glume of sessile spikelet convex on the back, the keels lateral or frontal with several intercarinal nerves; internodes of the rhachis and pedicels clavate to linear, the apex deeply hollowed into a cup with a fimbriate rim [122. *Schizachyrium*](#)
- Racemes paired or digitate, rarely solitary and then with the lower glume of the sessile spikelet concave and nerveless between the keels: 24
- 24 Racemes deflexed at maturity, borne upon subequal flattened raceme-bases, seldom exceeding the spatheole in length; internodes of the rhachis and pedicels linear; leaves aromatic; panicle dense, decompound [123. *Cymbopogon*](#)
- Racemes not deflexed, borne upon unequal, more or less terete, raceme-bases; leaves not aromatic [124. *Andropogon*](#)
- 25 Pedicelled spikelet without an appreciable callus; upper glume of sessile spikelet usually awnless; fertile lemma usually minutely bidentate, its awn pubescent to hirtellous; racemes paired: 26
- Pedicelled spikelet prolonged at the base into a callus 0.5–3 mm. long; upper glume of sessile spikelet nearly always awned; fertile lemma usually bifid for 1/4–1/2 its length, its awn shortly pubescent to glabrescent: . 28
- 26 Lower glume of sessile spikelet rounded on the back, or rarely with 2 shallow striations; upper glume obtuse to acute or mucronate [126. *Hyparrhenia*](#)
- Lower glume of sessile spikelet with a median longitudinal groove: 27

- 27 Raceme-bases produced at the tip into a long scarious appendage; racemes 2-awned per pair; upper glume acute to apiculate [127. *Hyperthelia*](#)
- Raceme-bases without distinct appendages; racemes 9–14-awned per pair; upper glume muticous or shortly awned [128. *Parahyparrhenia*](#)
- 28 Racemes paired (except *E. gossweileri*), with 1–10 homogamous pairs at the base, exserted from the narrow spatheole [129. *Elymandra*](#)
- Racemes solitary, without homogamous pairs: 29
- 29 Spatheoles cymbiform, coloured and enclosing the racemes; racemes dense with numerous spikelets concealing the short internodes; pedicelled spikelets broadly lanceolate, subacute, hairy or merely spinose-ciliate on the margins; callus of sessile spikelets obtuse [130. *Monocymbium*](#)
- Spatheoles linear to narrowly lanceolate, usually greenish, embracing the racemes or not; racemes loose, with few spikelets and long internodes visible between them; pedicelled spikelets linear-lanceolate, acuminate, nearly always glabrous; callus of sessile spikelets usually acute to pungent [131. *Anadelphia*](#)
- 30 Lower glume produced into a long flattened tail; spikelets similar [132. *Vossia*](#)
- Lower glume without a herbaceous tail: 31
- 31 Pedicelled spikelets long-awned from the lower glume (rarely awnless in *U. giganteum*); lower glume of sessile spikelet entire; callus short, rounded, at most pubescent (if top of internode ciliate from bearded callus see *Loxodera*) [133. *Urelytrum*](#)
- Pedicelled spikelets awnless, or sometimes awned but then the lower glume of the sessile spikelets bifid or aristulate at the tip: 32
- 32 Racemes numerous on a short common axis [134. *Jardinea*](#)
- Racemes solitary: 33
- 33 Racemes more or less villous: 34
- Racemes glabrous: 36
- 34 Articulation of the rhachis transverse, the callus very short; lower glume smooth, hirsute; lower floret male with a well-developed palea [135. *Lasiurus*](#)
- Articulation of the rhachis oblique, the callus up to 2 mm. long; spikelets paired: 35
- 35 Lower glume of the sessile spikelet without ridges, bimucronate or biaristate at the tip, hirsute or with a ciliate fringe; lower floret reduced to a barren lemma [136. *Elionurus*](#)
- Lower glume of the sessile spikelet longitudinally ridged, entire at the tip, spinulose on the nerves but otherwise glabrous; top of internode fringed with hairs from the bearded callus; lower floret male with a palea [137. *Loxodera*](#)
- 36 Sessile spikelet globose, the lower glume muricate [138. *Hackelochloa*](#)
- Sessile spikelet not globose: 37
- 37 Spikelets solitary, the pedicelled and its pedicel completely suppressed [139. *Oxyrhachis*](#)
- Spikelets paired, or at least the pedicel present; articulation of the rhachis transverse, or the raceme tough: ... 38
- 38 Pedicels wholly or partially fused to the internodes of the rhachis: 39
- Pedicels quite free from the internodes of the rhachis; racemes fragile: 41
- 39 Raceme tough, its flattened rhachis formed from the fused pedicels and internodes; spikelets almost alike; callus oblique [140. *Hemarthria*](#)
- Raceme fragile; pedicelled and sessile spikelets different: 40
- 40 Spikelets sunken in a cylindrical segment formed from the fused pedicel and internode; callus circular with a knob-like projection from its centre [141. *Rottboellia*](#)
- Spikelets not sunken, the flattened or triquetrous pedicel and internode usually fused only in the lower half, the keeled upper glume of the sessile spikelet thrust between them above; callus elliptic with a low central ridge [142. *Robynsiachloa*](#)
- 41 Racemes borne in spatheate panicles; lower glume of the sessile spikelet winged; spikelets awnless: 42
- Racemes long-exserted, terminal, the culms usually simple but sometimes with a few side branches; internode and pedicel appressed to approximate; pedicelled spikelet usually reduced [145. *Rhytachne*](#)
- 42 Sessile spikelets 6–7 mm. long; internode and pedicel gaping, the lower glume of the sessile spikelet thrust between; panicle scanty [143. *Chasmopodium*](#)
- Sessile spikelets small (3–4 mm. long in our species), imbricate; internode and pedicel approximate; racemes fasciculate [144. *Coelorhachis*](#)

Tribe 27—MAYDEAE

- 1 Male spikelets in large terminal panicles; female spikelets in axillary sheathed “ears” [146. *Zea*](#)

Male spikelets in a short raceme projecting from an ovoid ivory-like sheath containing a solitary female spikelet [147. Coix](#)

1. ARUNDINARIA

Michx., Fl. Bor. Am. 1: 73 (1803). *APD acc*

- 1 Leaf-blades lanceolate, 6–10 cm. long and 0.5–1 cm. broad, narrowed at the base into a very short false petiole, long-attenuate at the apex to a flexuous filiform tip; leaf-sheath glabrous, with small deciduous auricles bearing long setae; culm sheath without auricles, the blade linear-lanceolate, 1.5–7 cm. long; spikelets 2–4 cm. long, in a panicle; glumes 2; florets usually 5–10, distant, the rhachilla visible; lodicules 3; stigmas 2, rarely 3 .. [alpina](#)

Arundinaria alpina *K. Schum.* in Engl., Pflanzenw. Ost-Afr. C: 116 (1895); Camus, Bambus. 48; Hubbard in Hook., Ic. Pl. 6: t. 3594.

APD: Synonym of Sinarundinaria alpina (K. Schum.) C. S. Chao & Renvoize

Culms up to about 6 m. high and 3–5 cm. diam., hollow, with thick walls; flowers infrequently; occurs in gregarious patches.

W. Cam.: Johnstone! Mba Kokeka, Bamenda, 7,500 ft. Richards 5332! Keay FHI 28400! Brunt 795!

Also in the highland regions of eastern Africa.

2. BAMBUSA

Retz. corr. Schreb., Gen. Plant. 236 (1789), nom. cons. *APD acc*

- 1 Leaf-blades oblong-lanceolate, mostly 10–25 cm. long and 1–4 cm. broad, broadly rounded at the base and abruptly narrowed to a short false petiole, acuminate to a pungent tip; shoulders of leaf-sheath usually produced into tiny auricles, glabrous or with a few very short bristles; culm sheath bearing auricles up to 1 cm. long, the blade broadly ovate, 3–5 cm. long; spikelets 1–2 cm. long, in clusters of 1–10 or more along the branches of a spreading panicle; florets 4–12, distichous, laterally compressed; lemmas merging into glumes below, the lowermost of which bear spikelet buds in their axils; style 1, divided at the apex into 2–3 stigmas; lodicules 3 [vulgaris](#)

Bambusa vulgaris *Schrad. ex Wendel.* Collect. Pl. 2: 26, t. 47 (1810); Munro in Trans. Linn. Soc. 26: 106; Camus, Bambus. 122; Chev. Bot. 752, and in Rev. Bot. Appliq. 14: 136. *APD acc*

Culms up to about 13 m. high and 10 cm. diam., hollow; flowers infrequently; [moist soils near streams](#).

S. L.: Njala Deighton 5517! Loma Mts. Jaeger 8951! **Lib.:** Johnston! Monrovia Baldwin 13074! Nyaake, Webó Baldwin 6083! **iv. C.:** Kéeta. Cavally Basin Chev. 19354! **U. Onochie FHI 8215! Although poorly represented by herbarium specimens, this bamboo appears to have become naturalized throughout the forest zone of West Africa. An Asiatic species, introduced into most tropical countries.

3. OXYTENANTHERA

Munro in Trans. Linn. Soc. 26: 126 (1868).

- 1 Leaf-blades oblong-lanceolate, mostly 8–20 cm. long and 1–3 cm. broad, rounded at the base and contracted to a short false petiole, acuminate to a pungent tip; shoulders of leaf-sheath bearing setae 2–5 mm. long, without auricles; culm sheath without auricles, the blade linear and 1–3 cm. long; spikelets 15–40 mm. long, narrowly lanceolate, acuminate, in globose clusters 5–6 cm. diam., which are sometimes aggregated into an interrupted false spike; fertile florets 1–2, the lemmas sharply mucronate, convolute, merging into glumes below, the lowest of these with spikelet buds in their axils; stigmas 3; lodicules absent [abyssinica](#)

Oxytenanthera abyssinica (*A. Rich.*) *Munro* in Trans. Linn. Soc. 26: 127 (1868); Camus, Bambus. 144; Chev. Bot. 752, and in Rev. Bot. Appliq. 14: 136; Berhaut, Fl. Sén. ed. 2, 388.

Bambusa abyssinica A. Rich., Tent. Fl. Abyss. 2: 439 (1851).

Culms up to about 6 m. high and 5 cm. diam.; stems thick-walled, almost solid; **in savanna**.

4. *Guaduella macrostachys* (K. Schum.) Pilger in Mildbraed, Wiss. Ergebn. Deutsch. Zentr.-Afr.-Exped. 1910–11, 2: 93 (1922). *APD acc*

Microbambus macrostachus K. Schum. in Engl., Bot. Jahrb. 24: 336, t. 4 (1897).

Guaduella zenkeri Pilger in End., Bot. Jahrb. 30: 123 (1902).

Rhizomatous perennial 30–60 cm. high: **in forest shade**.

Ghana: Obepehia forest (Oct.) Ankrah SLUS 305! Subiri F.R., Tarkwa (Sept.) Andoh FH 5564! Ankasa F.R. (June) Hall GC 35523! **S. Nig.:** Oban Talbot 957! **W. Cam.:** Barombi Preuss.

Also in **E. Cameroun**.

5. PUELIA

Franch. in Bull. Soc. Linn. Paris 1: 674 (1887); Clayton in Hook., Ic. Pl. 37: t. 3642 (1967).

- 1 Spikelets pedicelled in a lax panicle 9–15 cm. long; leaf-sheaths glabrous *1. olyrifformis*
 Spikelets subsessile in a dense 1-sided panicle 1.5–3.5 cm. long; leaf-sheaths puberulous *2. ciliata*

1. *Puelia olyrifformis* (*Franch.*) *W. D. Clayton* in Kew Bull. 20: 271 (1966). *APD acc*

Atractocarpa olyrifformis *Franch.* in Bull. Soc. Linn. Paris 1: 675 (1887).

Perennial, about 60 cm. high.

S. L.: York Pass (Feb., Sept.–Dec.) Melville 481b! I Deighton 3319! Morton SL 3365! Morton & Gledhill SL 786! **Lib.:** Vahun (Nov.) Baldwin 10217!

Also in **the Congos** and **Tanzania**.

2. *Puelia ciliata* *Franch.* in Bull. Soc. Linn. Paris 1: 674 (1887). *APD acc*

APD: *Synonym of Guaduella oblonga Hutch. ex Clayton*

Puelia acuminata *Pilger* in Engl., Bot. Jahrb. 30: 125 (1901); F.W.T.A., ed. 1, 2: 503.

Puelia subsessilis *Pilger* l.c. 124 (1901).

W. Cam.: Barombi (Apr.) Preuss 277. Also to E. Cameroun, Gabon and Middle Congo.

6. OLYRA

Linn., Syst. Nat. ed. 10: 1261 (1759).

- 1 Erect or scandent perennial; leaf-sheaths closely nerved, joined to the blade by a short false petiole; blades ovate-elliptic or ovate-oblong, tailed-acuminate, asymmetrically rounded at the base, 10–20 cm. long, 3–6 cm. broad, with about 8 primary nerves on each side of the midrib and fainter ones between, and with fairly distinct transverse nerves; panicle narrow to sub-pyramidal, the branches with female spikelets above and male below; male spikelets on filiform pedicels; glumes rudimentary; lemma lanceolate, 4 mm. long, awned; female spikelets on clavate pedicels, ovoid, long-awned from the lower 7–9-nerved glume; grain tightly enclosed by the hardened shining white lemma *latifolia*

Olyra latifolia *Linn.* Syst. Nat. ed. 10: 1261 (1759); Chev. Bot. 737, and in Rev. Bot. Appliq. 14: 135; Berhaut, Fl. Sén. ed. 2, 410, 412. *APD acc*

Olyra brevifolia *Schumach.* (1827)—Chev. Bot. 737.

Olyra guineensis *Steud.* (1854).

A tall cane-like grass up to 3 m. high; fascicles of lateral shoots bearing very small leaves occasionally occur; **in forests and forest margins**.

Throughout tropical Africa and tropical America. (See Useful Plants.)

7. LEPTASPIIS

R. Br., Prod. 211 (1810).

- 1 Perennial; culms ascending, rooting at the lower nodes; leaf-sheaths closely nerved, joined to the blade by a false petiole about 1 cm. long; blade oblong or oblong-ob lanceolate, abruptly narrowed at tip, asymmetrically subacute at base, 10–25 cm. long, 2.5–3 cm. broad, subpinnately nerved with about 4 pairs of principal lateral nerves, and distinct transverse nerves; panicle terminal, branches 2–3 in a whorl, bearing short side branches with 1 male and 1 female spikelet, the male above; male spikelets 1-flowered, the lemma 4 mm. long, the glumes half as long; stamens 6; female spikelets 1-flowered, 6 mm. long; lemma inflated conchiform, closed except for a small hole near the apex, covered in hooked hairs *cochleata*

Leptaspis cochleata *Thwaites* Enum. Pl. Zeyl. 357 (1864).

APD: *Synonym of Leptaspis zeylanica* Nees ex Steud.

Leptaspis conchifera Hack. (1887)—A. Chev. in Rev. Bot. Appliq. 14: 135.

Up to 1 m. high; the false petiole is twisted bringing the abaxial leaf surface uppermost; **forest undergrowth**.

Tropical Africa generally, and in **Madagascar**, **Ceylon**, **Malaysia** and the **Solomon Is.**

8. STREPTOGYNA

P. Beauv., Ess. Agrost. 80, t. 16, fig. 8 (1812).

- 1 Leaf-blades narrowly lanceolate, tessellately nerved, 15–40 cm. long and 10–36 mm. broad, acuminate at the tip, narrowed at the base into a short false petiole; spikelets linear, 22–30 mm. long, thinly coriaceous, dark green or brownish, borne upon very short pedicels in a narrow erect raceme 11–30 cm. long; lemmas 5–7, awned, the lower fertile and appressed-pubescent below, the upper sterile; stigmas 2, retrorsely spinulose, 1–2 cm. long, long-exserted and tangled; lodicules 3 *crinita*

Streptogyna crinita *P. Beauv.* Ess. Agrost. 80, t. 16, fig. 8 (1812); C. E. Hubbard in Hook., Ic. Pl. 36: t. 3572 (1956) Chev. Bot. 751; Berhaut, Fl. Sén. ed. 2, 392. *APD acc*

Streptogyna gerontogaea *Hook. f.* in Trimen, Fl. Ceyl. 5: 301 (1900); F.W.T.A. ed. 1, 2: 505; A. Chev. in Rev. Bot. Appliq. 14: 122.

A broad-leaved perennial of **forest shade**, 0.3–1.7 in. high spreading by scaly rhizomes. The rhachilla segment adjacent to the base of each lemma forms a trap for catching hairs and thus effecting dispersal.

Sen.: Forêt de Boudié, Casamance (Nov.) Berhaut 6385! **Port. G.:** Cadique (Jan.) Pereira & Correia 2621! Bedanda, Cantanhex (Jan., May) Pereira & Correia 2798! Pereira 1896! Catio (Jan.) Extends south to the Congo, and east to **Uganda** and the **Sudan**; also in **S. India** and **Ceylon**. (See Useful Plants.)

[The name *S. crinita* has been commonly misapplied to the American species *S. americana* C. E. Hubbard.]

9. ORYZA

Linn., Sp. Pl. ed. 1, 333 (1753), and Gen. Pl. ed. 5, 155 (1754); Tateoka in Bot. Mag. Tokyo 76: 165 (1963).

- 1 Ligule of the lower leaves very long, 15–45 mm., acute:2
Ligule of the lower leaves short, rarely over 6 mm. long, rounded or truncate at tip:3
- 2 Annual; spikelets persistent, usually awnless; cultivated rice [1. sativa](#)
Rhizomatous perennial; spikelets deciduous, awned; wild [2. longistaminata](#)
- 3 Spikelets broadly linear, 1–1.5 mm. broad and 6–8 mm. long; sterile lemmas subulate; awns 6–17 cm. long ...[3. brachyantha](#)
Spikelets oblong or oblong-elliptic; sterile lemmas flat, membranous, linear:4
- 4 Spikelets 4.5–6 mm. long, hispid, awned:5
Spikelets over 7 mm. long (shorter in some forms of *O. glaberrima* but then the spikelets glabrous):6
- 5 Panicle contracted with ascending branches; ligule less than 3.5 mm. long; spikelets narrowly elliptic, less than 2 mm. broad, the length about 3 times the breadth[4. eichingeri](#)
Panicle loose with spreading branches; ligule 3–10 mm. long; spikelets elliptic, more than 2 mm. broad, the length about 2.5 times the breadth[5. punctata](#)
- 6 Fertile lemma and palea hispid; spikelets deciduous, awned; awns hispidulous; wild[6. barthii](#)
Fertile lemma and palea glabrous or sometimes hispid; spikelets persistent, usually awnless; awns, when present, smooth or at most scaberrulous; cultivated rice[7. glaberrima](#)

1. **Oryza sativa** *Linn.* Sp. Pl. 333 (1753); Chev. Bot. 739; Berhaut, Fl. Sén. ed. 2, 416; Portères in J. Agric. Trop. 3: 341, 541, 627. **APD acc**

Widely cultivated on river flood-plains in W. Africa, and in a few localities grown as an upland crop. Throughout the tropics, extending into warm-temperate regions. (See Useful Plants.)

Many cultivars; Portères, l.c. discusses infra-specific taxa in detail, with keys and synonymy.

2. **Oryza longistaminata** *A. Chev. & Roehr.* in Compt. Rend. Acad. Sci. 159: 561 (1914); Chev. Bot. 739. **APD acc**

Oryza barthii of F.W.T.A. ed. 1, 2: 537, not of A. Chev; Berhaut, Fl. Sén. ed. 2, 416; Tateoka in Bot. Mag. Tokyo 75: 455; (see Clayton in Kew Bull. 21: 488).

Oryza silvestris *Stapf ex A. Chev.* (1911), name only.

Oryza silvestris var **punctata** f. **longiligulata** *A. Chev.*, Et. Fl. Afr Centr. Fr. 1: 369 (1913), name only.

Oryza dewildemanii *Vanderyst* (1920), in syn.

Swamps, riversides and as a weed in rice fields.

An indigenous **cultivated rice, grown on flood-plains** from Senegal to L. Chad. (See Useful Plants.)

Many cultivars; Portères (l.c.) gives a key to varieties and forms, and discusses synonymy.

10. LEERSIA

Soland. ex Sw., Prod. Veg. Ind. Occ. 21 (1788), nom. cons.; Launert in Senck. Biol. 46: 129 (1965).

- 1 Lemma with an awn about 5 mm. long; spikelets 4–6 mm. long, up to 1 mm. broad [1. *tisserantii*](#)
 Lemma awnless: [2](#)
- 2 Spikelets glabrous or puberulous, 1.7–2 mm. long; stamens 3; culms slender, trailing [2. *triandra*](#)
 Spikelets more or less pubescent on the sides, and prominently ciliate on the keel with curving glassy hairs;
 stamens 6: [3](#)
- 3 Hairs on lemma and palea curved almost to a semicircle; spikelets 2–2.5 mm. long; panicle open, the branches
 spreading; culms erect [3. *drepanothrix*](#)
 Hairs on lemma and palea more or less straight, the keels pectinate-ciliate; spikelets 3.5–4 mm. long; panicle
 narrow, the branches ascending; culms weak, usually long decumbent [4. *hexandra*](#)

1. **Leersia tisserantii** (*A. Chev.*) *Launert* in Senck. Biol. 46: 137 (1965). *APD acc*

Oryza tisserantii *A. Chev.* in Rev. Bot. Appliq. 12: 1024 (1932); Jacques-Félix in J. Agric. Trop. 6: 582.

Slender grass **growing in streams**.

Guin.: Fouta Djallon Jac.-Fél. 7419.

Also in **C. African Rep., Congo, Kenya** and **Zambia**.

2. **Leersia triandra** *C. E. Hubbard* in Kew Bull. 1936: 313. *APD acc*

A straggling grass **of marshy places**.

S. L.: Hangha (Sept.) Deighton 4031! Konta (Aug.) Deighton 1241! **Lib.:** Karmahun, Kolahun Dist. (Nov.) Baldwin 10227! Dubo, Sanokwele Dist. (Sept.) Baldwin 9485!

3. **Leersia drepanothrix** *Stapf* in Journ. de Bot. 19: 107 (1905); A. Chev. in Rev. Bot. Appliq. 14: 134; Berhaut, Fl. Sén. ed. 2, 406. *APD acc*

Up to 1 m, high, erect from a short rhizome; **marshy places**.

Throughout the tropics.

Lachnochloa pilosa Steud. Syn. Pl. Glum. 1: 5 (1854).

Senegambia.

Although included in Oryzeae by Steudel, the description will fit no West African grass. The type, which cannot now be found, was incomplete and has obviously been misinterpreted.

11. FESTUCA

Linn., Sp. Pl. 73 (1753), and Gen. Pl. ed. 5, 33 (1754); St.-Yves in Candollea 4: 65 (1929).

- 1 Awns up to 3 (rarely 5) mm. long; leaf-blades narrowly linear, convolute; panicle narrow and subspiciform, dense, usually 10–15 cm. long, the branches scabrid; spikelets 6.5–12 mm. long; glumes broad with hyaline margins, 5.5–10 mm. long, about 3/4 the length of the spikelet, the lower often 3-nerved; lemmas 6.5–9.5 mm. long, with a terminal awn-point [1. abyssinica](#)
- Awns 8–15 mm. long: **2**
- 2 Leaf-blades 1–2 mm. wide; lemmas smooth; awn terminal; ovary hairy on top [2b. camusiana subsp. chodatiana](#)
- Leaf-blades 7–17 mm. wide; lemmas scabrid; awn subterminal; ovary glabrous [3. mekiste](#)

1. Festuca abyssinica Hochst. ex A. Rich. Tent. Fl. Abyss. 2: 432 (1851); St.-Yves l.c. 80; Hedberg in Sym. Bot. Uppsal. 15: 37 (1957). *APD acc*

Festuca schimperana A. Rich. l.c. 433 (1851); F.W.T.A. ed. 1, 2: 508.
Festuca rigidula Steud., Syn. Pl. Glum. 1: 314 (1854).
Festuca gelida Chiov. in Ann. Bot., Roma 6: 147 (1907).
Koeleria afromontana Jac.-Fél., Gram. Afr. Trop. 186 (1962), name only.

Densely caespitose perennial, 15–60 cm. high.

W. Cam.: Cam. Mt., 10,000–13,300 ft. (Dec., Jan.) Mann 1349! Mildbr. 10909! Boughey GC 12627! Hinds C13! Maitland 1247! **F. Po:** Clarence Peak, 8,500 ft. (Mar.) Mann 656! 1465! 1477!

On mountain peaks throughout tropical Africa.

2a. Festuca camusiana St.-Yves in Bull. Soc. Bot. Genève, sér. 2, 18: 156 (1926). *APD acc*

2b. Festuca camusiana subsp. chodatiana St. Yves l.c. 158 (1926). *APD acc*

Festuca simensis of F.W.T.A. ed. 1, 2: 508, not of Hochst. ex A. Rich. (1851).

Loosely tufted perennial 60–90 cm. high.

W. Cam.: Cam. Mt., 7,000 ft. (Apr., Dec.) Mann 2069! Boughey 6383 ! 6775! Above Bafut-Ngemba F.R., 7,050 ft. (July) Brunt 775! **F. Po:** 8,500 ft. (Mar.) Mann 1473!

Also on mountain peaks in Kenya, Uganda, Tanzania, southern Sudan and eastern Congo.

Dimensions of spikelets and their parts are slightly smaller in E. Africa.

3. *Festuca mekiste* *W. D. Clayton* in *Kew Bull.* 23: 293 (1969). *APD acc*

Festuca gigantea of F.W.T.A. ed. 1, 2: 508, not of (Linn.) Vill.

Perennial 0.6–2 m. high.

W. Cam.: Cam Mt., 7,000–7,600 ft. (Dec.) Mann 2078! Maitland 1338! 1338a! 8,000 ft. (Feb.) Maitland 1038! Ukele, 8,000 ft. (Feb.) Maitland 1336! **F. Po:** 8,500 ft. (Mar.) Mann 1462! 1468!

Also in **Kenya**. (See Useful Plants.)

12. VULPIA

Gmel., *Fl. Bad.* 1: 8 (1806).

- 1 Leaf-sheaths glabrous; blades linear, 1–2 mm. broad; panicle erect and narrow, more or less secund 2.5–7 cm. long; spikelets 7–14 mm. long without the awns, 5–10-flowered; glumes subulate-lanceolate, the lower 1-nerved and 1/2–3/4 as long as the spikelet, the upper 3-nerved; lemmas 5–9 mm. long, linear-lanceolate, faintly 5-nerved, narrowed into a slender awn up to 13 mm. long [bromoides](#)

Vulpia bromoides (Linn.) S. F. Gray *Nat. Arr. Brit. Pl.* 2: 124 (1821).

APD: Synonym of Vulpia myuros subsp. sciuiroides (Roth) Rouy

Festuca bromoides Linn., *Sp. Pl.* 75 (1753).

A very slender annual, up to about 23 cm. high in our area.

W. Cam.: Cam. Mt., 7,000–10,000 ft. (Dec.) Mann 2091! Boughey GC 12537!

A species from Europe and the Mediterranean, extending to mountain peaks in tropical Africa; introduced elsewhere.

13. POA

Linn., *Sp. Pl.* 67 (1753), and *Gen. Pl.* ed. 5, 31 (1754).

- 1 Panicle contracted, almost linear, the spikelets densely clustered [1. leptoclada](#)
Panicle open, with spreading branches: **2**
- 2 Annual; lemmas obtuse [2. annua](#)
Perennial; lemmas acute [3. schimperana](#)

1. *Poa leptoclada* *Hochst. ex A. Rich.* *Tent. Fl. Abyss.* 2: 422 (1851.); Hedberg in *Sym. Bot. Uppsal.* 15: 39 (1957). *APD acc*

Strangling or tufted perennial 15–60 cm. high.

W. Cam.: Cam. Mt., 6,000–12,000 ft. (Dec.–Feb.) Mann 2071! Dalz. 8351! Maitland 1273! Hinds C83! Morton GC 6901!
F. Po: 7,500 ft. (Apr.) Mann 1480!

Mountain peaks throughout tropical Africa.

2. *Poa annua* *Linn.* *Sp. Pl.* 68 (1753). *APD acc*

Loosely tufted annual up to about 15 cm. high.

W. Cam.: Buea, 3,000 ft. (Apr., Dec.) Brenan & E. W. Jones 9583! Hinds C5! Cam. Mt., 5,600–7,500 ft. (Nov.–Jan.) Maitland 1262! Hinds C57! Migeod 218! **F. Po:** Moka, 4,000 ft. (Dec.) Boughey 58!

A very common weed of temperate regions, extending to highland areas in the tropics.

3. *Poa schimperana* *Hochst. ex A. Rich.* *Tent. Fl. Abyss.* 2: 423 (1851); Hedberg in *Sym. Bot. Upsal.* 15:

41 (1957). *APD acc*

Poa binata of F.W.T.A., ed. 1, 2: 509, not of Nees.

Tufted perennial about 60 cm. high; [mountain peaks](#).

N. Nig.: Chappal Waddi (Nov.) Jackson, Magaji & Tuley 2036! **W. Cam.:** Cam. Mt., 9,000 ft. (Nov., Dec.) Migeod 173! Mann 2083! Above Bamenda, 7,500 ft. (July) Brunt 781b!

Mountain peaks in tropical Africa.

14. BROMUS

Linn., *Sp. Pl.* 76 (1753), and *Gen. Pl.* ed. 5: 33 (1754).

- 1 Leaf-blades flat, 5–10 mm. broad, usually with falcate auricles at the base; leaf-sheaths laxly pilose with deflexed hairs, retrorsely scabrid on the nerves; panicle very lax with slender branches; spikelets 1.5–3 cm. long without the awns, laterally compressed; lower glume 3–6 mm. long, 1-nerved, the upper 5–12 mm. long, 3-nerved; lemmas 7–14 mm. long, pubescent on the nerves, glabrous or appressed-pubescent between, with an awn 2–12 mm. long inserted just below the obtuse tip; palea finely ciliate on the keels[leptoclados](#)

Bromus leptoclados *Nees* *Fl. Afr. Austr.* 453 (1841). *APD acc*

Bromus cognatus *Steud.*, *Syn. Pl. Glum.* 1: 321 (1854).

Bromus scabridus *Hook. f.* in *J. Linn. Soc.* 7: 231 (1864); F.W.T.A., ed. 1, 2: 508.

A handsome perennial up to 2 m. high; [on highlands](#).

W. Cam.: Cam. Mt., 9,000 ft. (Nov.–Mar.) Mann 2085! Dalz. 8352! Migeod 175! Maitland 1261! Hinds C47!

[On highlands](#) throughout tropical and S. Africa.

May be confused, with *Festuca mekiste*, in which the lemma and keels of the palea are merely scabrid.

15. BRACHYPODIUM

P. Beauv., *Ess. Agrost.* 100 (1812).

- 1 Leaf-sheaths nearly always scabrid; racemes 6–12 cm. long, usually with 5–8 spikelets borne upon pedicels 1–2 mm. long; spikelets narrowly lanceolate, 1.5–3 cm. long, 6–12-flowered; glumes subequal, 4–10 mm. long; lemmas 7–11 mm. long, 7-nerved, tipped with a straight awn 4–8 mm. long[flexum](#)

Brachypodium flexum *Nees* *Fl. Afr. Austr.* 1: 456 (1841). *APD acc*

Weak-stemmed perennial 30–90 cm. high.

S. L.: Tingi Hills (May) Gledhill 222! **N. Nig.:** Chappal Waddi, Sardauna Prov. (Nov.) Jackson, Magaji & Tuley 2035! **F. Po:** Clarence Peak, 7,000 ft. Mann 321!

Also in [Sudan](#) and [Ethiopia](#) to [South Africa](#) and [Madagascar](#).

[*B. flexum* is very closely related to the European *B. sylvaticum* (Huds.) *P. Beauv.*, which has smooth leaf-sheaths. The Sierra Leone specimen cited above has smooth sheaths, the Nigerian scabrid, and the one from F. Po is very poorly preserved and smothered in glue. The identity of the West African plants must remain uncertain pending further study based on better material.—W.D.C.]

16. TRITICUM

Linn., *Sp. Pl.* 85 (1753), and *Gen. Pl.* ed. 5, 37 (1754).

- 1 Spikelets 10–15 mm. long and 9–18 mm. across the face, 5–9-flowered, imbricate in a dense spike which is square in section or more commonly broadest across the face of the spikelets; glumes oblong, shorter than the spikelet, keeled above, the central nerve prolonged into a tooth or short awn; lemmas glabrous or pubescent, awned or awnless[aestivum](#)

Triticum aestivum *Linn. Sp. Pl. 85 (1753). APD acc*

Triticum vulgare *Vill.*, Hist. Pl. Dauph. 2: 153 (1787); F.W.T.A., ed. 1, 2: 509; De Miré & Gillet in J. Agric. Trop. 3: 740 (1956).
Triticum sativum *Lam.* (1778).

Mali: Bamako (Jan.) Chev. 217! **N. Nig.:** Katsina Rae! Thornton! Kari Foster 21! Kalkala (Aug.) Gwynn! Bornu Thornton!

The common bread wheat of temperate regions.

17. HORDEUM

Linn., Sp. Pl. 84 (1753), and Gen. Pl. ed. 5, 37 (1754).

- 1 Spikelets of each triad alike and fertile, sessile, arranged in six rows along the spike; glumes very narrow, about 1 cm. long, side by side in front of the floret; lemma as long as the glumes, prolonged in a straight, stiff, scabrid bristle 5–10 cm. long [vulgare](#)

Hordeum vulgare *Linn. Sp. Pl. 84 (1753); Chev. Bot. 752. APD acc*

N. Nig.: Bornu Thornton! Mongonu Dept. of Agric.! Mobber Dept. of Agric.!

The common barley of temperate regions.

18. STREBLOCHAETE

Hochst. ex Pilger in Engl., Bot. Jahrb. 37, Beibl. 85: 81 (1906); F.T.A. 10: 101; Tateoka in Bot. Mag. Tokyo 78: 289 (1965).

- 1 Leaf-blades narrowly lanceolate-linear, up to 1 cm. broad; leaf-sheath entire, the margins united; panicle slender, narrow; spikelets narrowly lanceolate, 16–28 mm. long, loosely 2–6-flowered; glumes membranous with hyaline margins, the upper up to 12 mm. long; lemmas up to 15 mm. long, 7-nerved, entire or shortly bilobed with the lobes up to 2 mm. long, awned from the back just below the sinus of the lobes; awn flexuous, up to 4 cm. long [longiarista](#)

Streblochaete longiarista (*A. Rich.*) *Pilger* in Notizbl. Bot. Gart. Berl. 9: 516 (1926); F.T.A. 10: 102. *APD acc*

Trisetum longiaristum *A. Rich.*, Tent. Fl. Abyss. 2: 417 (1851).

A loosely tufted perennial up to 1 m. high; the awns become entangled so that the florets are detached from the inflorescence in bunches; **margins of montane forests**.

W. Cam.: Cam. Mt., 8,000 ft. (Dec.) Mann 2077! Jonjo, 7,600 ft. (Feb.) Maitland 1335! Mann's Spring, 7,000 ft. (Mar.) Brenan 9512! Summit Peak, S.E. Bamenda, 8,200 ft. (Dec.) Boughey GC 11031! Bambui, 7,400 ft. (Dec.) Boughey GC 10865! **F. Po.:** (Dec.) Boughey GC 10817!

Mountain peaks throughout Africa; also in **Réunion**, the **Malayan Islands** and the **Philippines**.

19. KOELERIA

Pers., Syn. Pl. 1: 97 (1805); Domin in Biblio. Bot. 14 (65) (1907); F.T.A. 10: 94 (1937).

- 1 Leaf-blades strongly nerved, convolute; panicles spiciform, dense, 4–9 cm. long, straw-coloured or purplish, the axis pubescent or tomentose; spikelets 3.5–7 mm. long, 1–3-flowered; glumes slightly shorter than the spikelet, the upper 1–3-nerved; lemma 3-nerved [capensis](#)

Koeleria capensis (*Steud.*) *Nees* in Linnaea 7: 321 (1832). *APD acc*

Aira capensis *Steud.* in Flora 12: 469 (1829).

Koeleria cristata var. **convoluta** (*Hochst. ex Steud.*) *C. E. Hubbard* in Kew Bull. 1936: 500; F.T.A. 10: 95.

Koeleria convoluta *Hochst. ex Steud.*, Syn. Pl. Glum. 1: 293 (1854); F.W.T.A., ed. 1, 2: 527; Domin in Biblio. Bot. 14 (65): 109.

Koeleria gracilis *Pers. var. convoluta* (*Hochst. ex Steud.*) *Hedberg* in Symb. Bot. Uppsal. 15: 42.

Tufted perennial, 23–45 cm. high.

W. Cam.: Cam. Mt., 10,000–12,000 ft. (Dec.–Apr.) Mann 1357! Maitland 1259! Boughey GC 12644! Keay FHI 28617! Thresh 6!

E. Cameroun and **Ethiopia to the Cape**.

20. AIRA

Linn., Sp. Pl. 63 (1753), and Gen. Pl. ed. 5: 31 (1754); F.T.A. 10: 87 (1937). *APD acc*

- 1 Panicle delicate, with spreading filiform branches; spikelets 2·7–3·2 mm. long (down to 2·2 mm. long in Europe); glumes acute, membranous, shining, enclosing 2 florets; lemma about 2 mm. long, glabrous, with a geniculate awn 3–4 mm. long arising from about the middle of the back; callus of the florets normally bearded with white hairs, but glabrous in our area [caryophyllea](#)

Aira caryophyllea *Linn.* Sp. Pl. 66 (1753); F.T.A. 10: 87. *APD acc*

Slender annual 5–30 cm. high.

N. Nig.: Chappal Waddi (Apr., Nov.) Jackson, Magaji & Tuley 2024! 2055! Gbile & Daramola FHI 63274! **W. Cam.:** Cam. Mt., 8,000–12,000 ft. (Dec.–Jan.) Mann 1356! Steele 60! Maitland 868! 1274! Mildbr. 10908!

Europe and western Asia, extending to tropical African mountains and to South Africa; introduced into most other temperate regions.

[The glabrous callus is found in *A. cupaniana* Guss., but the size and shape of the glumes suggest that our species is host treated as a form of *A. caryophyllea*.]

Imperfectly known species.

Aira paradoxa *Steud.* Syn. Pl. Glum. 1; 223 (1854).

“Guinea” Lenormand.

The plant cannot be identified from the description.

21. HELICTOTRICHON

Bess. ex Roem. & Schult., Syst. Veg. 2, Addit. 52 (1827); F.T.A. 10: 103 (1937).

- 1 Lower glume 3·5–5 mm. long, up to half the length of the spikelet; spikelets 1·4–1·9 cm. long, arranged in a narrow panicle; florets 3–4, long exserted from the glumes; lemmas with a geniculate awn from the upper third of the back; leaf-blades up to 10 mm. broad [1. mannii](#)

Lower glume 5–12 mm. long, almost as long as the spikelet; spikelets 0·8–1·6 cm. long, arranged in a narrow panicle; florets 2–3; lemmas with a geniculate awn from about the middle of the back; leaf-blades up to about 5 mm. broad [2. elongatum](#)

1. **Helictotrichon mannii** (*Pilger*) *C. E. Hubbard* in Kew Bull. 1936: 334; F.T.A. 10: 110. *APD acc*

A. elongatum (*Hochst. ex A. Rich.*) *Pilger*, l.c. (1926), incl. var. *preussii* *Pilger*.

Arrhenatherum rigidulum (Pilger) Potztl in Engl., Bot. Jahrb. 75: 329 (1951).

Perennial up to 1.5 m. high.

N. Nig.: Chappal Waddi (Nov.) Jackson, Magaji & Tuley 2001! **W. Cam.:** Cam. Mt., 7,000–8,000 ft. (Dec.–Feb.) Mann 2068! Maitland 965! 1039! 1222! Bafut-Ngemba F.R., Bamenda (Mar.) Hepper 2243! Lakom, Bamenda (May) Maitland 9a! Kishong, Bamenda (Mar.) Brunt 1022!

Sudan and **Ethiopia** southwards to Rhodesia, and in **Madagascar**.

22. DESCHAMPSIA

P. Beauv., Ess. Agrost. 91 (1812); F.T.A. 10: 89 (1937).

- 1 Leaf-blades flat, up to about 5 mm. broad, scabrid upon the prominent ridges above; awns straight, not projecting beyond the glumes; spikelets 4–5 mm. long [1. caespitosa](#)
 Leaf-blades tightly rolled, up to 1 mm. diam.; awns slightly geniculate, projecting about 2 mm. beyond the glumes; spikelets 4–8 mm. long [2. mildbraedii](#)

1. *Deschampsia caespitosa* (Linn.) *P. Beauv.* Ess. Agrost. 91: 160 (1812), incl. var. *mannii* C. E. Hubbard in Kew Bull 1935: 311; F.T.A. 10: 91. **APD acc**

Aira caespitosa Linn., Sp. Pl. 64 (1753).

A harsh-leaved perennial up to 1 m high.

F. Po: Clarence Peak (Pico de S. Isabel), 9,000–10,000 ft. (Mar.) Mann 322! 1464! Guinea 2793!

Temperate regions of both hemispheres, and on the mountains of East Africa.

2. *Deschampsia mildbraedii* Pilger in Notizbl. Bot. Gart. Berl. 10: 769 (1929); F.T.A. 10: 92. **APD acc**

Caespitose perennial up to 1.2 m. high, with stiff rush-like leaves.

W. Cam.: Cam. Mt., 10,000–12,000 ft. (Dec.–Feb.) Maitland 1246! Hinds C31! Boughey GC 12661! Keay FHI 28616! Dalz. 8350!

23. AGROSTIS

Linn., Sp. Pl. 61 (1753), and Gen. Pl. ed. 5, 30 (1754); F.T.A. 10: 166 (1937). **APD acc**

- 1 Panicle loose, open, with flexuous filiform branches; spikelets 4–4.5 mm. long; lemmas pilose; awn basal, about 5 mm. long; palea about as long as the lemma [1. mannii](#)
 Panicle dense and spike-like; spikelets 3.5–4.5 mm. long; lemma glabrous or pubescent; awn basal, 3.5–5 mm. long; palea two thirds as long as the lemma [2. quinqueseta](#)

1. *Agrostis mannii* (Hook. f.) Stapf in Fl. Capensis 7: 549 (1899); F.T.A. 10: 184. **APD acc**

Deyeuxia mannii Hook. f. in J. Linn. Soc. 7: 228 (1864).

Calamagrostis mannii (Hook. f.) Engl. (1892).

Tufted perennial up to 1 m. high; the spikelets sometimes with a rachilla extension up to 3 mm. long.

W. Cam.: Cam. Mt., 6,700–12,000 ft. (Dec.–Apr.) Mann 2096! Maitland 1033! Hinds C87! Boughey GC 6956! Morton GC 6887! **F. Po:** Clarence Peak (Pico de S. Isabel), 8,500 ft. (Mar.–Dec.) Mann 1469! Boughey GC 10801! Guinea 2791! 2795!

Also in **E. Cameroun** and **Ethiopia**.

Very closely related to *A. kilimandscharica* Mez (1922) from East Africa.

2. *Agrostis quinqueseta* (Steud.) Hochst. in Flora 38: 285 (1855); F.T.A. 10: 182 (1937). **APD acc**

Anomalotis quinqueseta Steud., Syn. Pl. Glum. 1: 198 (1854).

Agrostis mildbraedii Pilger in Wiss. Ergebn. deutsch. Zentr.-Afr. Exped. 1907–1908, 2: 47 (1910); F.T.A. 10: 181.

Agrostis congesta C. E. Hubbard in Kew Bull. 1936: 301; F.T.A. 10: 182; F.W.T.A. ed. 1, 2: 530.

Perennial up to 1 m. high.

W. Cam.: Cam. Mt., 8,000–10,000 ft. (Dec.–Feb.) Mann 2086! Maitland 930! 1034!

Also in **E. Cameroun**, **Congo**, **Ethiopia**, **Uganda** and **Kenya**.

24. HYPSEOCHLOA

C. E. Hubbard in Kew Bull. 1936: 300; F.T.A. 10: 165 (1937).

- 1 Inflorescence a delicate panicle, 5–10 cm. long; spikelets cleistogamous, 3 mm. long; glumes equal, acutely acuminate, as long as the spikelet; lemma indurated, with a geniculate awn 4–6 mm. long from the middle of its back [cameroonensis](#)

Hypseochoa cameroonensis *C. E. Hubbard* l.c. (1936); F.T.A. 10: 165. *APD acc*

A delicate slender annual up to 45 cm. high; closely resembles *Aira caryophyllea*, with which it is often found mixed.

W. Cam.: Cam. Mt., 7,000–12,000 ft. (Dec.) Mildbr. 10881! Maitland 874! 960! 1228a! 1274a! Hinds C19a!

Polypogon monspeliensis (*Linn.*) *Desf.* Fl. Atlant. 1: 67 (1798). *APD acc*

Alopecurus monspeliensis *Linn.*, Sp. Pl. 61. (1753).

Differs from *Agrostis* in the long-awned glumes and dense panicle.

Recorded from the northern edge of our area at Aïr, **Niger Republic** by De Miré & Gillet in J. Agric. Trop. 3: 735 (1956).

A cosmopolitan species of warm-temperate regions.

Additional genus.

25. PHRAGMITES

Adans., Fam. PL 2: 34, 559 (1763); F.T.A. 10: 152 (1937); Clayton in Kew Bull. 21: 113 (1967).

- 1 Leaf-blades usually smooth beneath, with filiform flexuous tips; rhachilla hairs 5–11 mm. long, copious, silky; upper glume 5–9 mm. long, obtuse to tridenticulate [1b. australis subsp. altissimus](#)
 Leaf-blades usually scabrid beneath (at least in the upper half), with stiff attenuate tips; rhachilla hairs 5–7 mm. long, rather sparse; upper glume 4–7 mm. long, acute to subacute [2. karka](#)

1a. **Phragmites australis** (*Cav.*) *Trin. ex Steud.* Nom. Bot. ed. 2, 2: 324 (1841). *APD acc*

Arundo australis *Cav.* in Ann. Hist. Nat. 1: 100 (1799).

A. phragmites *Linn.* (1753).

A. vulgaris *Lam.* (1778), illeg. name.

Phragmites communis *Trin.*, Fund. Agrost. 134 (1820); F.T.A. 10: 153; Chev. Bot. 748; De Miré & Gillet in J. Agric. Trop. 3: 735.

Phragmites vulgaris *Crép.* (1866)—F.W.T.A., ed. 1, 2: 510, partly; Berhaut, Fl. Sén. ed. 2, 419

1b. **Phragmites australis subsp. altissimus** (*Benth.*) *W. D. Clayton* in Taxon 17: 158 (1988). *APD acc*

Arundo altissima *Benth.*, Cat. Pl. Pyr. 62 (1826).

A. maxima *Forsk.*, Fl. Aegypt. Arab. 24 (1792), name of doubtful application.

A. isiaca *Del.* (1813), illeg. name.

Phragmites communis subsp. maximus (*Forsk.*) *W. D. Clayton* in Kew Bull. 21: 116 (1967), doubtful name.

A rhizomatous perennial up to 3.5 m. or more high, with handsome plumose panicles; found near water. Subsp. *australis*, a cosmopolitan grass of temperate regions, is of smaller stature and has an acute to apiculate upper glume.

Sen.: Adanson! Richard! (Nov.) Chev. 33980! Senegal R. Brunner 15! **Gam.:** Karinikunda (Feb.) Frith 169! Massembe (July) Deighton 5601! **Niger:** Niamey (Jan.) Chev. 43197! Zinder (Feb.) Chev. 43664! **N. Nig.:** Chad (Oct.–Dec.) Elliot 159! Golding 36! Davey FHI 27114! Johnston N 17!

Shores of the Mediterranean, extending eastwards to Iran, [Arabia](#) and northern [Kenya](#).

2. *Phragmites karka* (Retz.) Trin. ex Steud. Nom. Bot. ed. 2, 2: 324 (1841). *APD acc*

Arundo karka Retz., Obs. Bot. 4: 21 (1786).

Phragmites laxiflorus Steud. (1854).

Phragmites mauritianus of F.T.A. 10: 155, partly.

Phragmites vulgaris of F.W.T.A., ed. 1, 2: 510, partly.

A rhizomatous perennial up to about 7 m. high, with large plumose panicles; [found near water](#).

Sen.: Roger! **Mali:** Kayes (Nov.) Jaeger 5667! **Port. G.:** Bissau (Feb.) Esp. Santo 1798! **S. L.:** Freetown (Dec.) Hagerup 762! **Ghana:** Kpong (June, Jan.) Ankrah GC 20054! Irvine 1918! Jones, Keay & Onochie FHI 14233! Mbiakpaba (Mar.) Jackson 514! Daramola FHI 46341!

Also in [E. Cameroun](#), [Uganda](#), [Ethiopia](#) and [Sudan](#), extending eastward? through India and Malesia to N. Australia.

Very closely related to *P. mauritianus* Kunth, which is distinguished by its broader acuminate subequal glumes.

Gynerium sagittatum* (Aubl.) P. Beauv. Ess. Agrost. 138 (1812). *APD acc

Saccharum sagittatum Aubl., Pl. Gui. 1: 50 (1775).

A huge plant up to 8 m. high; leaf-blades up to 7 cm. wide, spinulose on the margins; plants dioecious, the <Image p="fefemale"> panicle plumose, the <Image p="fefemale"> glabrous; spikelets 3·5–5·5 mm. long.

Ghana: Aburi (<Image p="fefemale">) Howes 1200! Yawkoko (<Image p="fefemale">) (Jan.) Morton GC 25335!

A species from [tropical America](#) introduced to Ghana.

Additional genus

26. ASTHENATHERUM

Nevski in Act. Univ. As. Med. sér. 8b, Bot. Fasc. 17: 8 (1934); Conert in Senck. Biol. 43: 239 (1962).

APD: Synonym of Centropodia (R. Br.) Rchb.

- 1** Panicle dense, embraced below by the broad uppermost leaf-sheath; glumes subequal, 7–9 mm. long, prominently 7–9-nerved, enclosing 2 or 3 florets; lemmas about 3 mm. long (entire part), 9-nerved, the lateral lobes 2 mm. long, acuminate, the awn straight or slightly geniculate[forskalii](#)

***Asthenatherum forskalii* (Vahl) Nevski** in Act. Univ. As. Med. sér. 8b, Bot. Fasc. 17: 8 (1934).

APD: Synonym of Centropodia forsskalii (Vahl) Cope

Avena forskalii Vahl, Symb. Bot. 2: 25 (1791).

Danthonia forskalii (Vahl) R. Br. in Denham & Clapperton, Narr. Trav. North & Centr. Afr., Append. 244 (1826); F.T.A. 10: 140; F.W.T.A., ed. 1, 2: 527; Chev. Bot. 744, and in Rev. Bot. Appliq. 14: 44; De Miré & Gillet in J. Agric. Trop. 3: 730.

Loosely tufted perennial with pungent glaucous leaves and coarse stringy roots; [a desert grass](#).

Maur.: Oualata Rossetti 61/161! Oualata to Nèma Jumelle 1!

N. Africa and **the Middle East**, extending southward to [Sudan](#) and N. [Kenya](#); also in [Angola](#).

27. PENTASCHISTIS

Stapf in Fl. Capensis 7: 315 (1898); F.T.A. 10: 123 (1937).

- 1** Leaf-blades tightly involute, stiff and rigid; panicle dense, contracted; spikelets 5·5–6·5 mm. long, strictly 2-

flowered, enclosed by the thin 1-nerved glumes; lemmas 2–2.5 mm. long (entire part), obscurely 7-nerved, glabrous or sparsely pubescent below, the lateral lobes drawn out into fine bristles 2 mm. long, the awn geniculate with a twisted column[pictigluma](#)

Pentaschistis pictigluma (*Steud.*) *Pilger* in Not. Bot. Gart. Berlin 9: 517 (1926); F.T.A. 10: 133; Wickens in Kew Bull. 26: 41 (1971). *APD acc*

Aira pictigluma *Steud.*, Syn Pl. Glum. 1: 221 (1854).

Pentaschistis mannii *Stapf ex C. E. Hubbard* in Kew Bull. 1936: 501; F.T.A. 10: 134; F.W.T.A., ed. 1, 2: 528.

Tufted perennial up to 30 cm. high.

W. Cam.: Cam. Mt., 10,000 ft.-summit (Nov.–Jan.) Mildbr. 10894! Hinds C37! Maitland 1244! Migeod 197! Keay FHI 28625!

Also in **Sudan**, **Ethiopia**, **Uganda** and **Tanzania**.

28. TRIRAPHIS

R. Br., Prod. 185 (1810).

- 1 Panicle very dense, ovoid, 1–3 cm. long; spikelets about 3 mm. long and 3–11-flowered; lemmas 3-nerved, pilose, with a central awn 2–3 mm. long from the sinus of the briefly bilobed tip, and with the side nerves excurrent into shorter lateral awns; palea wingless; grain fusiform, 1–5 mm. long[pumilio](#)

Triraphis pumilio *R. Br.* in Denham & Clapperton, Narr. Trav. North & Centr. Afr., Append. 245 (1826); A Chev. in Rev. Bot. Appliq. 14: 131; De Miré & Gillett in J. Agric. Trop. 3: 701. *APD acc*

Triraphis glomerata *A. Camus* (1931) *Triraphis nana* (Nees) Hack. (1890).

Annual, 2–25 cm. high; **dry soils**.

Maur.: Mantounsi Rossetti 61/393! **Niger:** Tenéré (Sept.) P. de Fabrégues 922. Tazolé Chev. 42979. Air (fide De Miré & Gillett l.c.).

N. Africa from Mauritania to **Arabia**, and in **S. Africa**.

29. ELYTROPHORUS

P. Beauv., Ess. Agrost. 67 (1812); Schweickerdt in Ann. Nat. Mus. 10: 191; Jacques-Félix in J. Agric. Trop 5: 304.

- 1 Leaf-blades finely ridged above and below; ligule membranous, up to 1 mm. long; glumes lanceolate, aristately acuminate; lemma 0.6–1.5 mm. long, terminating in an awn 0.5–1.8 mm. long; keels of palea broadly winged or sometimes wingless; anthers 1–2 per floret[spicatus](#)

Elytrophorus spicatus (*Willd.*) *A. Camus* in Lecomte, Fl. Gen. Indo-Chine 7: 547 (1923); Berhaut, Fl. Sén. ed. 2, 396. *APD acc*

Dactylis spicata *Willd.* in Ges. Naturf. Freunde Berlin. Neue Schrift 3: 416 (1801).

Elytrophorus artirulatus *P. Beauv.* (1812).-Chev. Bot. 748, and in Rev. Bot. Appliq. 14: 134.

Phleum glomeruliflorum *Steud.*, Syn. Pl. Glum. 1: 150 (1854).

Annual, 15–60 cm. high; **swamps and old rice fields**.

Sen.: Richard Toll (Jan.) Roger 30! Tamboukané (Oct.) Chev. 2383! **Mali:** Dogo Demange 21/1957! Sole (Apr.) Davey 604! Mema (Oct.) Davey 497! Ansongo (Sept.) Hagerup 407! Macina (Sept.) Throughout the Old World tropics.

30. STIPAGROSTIS

Nees in *Linnaea* 7: 290 (1832); *de Winter* in *Bothalia* 8: 307 (1965).

- 1 Glumes pubescent; lemma strongly papillose; awn 5–6 cm. long, the column hairy below the insertion of the lateral awns [1. *hirtigluma*](#)
- Glumes glabrous; lemma smooth or weakly papillose: **2**
- 2 Awn with a dense tuft of hairs at the insertion of the lateral awns; column 5–6 mm. long, the central awn 20–25 mm.; lemma about 2 mm. long with a callus about 0.5 mm. long; sheaths and internodes glabrous [2. *uniplumis*](#)
- Awn glabrous at the insertion of the lateral awns; lemma 3–4 mm. long, with a callus 1–1.5 mm.: **3**
- 3 Central awn 35–45 mm. long, the column 4–10 mm. long; basal sheaths and internodes densely woolly tomentose [3. *plumosa*](#)
- Central awn 10–15 mm. long, the column 1 mm. long; basal sheaths glabrous, the internodes silky hairy [4. *acutiflora*](#)

1. *Stipagrostis hirtigluma* (*Steud. ex Trin. & Rupr.*) *de Winter* in *Kirkia* 3: 134 (1963). *APD acc*

Aristida hirtigluma *Steud. ex Trin. & Rupr.*, *Sp. Gram. Stip.* 171 (1842); *A. Chev.* in *Rev. Bot. Appliq.* 14: 47.

Tufted annual with convolute leaf-blades, 45 cm. high.

Mali: Région nord Leclercq 42686! **N. Nig.:** Arege, Bornu (Sept.) Goss 5!

Extends eastward through the **Sudan**, **Ethiopia** and **Kenya** to **Arabia**, the Middle East and India; also in **Angola**, Botswana and South Africa.

2. *Stipagrostis uniplumis* (*Licht.*) *de Winter* in *Kirkia* 3: 136 (1963). *APD acc*

Aristida uniplumis *Licht.* in *Roem. & Schult.*, *Syst. Veg.* 2: 401 (1817).

A. papposa *Trin. & Rupr.*, *Sp. Gram. Stip.* 173 (1842), incl. var. *senegalensis* *Trin. & Rupr.*; *F.W.T.A.*, ed. 1, 2: 534; *Chev. Bot.* 741, and in *Rev. Bot. Appliq.* 14: 48; *Berhaut*, *Fl. Sén.* ed. 2, 406; *De Miré & Gillet* in *J. Agric. Trop.* 3: 728.

A. concinna *Sander* in *J. A. Schmidt*, *Beitr. Fl. Cap. Verd. Ins.* 140 (1852).

Stipagrostis papposa (*Trin. & Rupr.*) *de Winter* in *Kirkia* 3: 135 (1963).

Caespitose perennial up to about 60 cm. high.

Sen.: Jardin! **Leprieur!** **Mali:** Région nord Leclercq 42740! **Bamba** (Sept.) **Hagerup** 324! **Gidigada** (Aug.) **Lean** 86! **Kidal** (Sept.) **Rossetti** 59/154!

Throughout much of tropical and S. Africa.

3. *Stipagrostis plumosa* (*Linn.*) *Munro ex T. Anders.* in *J. Linn. Soc.* 5, *Suppl.* 1: 40 (1860). *APD acc*

Aristida plumosa *Linn.*, *Sp. Pl.* ed. 2, 1966 (1763), incl. var. *floccosa* (*Coss. & Dur.*) *Henr.* (1926); *F.W.T.A.*, ed. 1, 2: 534; *Chev. Bot.* 741, and in *Rev. Bot. Appliq.* 14: 48, 109; *De Miré & Gillet* in *J. Agric. Trop.* 3: 728.

Densely caespitose perennial with convolute leaf-blades; 30–45 cm. high.

Maur.: Twisti **Legehatin**, **Aouker Rossetti** 61/352! **Sen.:** Lelièvre! **Niger:** in **Abangarit** (Dec.) **Proudlock** 5! **Tasolé** (Feb.) **Chev.** 44195!

Throughout N. Africa from Mauritania to the **Sudan**, extending through **Arabia** and the Middle East to India.

4. *Stipagrostis acutiflora* (*Trin. & Rupr.*) *de Winter* in *Kirkia* 3: 133 (1963). *APD acc*

Aristida acutiflora *Trin. & Rupr.*, *Sp. Gram. Stip.* 167 (1842); *F.W.T.A.*, ed. 1, 2: 534; *Chev. Bot.* 740, and in *Rev. Bot. Appliq.* 14: 45; *De Miré & Gillet* in *J. Agric. Trop.* 3: 726.

Slender caespitose or stoloniferous perennial, with narrowly convolute curved leaf-blades; up to about 45 cm. high.

Maur.: Oualata **Rossetti** 61/157! **Mali:** Région nord Leclercq 42589! **Oualata** to **Neissa Jumelle** 4!

N. Africa from Mauritania to **Egypt** and the **Sudan**.

Stipagrostis ciliata (*Desf.*) *de Winter* in *Kirkia* 3: 133 (1963). *APD acc*

Aristida ciliata *Dest.* in *Schrad., Neues J. Bot.* 3: 225 (1809).

Awn disarticulating by a break in the body of the lemma itself, the central limb plumose in the upper half and up to 45 mm. long.

Recorded at Aïr by De Miré & Gillet in *J. Agric. Trop.* 3: 727 (1956).

A species from the **Mediterranean** and **Orient**.

Additional species.

Stipagrostis pungens (*Desf.*) *de Winter* in *Kirkia* 3: 135 (1963). *APD acc*

APD: Synonym of Stipagrostis vulnerans (Trin. & Rupr.) De Winter

Aristida pungens *Desf.*, *Fl. Atlant.* 1: 109 (1798).

Differs from other W. African species of *Stipagrostis* in that all three awns are plumose.

Recorded at Aïr by De Miré & Gillet in *J. Agric. Trop.* 3: 728 (1956).

N. Africa.

Additional species.

31. ARISTIDA

Linn., *Sp. Pl.* 82 (1753), and *Gen. Pl.* ed. 5, 35 (1754); *Henrard* in *Mededeel. Rijks Herb. Leiden* 54 (1926), 54A (1927), 54B (1928), 54C (1933) 58 (1929) and 58A (1932). *APD acc*

Sect. 1—ARISTIDA

- 1 Lateral awns absent; delicate annual [1. diminuta](#)
Lateral awns present: **2**
- 2 Plants perennial; densely tufted: **3**
Plants annual: **4**
- 3 Lemma at most beaked; base of plant clothed in the fibrous remains of old leaf-sheaths; upper glume 5–7.6 mm. long; awns 6–8 mm. long [3. recta](#)
Lemma drawn out into a slightly twisted column 1–3 mm. long; base of plant lacking fibres, often shortly rhizomatous; upper glume 6–9 mm. long; awns 8–20 mm. long [4. junciformis](#)
- 4 Spikelets 2–2.5 mm. long (excluding awns) [2. cumingiana](#)
Spikelets 5 mm. long or more: **5**
- 5 Glumes subequal, 9–12 mm. long; panicle rather stiff, the branches ascending; lemma 9–11 mm. long, bearing longitudinal rows of spiny hooked hairs; awn usually 15–25 mm. long [5. rhiniochloa](#)
Glumes unequal, the lower about 2/3 as long as the upper which is 6–10 mm. long; panicle flexuous, the branches secund; lemma 5–15 mm. long, glabrous or scabrid, very rarely tuberculate; awn usually 10–20 mm. long [6. adscensionis](#)

Sect. 2—PSEUDOCHEAETARIA

- 1 Panicle dense and continuous, spike-like, 4–12 cm. long, the branches always very short and the spikelets fascicled; glumes with awns 2–5 mm. long; internodes and leaf-sheaths densely but very shortly pubescent; blades glaucous, flat, up to 6 mm. broad [7. hordeacea](#)
Panicle loose, with slender branches up to 10 cm. long; branches naked in the lower part, and densely clothed with spikelets towards the tip; glumes with awns 1–2 mm. long; internodes and leaf-sheaths glabrous; blades narrow, more or less convolute [8. kunthiana](#)

Sect. 3—ARTHATHERUM

- 1 Lower glume longer than the upper, the former 20–30 mm. long, the latter 3–6 mm. shorter; callus conical; column of awn up to 4.5 cm. long, the limbs 3.5–4.5 cm. long [9. funiculata](#)
Lower glume shorter than the upper, rarely the glumes subequal: **2**
- 2 Callus at base of mature floret bifid: **3**
Callus conical, obliquely acute; panicle dense; lower glume 9–12 mm. long, upper 12–18 mm. with an awn 5–10 mm. long from the sinus of the bifid apex; column of awn 1–3 cm. long [12. sieberana](#)

- 3 Panicle linear, the spikelets almost sessile; glumes long awned, the lower about 20 mm., the upper 25–35 mm. long; column of awn 5–7 cm. long, the limbs 6–8 cm. long [10. kerstingii](#)
- Panicle diffuse, delicate, the spikelets upon slender filiform pedicels; glumes obtuse, at most mucronate, the lower 5–7 mm., the upper 14–20 mm. long; column of awn 1.5–3 cm. long [11. stipoides](#)

Sect. 4—PSEUDARTHATHERUM

- 1 Spikelets congested at the tips of the branches; glumes usually subequal, 4–7 mm. long; lemma 4–5 mm. long, surmounted by a column 2–5 mm. long; leaf-blades narrow, convolute [13. mutabilis](#)

1. *Aristida diminuta* (Mez) C. E. Hubbard in Kew Bull. 4: 480 (1949). *APD acc*

Southward to the Transvaal.

4. *Aristida junciformis* Trin. & Rupr. Sp. Gram. Stip. 143 (1842). *APD acc*

Tufted perennial 30–60 cm. high; [poor stony soils](#).

N. Nig.: Chappal Waddi (Apr., Nov.) Jackson, Magaji & Tuley 2030! Gbile & Daramola FHI 63287!

Kenya to South Africa.

5. *Aristida rhiniochloa* Hochst. in Flora 38: 200 (1855). *APD acc*

Aristida rigidiseta Pilger (1914).

Annual with flat leaf-blades 2–4 mm. wide; up to 60 cm. high.

Maur.: (Aug.) Rossetti 61/170! **Mali:** Boré (Oct.) Davey 3/1957! **Niger:** Kao-Kiloum (Sept., Dec.) P. de Fabrègues 1337, 2072 (fide Lebrun in Adansonia 7: 395 (1967)).

Also in **Ethiopia**, **Sudan** and **Eritrea**; and from Tanzania south to the Transvaal.

6. *Aristida adscensionis* Linn. Sp. Pl. 82 (1753); Henrard l.c. 322; Chev. Bot. 740, and in Rev. Bot.

Appliq. 14: 45; Berhaut, Fl. Sén. ed. 2, 407; De Miré & Gillet in J. Agric. Trop. 3: 726; incl. subsp. *guineensis* (Trin. & Rupr.) Henr. (1926), var. *festucoides* (Poir.) Henr. (1926), and var. *senegalensis* (Trin. & Rupr.) Dur. & Schinz (1894). *APD acc*

Aristida submucronata Schumacher, Beskr. Guin. Pl. 67 (1827).

Aristida festucoides Poir., Encycl. Meth. Bot., Suppl. 1: 453 (1810).

Aristida guineensis Trin. & Kupr., Sp. Gram. Stip. 137 (1842).

Aristida vulgaris var. *senegalensis* Trin. & Rupr. l.c. 135.

Aristida thonningii Trin. & Rupr. l.c. 137.

Annual, up to about 1 m. high, leaf-blades often becoming involute; common on dry, shallow or over-farmed soils.

Sen.: Leprieur! Roger! Heudelot 539! Longa (Oct.) Berhaut 2807! Malika (Aug.) Broadbent 27! **Mali:** Leclercq 42706! Sompi (Aug.) Chev. 2381! Gao (Sept.) Hagerup 357! Timbuktu Hagerup 158! L. Maiduguri (Oct.) Johnston W42! Kauwa (Oct.) Gwynn 126! Mongonu (Oct.) Golding 15!

Extends eastwards through the **Sudan**, **Kenya** and **Arabia** to India, southwards into Tanzania. (See Useful Plants.)

A. mutabilis may be separated from *A. meccana* by its subequal glumes (greatest difference in glume length 0.2–2.2 mm. in the former, 2.2–4.2 mm. in the latter). African populations clearly show modal values corresponding to one or both of these ranges, but the distinction is not sharp; moreover Indian plants display an intermediate range. These entities seem to be geographical races rather than independent species.

Aristida caerulescens Desf. Fl. Atlant. 1: 109 (1798). *APD acc*

Distinguished from *A. adscensionis* by its perennial habit.

Recorded on the northern limit of our area at Air by Be Miré & Gillet in J. Agric. Trop. 3: 727 (1956).

Mediterranean and **Orient**.

Additional species.

32. CENTOTHECA

Desv. in Nouv. Bull. Soc. Philom. 2: 189 (1810).

- 1 Leaf-blades lanceolate, 1.5–3 cm. broad; spikelets lanceolate, up to 8 mm. long, terete or slightly compressed; lemmas emarginate and mucronate at the tip, the lowest glabrous, the upper with reflexed tubercle-based bristles [lappacea](#)

Centotheca lappacea (Linn.) Desv. in Nouv. Bull. Soc. Philom. 2: 189 (1810); Chev. Bot. 751, and in Rev. Bot. Appliq. 14: 135; Berhaut, Fl. Sén., ed. 2, 408. *APD acc*

Cenchrus lappaceus Linn., Sp. Pl. ed. 2, 1488 (1763).

Uniola lappacea (Linn.) Trin. (1830). *Holcus latifolius* Osb. (1757).

Centotheca latifolia Trin. (1820), illegitimate name.

Annual, 30–90 cm. high; **in forest shade**.

Enneapogon elegans (Nees ex Steud.) Stapf in Kew Bull. 1907: 224; A. Chev. in Rev. Bot. Appliq. 14: 132.

Tufted perennial up to 1 m. high.

Mali: Ansongo (Sept.) Hagerup 397! **Niger:** Air (fide De Miré & Gillet).

Extends eastwards to **Sudan**, **Ethiopia**, and **Arabia**.

[Note: *Pappophorum senegalense* Steud (1854) (= *Enneapogon cenchroides* (Roem. & Schult.) C. E. Hubbard) was actually collected in Gabon, not Senegal.]

35. SCHMIDTIA

Steud. ex J. A. Schmidt, Beitr. Fl. Cap. Verd. Ins. 144 (1852), nom. cons.; Launert in Bol. Soc. Brot. 39: 303 (1965).

- 1 Panicle narrow, 6–12 cm. long, the branches and spikelets softly pubescent all over; spikelets about 1 cm. long; glumes membranous, ovate-lanceolate, acute, 4.5–9 mm. long, 9-nerved; lemmas broadly obovate, with 5 bristles 4.5–9 mm. long, alternating with 6 hyaline lobes 2 mm. long [pappophoroides](#)

Schmidtia pappophoroides *Steud. ex J. A. Schmidt* Beitr. Fl. Cap. Verd. Ins. 145 (1852); A. Chev. in Rev. Bot. Appliq. 14: 132; Berhaut, Fl. Sén. ed 2, 408. *APD acc*

Schmidtia bulbosa *Stapf* in Fl. Capensis 7: 658 (1900).

Caespitose or almost suffrutescent perennial, softly pilose all over.

Maur.: Néma Rossetti 61/137! **Sen.:** Walo Heudelot 516!

Extends eastward to the [Sudan](#) and [Kenya](#), and south to [Angola](#).

36. AELUROPUS

Trin., Fund. Agrost. 143 (1820). *APD acc*

- 1 Culms procumbent, stoloniferous, wiry and woody; leaf-blades subulate-lanceolate, pungent, glabrous, 1.5–3 cm. long; spikelets ovate, 2–5 mm. long, softly villous; lemmas 5–9-nerved, mucronate [lagopoides](#)

Aeluropus lagopoides (*Linn.*) *Trin. ex Thw.* Enum. Pl. Zeyl. 374 (1864); Bor in Webbia 24: 401 (1969). *APD acc*

Dactylis lagopoides *Linn.*, Mant. 33 (1767).

D. brevifolia *Koenig ex Willd.*, Sp. Pl. 1: 410 (1797).

Aeluropus laevis *Trin.*, Fund. Agrost. 143 (1820).

Aeluropus repens (*Desf.*) *Parl.* (1848)—A. Chev. in Rev. Bot. Appliq. 14: 134.

Perennial; [seashores](#), and [saline soils inland](#).

Maur.: Keur Masséne Rossetti 59/8! Nouakchott to Rosso (Nov.) Adam 19584!

From the Mediterranean to the Punjab, reaching southwards into the [Sudan](#), [Ethiopia](#) and Somaliland.

37. ERAGROSTIS

Wolf, Gen. Pl. Vocab. Char. Def. 23 (1776).

- 1 Keels of paleas ciliate, the hairs spreading beyond the margins of the lemmas; spikelets 1.5–4.5 mm. long and 1–2.5 mm. wide, breaking up from the apex downwards; lemmas obtuse: **2**
Keels of paleas glabrous or minutely ciliate (rarely ciliate, but then concealed within the lemma—E. plurigluma): **5**
- 2 Lemmas, or at least the upper, with a few short stiff hairs on the keel; panicle spike-like, woolly, more or less lobed or interrupted, typically 4–12 cm. long and 5–15 mm. wide, the spikelets densely clustered; spikelets 2–4.5 mm. long and 1.5–2 mm. wide; upper glume 1–1.2 mm. long; lemma narrowly elliptic in side view, 0.9–1.5 mm. long; palea hairs much longer than the width of the floret; anthers 2; grain 0.3–0.5 mm. long **1**. [ciliaris](#)
Lemmas smooth or scaberulous on the keel; anthers 3: **3**
- 3 Inflorescence sticky from glands on branchlets and glumes, to which grains of sand adhere **2**. [viscosa](#)
Inflorescence with or without glands, but not sticky: **4**
- 4 Panicle dense, linear-elliptic, 4–22 cm. long and 5–25 mm. wide, not lobed or woolly, nor with the spikelets clustered; spikelets 2–4.5 mm. long and 1.5–2.5 mm. wide; upper glume 1–1.5 mm. long; lemma narrowly elliptic in side view, 1–1.5 mm. long, glabrous on the keel; palea hairs about as long as the width of the floret;

- grain 0.5 mm. long [3. arenicola](#)
- Panicle open, pyramidal to elliptic, 2–14 cm. long and 10–30 mm. wide, the spikelets scattered; spikelets 1.5–2.5 mm. long and 1–1.5 mm. wide; upper glume 0.7–1 mm. long, lemma elliptic in side view, 0.5–1 mm. long, scaberulous on the keel; palea hairs usually shorter than the width of the floret; grain 0.4–0.6 mm. long [4. tenella](#)
- 5 Spikelets breaking up from the apex downwards, the rhachilla disarticulating between the florets so that lemma and palea fall together enclosing the grain; spikelets up to 1.5 mm. wide; lemmas obtuse: [6](#)
- Spikelets breaking up from the base upwards, the rhachilla persistent (except *E. egregia*), and the lemma and palea falling separately: [8](#)
- 6 Panicle ovate-elliptic, 20–35 cm. long and 7–15 cm. wide, loose, the spikelets on long fine pedicels; spikelets 4–10 mm. long, 6–22-flowered, 1–1.5 mm. wide; ligule reduced to a ciliate rim; lemma 1.2–1.7 mm. long; keels of palea scabrid; anthers 3; grain subglobose [5. aspera](#)
- Panicle linear to lanceolate, 10–60 cm. long and 1–5 cm. wide, dense, the spikelets short pedicelled; spikelets 1.3–2.2 mm. long, 4–10-flowered, 0.8–1 mm. wide; ligule membranous, 0.5 mm. long; lemma 0.7 mm. long; anthers 2; grain ellipsoid [7](#)
- 7 Keels of palea smooth [6a. namaquensis var. namaquensis](#)
- Keels of palea scaberulous [6b. namaquensis var. diplachnoides](#)
- 8 Glumes pubescent to pilose; lemmas hairy near the margins or only with a few short hairs at the base; spikelets ovate to oblong; paleas deciduous; anthers 3: [9](#)
- Glumes and lemmas glabrous (or the latter with a few scurfy hairs when young in *E. pobeguinii*): [11](#)
- 9 Perennial; spikelets 4–6.5 mm. wide; lemmas 3–3.5 mm. long, acute, glandular on keel and nerves, hairy near the margins; panicle glandular on branches and pedicels; leaf-blades flat, 3–9 mm. wide and 10–30 cm. long; grain broadly oblong, flattened, 1–6 mm. long [7. blepharostachya](#)
- Annuals; spikelets 2.5–4.5 mm. wide; lemmas 1.8–2.5 mm. long: [10](#)
- 10 Lemmas thinly chartaceous, with a line of white tubercle based hairs near the margins and a few glands on the nerves, obtuse to subacute; panicle glandular on branches and pedicels; spikelets 3–8 mm. long and 2.5–3.5 mm. wide; leaf-blades flat or rolled, 2–18 cm. long and 2–7 mm. wide; grain broadly oblong, plump, 0.7 mm. long [8. scotelliana](#)
- Lemmas coriaceous, glabrous except for a few short rigid hairs at the base, closely packed, broadly rounded at the apex; panicle branches and pedicels usually without glands; spikelets 3–20 mm. long and 3–4 mm. wide; leaf-blades flat, 4–18 cm. long and 2–8 mm. wide; grain broadly elliptic, plano-convex, 1–1.5 mm. long [9. turgida](#)
- 11 Lower 2–5 florets barren, smaller in size, the palea absent or reduced; anthers 3: [12](#)
- Lower florets fertile, as large as or larger than the upper: [14](#)
- 12 Spikelets linear, 9–15 mm. long and 2.5–4 mm. wide, breaking above the sterile lemmas and the upper part falling entire at maturity; lower 3–4 lemmas reduced, the lowest without a palea and glume-like; fertile lemmas imbricate, acute, 2.5–3 mm. long; anthers 2–3, 0.7–1.3 mm. long [10. egregia](#)
- Spikelets ovate to broadly elliptic, 4–6 mm. long and 2–4 mm. wide, the florets falling separately; paleas deciduous: [13](#)
- 13 Fertile lemmas obtuse at the tip, chartaceous, imbricate; paleas ciliate on the keels, the cilia 0.2–0.4 mm. long; barren lemmas 3–5, without paleas [11. plurigluma](#)
- Fertile lemmas acute at the tip, firmly membranous, contiguous; paleas shortly ciliolate on the keels, the cilia 0.1–0.2 mm. long; barren lemmas 2, without paleas [12. cenolepis](#)
- 14 Keels of paleas broadly winged, the wings up to 0.5 mm. wide and folding over the sides of adjacent lemmas; spikelets ovate to oblong, 6–13 mm. long and 4–5 mm. wide, light olive green; lemmas lanceolate, acute, 3–4 mm. long; paleas deciduous; leaf-blades up to 5 mm. wide, but usually narrower and tightly convolute; anthers 3 [13. invalida](#)
- Keels of paleas not or only very narrowly winged: [15](#)
- 15 Paleas falling at about the same time as the lemmas: [16](#)
- Paleas not deciduous, persisting long after the lemmas have fallen: [24](#)
- 16 Leaf-blades spreading horizontally or becoming reflexed, 0.5–6 cm. long and 0.5–2 mm. wide, flat or rolled; spikelets ovate-oblong to oblong, 4–7 mm. long and 2.5–4 mm. wide, dark olive green; lemmas broadly ovate-oblong, 1.3–2.5 mm. long, loosely contiguous, obtuse to subacute, firmly chartaceous, dully shining; keels of the palea narrowly winged, ciliolate; anthers 3 [14. volkensii](#)
- Leaf-blades mostly erect or sometimes obliquely spreading: [17](#)
- 17 Annuals; anthers 0.2 mm. long: [18](#)
- Perennials; spikelets 1.5–3.5 mm. wide; grain ellipsoid, 0.7–0.9 mm. long; anthers 3: [21](#)

- 18 Spikelets ovate to ovate-oblong, 2–3.5 mm. wide; anthers 2: 19
 Spikelets linear, 1–1.5 mm. wide: 20
- 19 Lemmas suborbicular in side view, obtuse at the tip when flattened, firmly chartaceous, olive green, dully shining; panicle stiff, 5–12 cm. long and 3–7 cm. wide, the lateral pedicels 1–2 mm. long; spikelets 3–5.5 mm. long and 2–2.5 mm. wide [15. mokensis](#)
 Lemmas narrowly ovate in side view, acute at the tip when flattened, membranous, tinged with pink or purple; panicle delicate, 5–12 cm. long and 2–6 cm. wide, the lateral pedicels 2–10 mm. long; spikelets 4–12 mm. long and 2–3.4 mm. wide [16. unioides](#)
- 20 Grain subglobose, 0.4–0.6 mm. long; lowest branches of the panicle not whorled, usually solitary, glabrous in the axil; lemmas narrowly ovate, acute to subobtuse, 1–1.5 mm. long, diverging at about 45° from the rhachilla and 3–4 times as long as its internodes; spikelets 4–10 mm. long; glumes lanceolate, about 1/2 as long as the adjacent lemmas; leaf-blades up to 15 cm. or more long, rolled or flat, 1–3 mm. wide; anthers 2 [17. gangetica](#)
 Grain ellipsoid, 0.6–1 mm. long, flattened on one side; lowest branches of the panicle whorled (except in the smallest panicles), usually with a few long white hairs in the axil; lemmas lanceolate-oblong, subacute or obtuse, 1.4–2 mm. long, more or less appressed to the rhachilla and 2–2 1/2 times as long as its internodes; spikelets 3–7 mm. long, 4–14-flowered; leaf-blades up to 20 cm. long, flat or rolled, 1–4 mm. wide; anthers 3 [18. pilosa](#)
- 21 Spikelets ovate to ovate oblong, 5–15 mm. long and 3–3.5 mm. wide, long-pedicelled in large open loose panicles up to 35 cm. long and 25 cm. wide; culms herbaceous; lemmas obliquely ovate in side view, 2–3 mm. long, grey, firmly chartaceous; anthers 1 mm. long [19. chalarothyrsos](#)
 Spikelets linear: 22
- 22 Flowering culms woody, branched and geniculate, rooting at the nodes, and eventually functioning as stolons; lemmas 2–2.3–2 mm. long, lanceolate in side view, acute at the tip when flattened, thinly chartaceous; anthers 0.9–1.3 mm. long; spikelets 2–3 mm. wide and 8–16 mm. long, pallid, loose, the rhachilla clearly visible; panicle lax [20. barteri](#)
 Flowering culms herbaceous, erect; lemmas 1.4–2 mm. long, narrowly ovate in side view, firmly chartaceous; anthers 3, 0.4–1 mm. long; spikelets 1.5–2.5 mm. wide and 5–20 mm. long, dense, the rhachilla concealed by the florets: 23
- 23 Leaf-blades 15–30 cm. long and 2–4 mm. wide, flat or rolled; culms 45–100 cm. high and 1.5–3 mm. diam. at base, leafy; panicle ovate or oblong, spikelets more or less clustered about the obliquely ascending primary branches; spikelets pallid to grey or purple; lemmas 1.4–2 mm. long, acute to subacute at the tip when flattened [21. atrovirens](#)
 Leaf-blades 3–7 cm. long and 1–2 mm. wide, usually rolled; culms about 30 cm. high and 1 mm. diam. at base, wiry, leafless, the leaves mostly basal; panicle linear, the spikelets clustered about the main axis; spikelets dark grey; lemmas 1.4–1.7 mm. long, obtuse at the tip when flattened [22. camerunensis](#)
- 24 Margins of leaf-blades bearing warty glands, the blades flat, 3–11 mm. wide, glabrous; panicle ovate to oblong, open or contracted, loose or dense, 3–25 cm. long and 2–12 cm. wide, usually bearing glands on branches and pedicels; spikelets narrowly oblong to oblong or ovate-oblong, pallid yellowish green to leaden grey; lemmas ovate to ovate-oblong, obtuse; grain subglobose, up to 0.6 mm. long: 25
 Margins of leaf-blades not glandular (rarely with tubercle-based hairs in *E. pobeguinii*); spikelets linear to narrowly oblong: 26
- 25 Spikelets 2–4 mm. wide; lemmas 2–2.8 mm. long [23. cilianensis](#)
 Spikelets 1.3–2 mm. wide; lemmas 1.5–2 mm. long [24. minor](#)
- 26 Perennials: 27
 Annuals: 30
- 27 Panicle scantily branched, bearing up to 15 spikelets, linear, 3–12 cm. long and 0.5–2 cm. wide; spikelets 3–5 mm. wide and 7–18 mm. long, narrowly oblong, pallid to olive-grey; basal sheaths bulbously swollen and hardened below; leaf-blades up to 2 mm. wide, usually rolled and setaceous, pilose with tubercle-based hairs; lemmas 3–4 mm. long, firmly chartaceous, acute, with or without a few deciduous scurfy hairs near the base [25. pobeguinii](#)
 Panicle bearing numerous spikelets; spikelets up to 2.5 mm. wide; basal sheaths not swollen: 28
- 28 Lemmas closely imbricate, their sides pressed flat against adjacent lemmas for almost their entire length; spikelets 5–25 mm. long and 2–2.5 mm. wide, purplish grey; leaf-blades stiff, up to 6 mm. wide, but usually much narrower and rolled, densely scabrid above; panicle elliptic, stiff, open, the spikelets short-pedicelled and loosely appressed to the branches; anthers 2 [26. squamata](#)
 Lemmas contiguous, free from adjacent lemmas for much of their length; pedicels long and slender; anthers 3: 29
- 29 Lower glume about 2/3 as long as the upper, the latter 0.8–1.4 mm. long and barely reaching the base of the adjacent lemma; spikelets dark green, the margins conspicuously saw-toothed; panicle elliptic, open, 5–20 cm. long [27. tenuifolia](#)

Lower glume about as long as the upper, the latter 1.5–2 mm. long and reaching at least to the middle of the adjacent lemma; spikelets pale brownish-green; panicle linear to lanceolate, 10–30 cm. long, the slender flexuous branches ascending close to the axis [28. *domingensis*](#)

- 30** Florets appressed to the rachilla; spikelets 0.8–1.5 mm. wide; anthers 3; grain ellipsoid, 0.5–0.7 mm. long: **31**

Florets diverging at 45°; panicle not whorled (sometimes the lowest branches irregularly whorled in E. macilenta): **32**

- 31** Lower glume as long as lower lemma; panicle narrowly ovate, the branches in successive whorls; spikelets grey, 3–8 mm. long; lemmas 1.5–1.7 mm. long, obtuse; anthers 0.8–1 mm. long [29. *cylindriflora*](#)

Lower glume half as long as lower lemma; panicle at first linear and embraced by the uppermost sheath, but the branches spreading at maturity; spikelets pallid, 3.5–15 mm. long; lemmas 1.2–1.7 mm. long, subacute; anthers 0.2 mm. long [30. *aegyptiaca*](#)

- 32** Spikelets very dark green to almost black, oblong, 3–6 mm. long and 1–2 mm. wide, loosely 6–14-flowered; glumes acuminate, 1–1.5 mm. long; lemmas 1.3–1.6 mm. long, acute; anthers 3, 0.5 mm. long; grain broadly oblong, 0.5 mm. long; panicle ovate-elliptic, up to 35 cm. long, diffuse [31. *macilenta*](#)

Spikelets pallid to purplish, 1.5–2.5 mm. wide: **33**

- 33** Lemmas obtuse at the tip when flattened, 1.5–2 mm. long; anthers 2, 0.1–0.3 mm. long; grain subglobose, 0.5 mm. long: **34**

Lemmas acute at the tip when flattened: **35**

- 34** Base of the florets interleaved with those of the opposite row; panicle ovate to elliptic, 5–50 cm. long, very loose, the spikelets trembling on slender pedicels; spikelets 8–50 mm. long, 10–100-flowered [32. *tremula*](#)

Base of the florets free from those of the opposite row; panicle ovate and open to linear and contracted, 4–15 cm. long; spikelets 8–25 mm. long, 14–50-flowered [33. *elegantissima*](#)

- 35** Panicle linear to narrowly elliptic, dense, the spikelets closely clustered about the primary branches; spikelets 7–35 mm. long and 2–2.5 mm. wide, 10–100-flowered, pallid or pinkish brown; lemmas 2.5–2.7 mm. long, imbricate; anthers 2, 0.1–0.2 mm. long; grain subglobose, 0.3–0.4 mm. long; leaf-blades flat, up to 4 mm. wide [34. *lingulata*](#)

Panicle elliptic, open, the spikelets uniformly distributed; spikelets 3–9 mm. long and 1.5–2 mm. wide, 7–30-flowered, purplish; glumes 1–2 mm. long, lanceolate, covering 3/4 of the adjacent lemma or more; lemmas 1.5–2 mm. long, contiguous; anthers 3, 0.3–0.4 mm. long; grain subglobose, 0.4 mm. long [35. *welwitschii*](#)

- 1. *Eragrostis ciliaris* (Linn.) R. Br.** in Tuckey, Narr. Exp. Congo, Append. 478 (1818); Chev. Bot. 749, and in Rev. Bot. Appliq. 14: 117; Berhaut, Fl. Sén. ed. 2, 396; De Miré & Gillet in J. Agric. Trop. 3: 732. *APD acc*

Poa ciliaris Linn., Syst. Nat. ed. 10, 2: 875 (1759).

Eragrostis pulchella Parl. in Atti Riun. Sci. Ital. 8: 586 (1847).

Annual 15–60 cm. high; **a common weed of roadsides, cultivated land and waste places.**

Throughout tropical Africa, and in India. (See Useful Plants.)

A rather variable species; panicle typically condensed about the primary branches, but sometimes diffuse with capillary branchlets; in the northern part of our area the spikelets tend to be longer than elsewhere, and the paleas may be only tardily deciduous; a form found on Ironstone pans (*E. dumasiana* see Lebrun in Bull. Soc. Bot. Fr. 116: 260 (1969)) appears to be a short-lived perennial, but is otherwise identical with plants which are certainly annual; it may be confused with the very similar perennial species *E. atrovirens*, which has 3 stamens.

18. **Eragrostis pilosa** (Linn.) P. Beauv. Ess. Agrost. 162, 175 (1812); Berhant, Fl. Sén. ed. 2, 408; De Miré & Gillet in J. Agric. Trop. 3: 733. *APD acc*

Also in **south tropical Africa**, with isolated specimens from Tanzania, **Ethiopia**, Congo Republic and E. Cameroun.

1. *Eragrostis barrelieri* *Daveau* in Journ. de Bot. 8: 289 (1894). *APD acc*

APD: Synonym of *Eragrostis papposa* (Roem. & Schult.) Steud.

Closely resembles *E. minor*, differing in the narrower unequal glumes, longer appressed lemmas and eglandular leaf margins.

Recorded from Air by De Miré & Gillet in J. Agric. Trop. 3: 732 (1956).

Additional species.

2. *Eragrostis trichophora* Coss. & Dur. in Bull. Soc. Bot. Fr. 2: 311 (1855). *APD acc*

Eragrostis atherstonei Stapf (1900).

Similar to *E. cylindriflora* but perennial.

Recorded from Air by De Miré & Gillet in J. Agric. Trop. 3: 733 (1956).

A North and South African species.

Additional species.

38. TRIPOGON

Roem. & Schult., Syst. Veg. 2: 34 (1817); Phillips & Launert in Kew Bull. 25: 301 (1971).

- 1 Spikelets 10–12 mm. long, dark green; glumes subequal, sharply pointed, 7–8 mm. long; lemmas 5 mm. long with a stout awn-point 1–2 mm. long *1. major*

Spikelets 2.5–4 mm. long, closely appressed to the rachia; upper glume 2–3 mm. long, the lower half as long; lemmas 1–2 mm. long, minutely mucronate *2. minimus*

1. *Tripogon major* Hook. f. in J. Linn. Soc. 7: 230 (1864), incl. subsp. *jaegeranus* Gledhill & subsp. *deflexus* Gledhill in Bol. Soc. Brot. 41: 166 (1967). *APD acc*

Tripogon unisetus Pilger (1932).

Tripogon liebenbergii C. E. Hubbard (1934).

Tripogon snowdenii C. E. Hubbard (1934).

Tripogon jaegeranus A. Camus in J. Agric. Trop. 1: 212 (1954).

Densely tufted perennial about 30 cm. high, with narrow involute leaf-blades up to 15 cm. long; mountain grassland.

2. **Eleusine coracana** (Linn.) Gaertn. Fruct. 1: 8 (1789); Chev. Bot. 747, and in Rev. Bot. Appliq. 14: 129; Berhaut Fl. Sén. ed. 2, 399; Portères in Bull. I.F.A.N. 13: 1 (1951). *APD acc*

Cynosurus coracanus Linn., Syst. Nat. ed. 10, 2: 875 (1759).

A crop plant cultivated in Nigeria, particularly Jos Plateau, N. Cameroons and Lake Chad area. Also in E. Africa from **Ethiopia** to Natal and in India.

[Note: *E. africana* J. Kennedy-O'Byrne in Kew Bull. 12: 65 (1957), is a tetraploid species resembling diploid *E. indica*, with the lemmas (3.5-)4-5 mm. long, the spikelets 6-7.5 mm. broad, and the rhachis 1.5-2 mm. broad. Although some plants from our area encroach upon these dimensions, typical specimens of *E. africana* seem to be absent from our area.]

44. COELACHYRUM

Hochst. & Nees in Linnaea 16: 221 (1842).

- 1 Leaf-blades 2-6 cm. long and up to 5 mm. broad; inflorescence 4-5 cm. long, 3-5 branched; spikelets 3.5-4 mm. long, 6-8-flowered; lemmas broadly obtuse, yellowish green with 3 prominent dark green nerves, glabrous or hispidulous; grain more or less discoid, radiately grooved on one side and deeply hollowed on the other *brevifolium*

Coelachyrum brevifolium Hochst. & Nees in Linnaea 16: 221 (1842). *APD acc*

Coelachyrum oligobrachiatum A. Camus in Bull. Mus. Hist. Nat., sér. 2, 3: 546 (1931); F.W.T.A., ed. 1, 2: 518; De Miré & Gillet in J. Agric. Trop. 3: 701.

Eleusine brevifolia (Hochst. & Nees) Steud. (1854).

Eragrostis coelachyrum Benth. (1881).

Annual, 5-45 cm. high, the culms ascending from a loose tuft; a desert grass.

Mali: Tin Zaoutène (Sept.) Rossetti 191/59! **N. Nig.:** Arege (Oct.) Golding 37!

North Africa from Mauretania to **Egypt** and the **Sudan**, and in **Arabia**.

45. BEWSIA

Goossens in S. Afr. J. Sci. 37: 183 (1941).

- 1 Spikelets 2-4-flowered; glumes lanceolate, 2.5-8 mm. long; lemmas 4-6 mm. long, pubescent on either side of the mid-nerve below, obtuse or notched at the tip; awn up to 8 mm. long, arising about 1/3 the length of the lemma from its tip; grain terete *biflora*

Bewsia biflora (Hack.) Goossens in S. Afr. J. Sci. 37: 184 (1941). *APD acc*

Diplachne biflora Hack. in Bull. Herb. Boiss. 3: 387 (1895).

Tufted perennial 45-90 cm. high, the spikelets reddish brown; in woodland.

Dah.: Natitingou to Tangueta (Aug.) Adjanohoun 461! **N. Nig.:** Jos Plateau (Sept.) Tuley 1643!

Tanzania to South Africa.

46. POGONARTHRIA

Stapf in Fl. Capensis 7: 316 (1898).

- 1 Inflorescence linear, up to 20 cm. long and 3 cm. broad; racemes 1–2 cm. long, curved, divergent; spikelets 4–10 mm. long, 5–12-flowered, laterally compressed; glumes lanceolate, the lower 1 mm. long, the upper 1·5–2 mm.; lemmas 2–2·5 mm. long, keeled [suarrosa](#)

Pogonarthria suarrosa (*Licht. ex Roem. & Schult.*) *Pilger* in Notizbl. Bot. Gart. Berl. 5: 149 (1910).

APD acc

Poa suarrosa *Licht. ex Roem. & Schult.*, Syst. Veg. 2: 553 (1817).

Erect perennial 45–90 cm. high; **bare stony and disturbed soils.**

Ghana: Nungua (June) Ankrah GC 20152! **Dah.:** Agouagon (May) Chev. 23547! **N. Nig.:** Gombe to Bauchi (Dec.) Magaji MG 100! Sara Hills (Oct.) Hepper 1127! Isanlu Makatu (Jan.) Clayton 710! Yola to Biu (Nov.) Magaji & Tuley 1846! **S. Nig.:** Oyo (Nov.) Clayton 562!

Throughout tropical and S. Africa.

47. LEPTOCHLOA

P. Beauv., Ess. Agrost. 71 (1812).

- 1 Leaf-blades broad, oblong-lanceolate, 4–12 cm. long and 8–18 mm. broad, thin, flaccid, abruptly acute; glumes 2 mm. long, lanceolate, acuminate, exceeding the single floret; lemma 1·5 mm. long, acute [1. uniflora](#)
- Leaf-blades linear, 2–8 mm. broad, long-attenuate at the tip; spikelets 2–6-flowered; lemmas obtuse to emarginate: [2](#)
- 2 Racemes flexuous; culms typically 10–20-noded, hard, decumbent and rooting at the lower nodes; spikelets 2·5–3 mm. long, 3–6-flowered; lower glume narrowly lanceolate, 0·75–1 mm. long; upper glume narrowly oblong, 1·2–1·7 mm. long, obtuse or emarginate, mucronate; lemmas 1·5–2 mm. long, obscurely ciliolate on the nerves [2. caerulescens](#)
- Racemes straight; culms about 4-noded, erect: [3](#)
- 3 Upper glume linear to narrowly lanceolate, acute, 1·5–1·8 mm. long; lower glume 1·2–1·5 mm. long; spikelets 2–3 mm. long, 2–5-flowered; lemmas 1–1·5 mm. long, glabrous [3. filiformis](#)
- Upper glume narrowly oblong, obtuse and mucronate, 1–1·3 mm. long; lower glume 0·8–1 mm. long; spikelets 1·5–2 mm. long, 2–3-flowered; lemmas 1 mm. long, minutely mealy hairy [4. panicea](#)

1. **Leptochloa uniflora** *Hochst. ex A. Rich.* Tent. Fl. Abyss. 2: 409 (1851). *APD acc*

Craspedorhachis uniflora (*Hochst. ex A. Rich.*) *Chippendall* in Meredith, Grasses & Pastures of S. Africa 205 (1956).

Erect or trailing annual, 30–60 cm. high; **pathsides and fallow land.**

Ghana: New Tafo (Sept.) Lovi WACRI 3909! Ampam (Dec.) Adams 5030! Aburi (Mar., June, Sept.) Deighton 613! Ankrah GC 20050! Johnson 833! **S. Nig.:** Thomas 1764! Ibadan (May) Townrow 8! Idanre (Jan.) Brenan & E. W. Jones 8731! Aguku Dist. Thomas 1000! 1045!

Throughout tropical and S. Africa, and in **India** and **Ceylon**.

2. **Leptochloa caerulescens** *Steud.* Syn. Pl. Glum. 1: 209 (1854); *Berhaut*, Fl. Sén. ed. 2, 401. *APD acc*

Annual up to 1 m. high, sometimes erect but usually the culms decumbent and stolon-like at the base; near water.

Sen.: Roger 24! **Mali:** El Oualadji (Mar.) Chev. 43897! Koli-Koli Stream (July) Lean 50! Tondigamé (Oct.) Farrow 24! Labbézenga (Sept.) Hagerup 444! **Port. G.:** Nabijã (Dec.) Guerra 512! **S. Extends eastwards to the **Sudan**, and southwards through the Congo to **Angola** and Zambia.

3. *Leptochloa filiformis* (Lam.) P. Beauv. Ess. Agrost. 71, 161, 166 (1812).

APD: *Synonym of Leptochloa mucronata (Michx.) Kunth*

Festuca filiformis Lam., Tab. Encycl. 1: 191 (1791).

Erect annual 30–60 cm. high; **weedy places**.

Ghana: Ashanti (July) Akpabla 3856! **N. Nig.:** Ward 28! **S. Nig.:** Ibadan West! Moor Plantation, Ibadan (Mar.) Clayton 493!

A species of warm temperate and tropical America, introduced into W. Africa and **Angola**.

4. *Leptochloa panicea* (Retz.) Ohwi in Bot. Mag. Tokyo 55: 311 (1941). *APD acc*

Poa panicea Retz., Obs. Bot. 3: 11 (1783).

Leptochloa chinensis of F.W.T.A., ed. 1, 2: 517; of Chev. Bot. 748, and Rev. Bot. Appliq. 14: 121, not of (Linn.) Nees (1824).

Erect or ascending annual about 60 cm. high with slender racemes; **old farmland and weedy places**.

Ghana: Takoradi (Mar.) Deighton 559! Cape Coast (July) Hall 1515! Kpong (Dec.) Gyadu GC 20530! Achimota Akpabla! Nungua (Mar.) Clayton 950!

A species from tropical Asia; perhaps introduced, but now widely distributed in tropical Africa.

48. DIPLACHNE

APD: *Synonym of Leptochloa P. Beauv.*

P. Beauv., Ess. Agrost. 80 (1812).

Leaf-blades narrow, linear, tapering to a filiform point; racemes erect, with slightly flexuous branches up to 17 cm. long; glumes lanceolate, the lower 1–2 mm., the upper 2.5–4 mm. long; lemmas 2–3 mm. long, narrowly oblong, scarcely keeled, silky ciliate on the lateral nerves *fusca*

Diplachne fusca (Linn.) P. Beauv. ex Stapf in Fl. Capensis 7: 591 (1900); Chev. Bot. 748, and in Rev. Bot. Appliq. 14: 121; Berhaut, Fl. Sén. ed. 2, 407; De Miré & Gillet in J. Agric. Trop. 3: 731.

APD: *Synonym of Leptochloa fusca (L.) Kunth*

APD: *Synonym of Leptochloa fusca (L.) Kunth*

Festuca fusca Linn., Sp. Pl. ed. 2, 109 (1762).

Poa senegalensis Desf., Cat. Pl. Paris ed. 3: 21, 387 (1829), without description.

Uralespis alba Steud., Syn. Pl. Glum. 1: 248 (1854).

Tufted perennial with ascending culms 60–150 cm. high; spikelets olive green, becoming pallid; **in swamps**.

Sen.: Perrottet 926! Heudelot 499! Nouk (Jan.) Roger 59! Walo (Sept.) Perrottet 18! Seleki (Jan.) Chev. 2404! **Niger:** Zinder (Oct.) Hagerup 576! Agades (Dec.) de Wailly 4940! Maradi (Aug.) Hall 392! **N. Nig.:** Lake Chad (Dec.–June) Elliott 155! Jackson 2579! (FHI 59163!) Golding 85! Gwynn 129! De Leeuw 1896!

Throughout Africa, extending eastwards through the Orient and India, to China and Australia.

49. CTENIUM

Panz. in Denkschr. Acad. Muench. 1813: 288, t. 13 (1814), nom. cons.; Pilger in Notizbl. Bot. Gart. Berl. 9: 114 (1924); Clayton in Kew Bull. 16: 471 (1963).

- 1 Spikes solitary:2
Spikes 2–5, digitate (rarely solitary):4
- 2 Lemmas of both lower florets and palea of fertile floret with a line of yellow glands along the margin; second and third lemmas with 2–8 long bristles from side nerves near apex; annual, with flat leaf-blades 1–3 mm. broad; spike 10–30 cm. long, the rhachis shortly ciliate along the margins; lateral awn of the upper glume shorter than glume, rarely vestigial[1. elegans](#)
Lemmas without glands or bristles:3
- 3 Rhachis of spike villous along the margins (hairs 1–2 mm. long); annual, with flat leaf-blades up to 2 mm. broad; sterile lemmas subequal, keels glabrous, the ciliate margins of the lower forming a short, very dense, crest; fertile lemma 3.5–4 mm. long; spike 2–10 cm. long, coiled in a flat spiral [2. villosum](#)
Rhachis of spike shortly pubescent along the margins; perennial with narrow convolute leaf-blades; sterile lemmas unequal, the lower 1.5–2 mm. the upper 2–2.5 mm. long, margins and sometimes keels ciliate but not crested; fertile lemma 2.5–3 mm. long; spike (5-)7–20(-30) cm. long, almost straight or coiled in a lax corkscrew spiral [3. newtonii](#)
- 4 Upper glume 6.5–8 mm. long:5
Upper glume 3–4 mm. long; first lemma vestigial, or represented by an awn; second lemma 1.5–2 mm. long; fertile floret with entire lemma and 3-toothed palea [6. sesquiflorum](#)
- 5 Back of rhachis glabrous, the edges with a ciliate fringe; first lemma irregularly 3-toothed; second lemma entire, glabrous; margins of fertile lemma long ciliate [4. canescens](#)
Back of rhachis pubescent; sterile lemmas bilobed, the margins ciliate [5. ledermannii](#)

1. *Ctenium elegans* *Kunth* Rev. Gram. 1: 295 (1830); Pilger in Notizbl. Bot. Gart. Berl. 9: 115; A. Chev. in Rev Bot. Appliq. 14: 128 (incl. var. *longispicatum*); Berhaut, Fl. Sén. ed. 2, 390. *APD acc*

Chloris elegans (*Kunth*) *Roberty* in Bull. I.F.A.N. sér. A, 17: 51 (1955), not of Kunth (1816).

Ctenium serpentinum *Steud.*, Syn. Pl. Glum. 1: 202 (1854).

Up to about 120 cm. high, with aromatic leaves; on dry sandy soils.

5. **Ctenium ledermannii Pilger** l.c. 119 (1924). *APD acc*

Perennial 60–90 cm. high, with dark green paired spikes.

N. Nig.: Chappal Waddi (Nov.) Jackson, Magaji & Tuley 2053! **S. Nig.:** Obudu Plateau (Feb.) Tuley 492! 1019! **W. Cam.:** Bayango, Bamenda (Sept.) Ujor FHI 30215!

Also in **E. Cameroun** and **C. Afr. Rep.**

6. **Ctenium sesquiflorum W. D. Clayton** in Kew Bull. 14: 239 (1960). *APD acc*

About 30 cm. high, decumbent and rooting at the lower nodes.

Guin.: Ditinn to Diaguissa (Apr.) Chev. 12860! Ditinn (Apr.) Pitot!

50. TETRAPOGON

Desf., Fl. Atlant. 2: 388, t. 255 (1799).

- 1 Leaf-sheaths keeled, flabellate; ligule very short, ciliolate; blades linear, glaucous, about 6 cm. long, ciliate with long hairs towards the base; upper sheath dilated-spathaceous, with or without a short blade, enclosing the inflorescence; raceme solitary, one-sided, 4–5 cm. long; spikelets densely overlapping, truncate, with about 4 fertile florets, and 4 sterile florets above; glumes membranous, acuminate, the upper 7–9 mm. long; lemmas broadly ovate, villous, awned from just below the bilobed tip, the margins with a membranous wing above
.....*cenchriformis*

Tetrapogon cenchriformis (A. Rich.) W. D. Clayton in Kew Bull. 16: 250 (1962). *APD acc*

Lepidopironia cenchrifomis A. Rich., Tent. Fl. Abyss. 2: 442, t. 101 (1851).

Chloris cenchrifomis (A. Rich.) Baill. (1893).

C. savatieri Baill. (1893).

C. spathacea Hochst. ex Steud. (1854).

Tetrapogon spathaceus (Hochst. ex Steud.) Hack. ex Dur. & Schinz (1895)—F.W.T.A., ed. 1, 2: 520; Chev. Bot. 746, and in Rev. Bot. Appliq. 14: 131; Berhaut, Fl. Sén. ed. 2, 422; De Miré & Gillet in J. Agric. Trop. 3: 736.

Annual, 10–60 cm. high; **dry sandy or gravelly soils.**

Maur.: El Beyed Rossetti 61/325! **Sen.:** Dahra (Nov.) Raynal 7642 bis. **Mali:** Tabankort (Jan.) Chev.! Boulel (Oct.) Davey 055! Dorey (Aug.) Rossetti 59/125! **Niger:** Tanout (Apr.) Guile!

Also in **Cape Verde Islands**, and eastwards to **Kenya** and **Arabia**. (See Useful Plants.)

51. CHLORIS

Sw.: Prod. Veg. Ind. Occ. 25 (1788).

- 1 Lemma shortly awned, awn less than 1½ times as long as lemma:2
 Lemma long awned, awn over twice as long as lemma:5
- 2 Lemmas pilose with hairs 2 mm. long:3
 Lemmas shortly ciliate:4
- 3 Spikes 1–4 (usually 2), 4–7 cm. long, embraced below by the spathaceous upper leaf-sheath; upper glume 6 mm. long; lemma boat-shaped, dark brown, with an awn 4–6 mm. long from near the tip[1. lamproparia](#)
 Spikes 15–30, 10–15 cm. long, digitate or in tiers, the inflorescence silky hairy; upper glume 3 mm. long; lemma linear-lanceolate, pilose on the nerves with white hairs[2. robusta](#)
- 4 Spikelet conspicuously cuneate; upper lemmas 2, truncate, empty; awns 2, the longest about 3 mm. long [3. pilosa](#)
 Spikelet not cuneate; upper lemmas 1 or 2, subacute in profile, accompanied by paleas; rachilla terminating in a little clavate appendage[4. gayana](#)
- 5 Spikelets (1-)2-awned:6
 Spikelets 3–6-awned:7
- 6 Lemma nearly glabrous; leaf-blades abruptly narrowed to a sub-acute point[5. pycnothrix](#)
 Lemma long pilose on margins above (hairs 2 mm. long); leaf-blades gradually tapering to an acute point[6. virgata](#)
- 7 Spikelets 3-awned, awns 5–7 mm. long; fertile lemma acute, ciliate towards apex (hairs 2 mm. long), without glands; sterile florets truncate[7. barbata](#)
 Spikelets 4–6-awned; fertile lemma lanceolate, shortly ciliate above, with a row of glands down each side[8. prieurii](#)

1. **Chloris lamproparia** Stapf in Mém. Soc. Bot. Fr. 2, 8: 220 (1912); Chev. Bot. 746, and in Rev. Bot. Appliq. 14: 126.

APD: *Synonym of Stapfochloa lamproparia* (Stapf) H. Scholz

Tufted annual 30–60 cm. high; **on dry bare soils.**

Mali: Baguirmi Chev. 9653 bis! Bore (Aug.) Demange 14/1957! **U. Volta:** Ouagadougou (Aug.) Chev. 24674! **N. Nig.:** Garin Basan (Aug.) De Leeuw 1103! Damaturu (Aug.) De Leeuw 1097a! Zaria Taylor 7! Samaru, Zaria (Aug.) Sawyer K13! Dan Tashi (Aug.) Hall 315!

Also in the **Sudan** and **E. Africa** (See Useful Plants.)

2. **Chloris robusta** Stapf l.c. 221 (1912); A. Chev. in Rev. Bot. Appliq. 14: 127; Berhaut, Fl. Sén. ed. 2, 398. **APD acc**

Robust perennial 1–2 m. high, with glaucous leaves and with the culms often thick and woody below; **in sandy river beds.**

S. L.: Mafindo Falls, Kailahun (Feb.) Deighton 4004! **Iv. C.:** Marabadiassa (Dec.) Adjanohoun 178a! Aké Assi 7178! Bouna (Oct.) Rose Innes GC 31553! Sanlo to Kakpin (Nov.) Also in **Cape Verde Is.**, **Arabia**, **Sudan** and **S.W. Africa**.

1. **Chloris subtriflora** Steud. Syn. Pl. Glum. 1: 208 (1854).

Senegambia Leprieur.

The description fits *C. pilosa*, but the number of spikes (15) is higher than usual.

2. **Chloris parva** Mimeur in Bull. Mus. Hiatt. Nat. sér. 2, 22: 128 (1950). Senegal Talmy 86.

From the description this species appears to be the same as *C. prieurii*; the type is missing.

52. CHRYSOCHLOA

Swallen in Proc. Biol. Soc. Wash. 54: 44 (1941).

- 1 Stoloniferous, or sometimes caespitose, annual or perennial; leaf-blades 1–15 cm. long and up to 5 mm. broad, rounded at the tip; spikes 2–10; spikelets 3–4 mm. long, laterally compressed and keeled; lower lemma long ciliate on margins and keel, shortly awned from below the tip [hindsii](#)

Chrysochloa hindsii C. E. Hubbard in Kew Bull. 4: 349 (1949). *APD acc*

Chrysochloa annua C. E. Hubbard in Kew Bull. 12: 59 (1957).

Chrysochloa caespitosa W. D. Clayton in Kew Bull. 14: 239 (1960).

Chrysochloa subaequiluma of Berhaut, Fl. Sén. ed. 2, 398, not of (Rendle) Swallen.

Bracteola subaequiluma of A. Chev. in Rev. Bot. Appliq. 14: 127 (1934), and of F.W.T.A., ed. 1, 2: 522, not of (Rendle) C. E. Hubbard.

Culms 10–75 cm. high, the habit very variable; seasonally flooded shallow pans and clayey soils.

59. SPOROBOLUS

R. Br., Prod. 169 (1810).

- 1 Branches of the inflorescence verticillate, sometimes merely subverticillate but then the spikelets almost black; panicle open: **2**
Branches of the inflorescence not whorled; spikelets never almost black: **11**
2 Perennials: **3**
Annuals; leaf-blades conspicuously pectinate-ciliate on the margins: **7**
3 Panicle linear or narrowly lanceolate, usually 20–40 cm. long, of 10–20 whorls; spikelets subsessile along the primary branches: **4**
Panicle pyramidal, ovate, up to about 15 cm. long: **5**
4 Spikelets 2–2.2 mm. long; branches 1–2 cm. long, arcuate, incurved, successive whorls not usually overlapping though sometimes with a few of the lowest branches longer and straggling; leaf-blades flat, up to 7 mm. broad [1. dinklagei](#)
Spikelets 2.7–3 mm. long; branches mostly 1.5–6 cm. long, spreading or ascending, usually longer than the distance between successive whorls; leaf-blades up to 7 mm. broad, but usually much narrower and often involute; spikelets dark reddish in colour [2. sanguineus](#)
5 Spikelets 2–2.2 mm. long; panicle delicate, diffuse, the branches very fine and tinged with red; spikelets grey [3. ioclados](#)
Spikelets 3–4 mm. long, rarely longer, clustered towards the ends of the filiform spreading branches of the

- inflorescence; panicle of 3–4 whorls, sometimes subverticillate:6
- 6 Basal sheaths broad, papery or horny and yellowish; leaf-blades linear, involute, 15–30 cm. long and about 3 mm. broad, sometimes shorter (down to 7 cm.) but then linear-lanceolate and 3–5 mm. broad; spikelets greyish-green, 3–4 mm. long[4. mauritianus](#)
- Basal sheaths more or less fibrous; leaf-blades mostly 2–7 cm. long, involute, about 2 mm. broad; spikelets very dark green, 3–8–4 mm. long or more [5. montanus](#)
- 7 Grain spherical; lower glume half as long as the spikelet:8
- Grain ellipsoid or obovoid, \pm laterally flattened:9
- 8 Grain 0.3–0.6 mm. diam.; spikelets 0.9–1.6 mm. long [6. stolzii](#)
- Grain 0.8–1 mm. diam.; spikelets 1.5–2 mm. long [7. subglobosus](#)
- 9 Lower glume lanceolate, acute to acuminate; spikelets reddish to dark red; panicle lanceolate; stamens 3[8. paniculatus](#)
- Lower glume ovate, obtuse, often \pm suppressed; spikelets greenish or greyish; panicle ovate: 10
- 10 Spikelets 1.6–2 mm. long; anthers 3, 0.7–1.1 mm. long [9. cordofanus](#)
- Spikelets 1–1.2 mm. long; anthers 2, 0.3–0.6 mm. long [10. microprotus](#)
- 11 Inflorescence dense or fairly dense, spike-like or with the spikelets clustered about the whole length of the primary branches; branches and pedicels not capillary: 12
- Inflorescence very delicate and lax, with filiform branches and often very slender pedicels, or with the spikelets clustered at the tips of the branchlets: 21
- 12 Upper glume as long as the spikelet, or almost so: 13
- Upper glume up to 2/3 as long as the spikelet (but if panicle spiciform and leaf-blades pungent see *S. spicatus*): 17
- 13 Plants annual; panicle spiciform, slender, 3–6 mm. broad; leaf-blades flat, or convolute when dry; glumes thin, membranous, acute, the lower 2/3 as long as the spikelet [11. piliferus](#)
- Plants perennial: 14
- 14 Leaf-blades convolute: 15
- Leaf-blades flat, 2–15 cm. long and 2–4 mm. broad, strongly glaucous; glumes acuminate, the lower 4/5 to as long as the spikelet; panicle usually distinctly branched but sometimes subspiciform, 5–20 mm. broad, the branches 5–20 mm. long; culms wiry, 1 mm. diam. [15. helvolus](#)
- 15 Panicle spiciform, the primary branches closely appressed to the rachis; leaf-blades pungent; culms 1–2 mm. diam.: 16
- Panicle distinctly branched, 10–40 mm. broad, the primary branches 20–50 mm. long and \pm spreading; leaf-blades 10–20 cm. long, tapering to a filiform tip (rarely with the culm-leaves flat and up to 7 mm. broad in the most robust specimens); culms 2–3 mm. diam. at the base; glumes acute, the lower typically 4/5 as long as the spikelet, but rather variable [14. robustus](#)
- 16 Lower glume 1/4–1/3 as long as the spikelet, hyaline, nerveless; panicle slender, 2–4 mm. broad, the primary branches 1–5 mm. long [12. spicatus](#)
- Lower glume 2/3–4/5 as long as the spikelet, chartaceous, 1-nerved; panicle usually 6–7 mm. broad, the primary branches 5–15 mm. long; leaf-blades 2–10 cm. long [13. virginicus](#)
- 17 Spikelets markedly acuminate, 1.7–2 mm. long; lower glume a tiny hyaline scale; upper glume abruptly acuminate to a short awn-point up to 0.5 mm. long; palea 1/2–2/3 as long as the lemma; panicle branches 5–25 mm. long [16. molleri](#)
- Spikelets not acuminate: 18
- 18 Panicle pyramidal, 3–4 cm. long, the spikelets clustered at the ends of the branches; grain ellipsoid [17. tourneuxii](#)
- Panicle linear, 10–40 cm. long, open or contracted, the spikelets not clustered; grain truncate: 19
- 19 Upper glume obtuse, 1/4–1/3 as long as the spikelet; basal leaf-sheaths narrow; panicle not spiciform [18. pyramidalis](#)
- Upper glume acute, 1/2–2/3 as long as the spikelet: 20
- 20 Panicle lax with spreading branches; basal leaf-sheaths breaking into fibres at maturity [19. pellucidus](#)
- Panicle narrow to subspiciform, the branches appressed and mostly 1–2 cm. long; basal leaf-sheaths broad and membranous [20. africanus](#)
- 21 Perennials: 22
- Annuals: 26
- 22 Inflorescence with long fine white hairs from the axils of the branches; spikelets 2–2.5 mm. long; glumes acuminate, both 2/3 as long as the spikelet; rhachilla produced for about 1 mm. above the base of the floret [21.](#)

subtilis

- Inflorescence not hairy in the axils; rhachilla not produced: 23
- 23 Spikelets clustered at the tips of the branchlets, 1.5–2.1 mm. long; upper glume 2/3–4/5 as long as the spikelet, acute; basal sheaths fibrous or somewhat indurated *22. nervosus*
- Spikelets borne in a diffuse panicle: 24
- 24 Base fibrous, the fibres woolly tomentose within; spikelets 1.4–2.1 mm. long; upper glume acute *23. stapfianus*
- Base ± fibrous, but never woolly: 25
- 25 Upper glume acute; spikelets 1–1.5 mm. long *24. festivus*
- Upper glume mucronate, abruptly acuminate, or with the single nerve excurrent; spikelets 1.6–2.6 mm. long *25. myrianthus*
- 26 Spikelets 2–3 mm. long; inflorescence of 10–20 spikelets, more or less racemose on the main axis, or the lowest paired; glumes subequal, about 1/2 as long as the spikelet; grain ovoid-elliptic *26. pauciflorus*
- Spikelets at most 2 mm. long; inflorescence a branching panicle with numerous spikelets: 27
- 27 Upper glume cuspidate-acuminate, the central nerve excurrent; lower glume small (0.1–0.2 mm. in our area); spikelet 0.8–1.2(–2) mm. long; grain elliptic; leaf-blades seldom over 6 cm. long *27. pectinellus*
- Upper glume subacute to acute: 28
- 28 Spikelets 1.3–1.7 mm. long (exceptionally 0.8–2 mm.); grain elliptic; leaf-blades mostly 1–5 cm. long; panicle 2–12 cm. long *28. infirmus*
- Spikelets 0.8–1 mm. long; grain obovoid, truncate; leaf-blades mostly 10–20 cm. long; panicle 10–40 cm. long *29. tenuissimus*

1. **Sporobolus dinklagei** Mez in Fedde Rep. 17: 298 (1921); A. Chev. in Rev. Bot. Appliq. 14: 112. *APD acc*

Caespitose perennial 5–10 cm. high; **sandy soils and roadsides.**

S. L.: Freetown (Sept.) Deighton 2003! Ronietta (Nov.) Thomas 5369! Njala (Oct.) Deighton 1420! Gbap (Oct.) Jordan 610! Sembehun (Oct.) Jordan 626! **Lib.:** Monrovia (Nov.) Barker 1454! Buchanan (Nov.) Adam 15996! Tawata (Nov.) Baldwin 10324! Sanokwele (Nov.) Harley 1617! Webo, Nyaake (June) Baldwin 6155! **Iv. C.:** Moossou (Nov.) Adjanohoun 453a!

Closely allied to *S. sanguineus*, with which it intergrades.

2. **Sporobolus sanguineus** Rendle Cat. Welw. 2: 209 (1899). *APD acc*

Sporobolus oxylepis Mez in Fedde Rep. 17: 298 (1921); F.W.T.A., ed. 1, 2: 527.

Sporobolus marginatus of F.W.T.A., ed. 1, 2: 527.

Sporobolus schweinfurthii Stapf (1908).

Sporobolus rhodesiensis Stent & Rattray (1933).

Sporobolus schliebenii Pilger (1932).

Tufted perennial about 60 cm. high; **pockets and crevices in rock outcrops (in southern Africa it occurs on deeper soils in Brachystegia woodland).**

Guin.: Dalaba (Oct.) Adam 12582! **Iv. C.:** Mont Mafa (Nov.) Aké Assi 10367! Séguélo (Oct.) Aké Assi 6601! Samatigela (Oct.) Boudet 3324! **Ghana:** Damongo Scarp (Sept.) Rose Innes GC 30207! Throughout tropical Africa.

[Exceedingly variable in inflorescence characters, but apparently without sufficient correlation between these characters to justify the recognition of more than one species. The variation in spikelet length is much greater (2–3.5 mm.) in southern Africa.]

3. **Sporobolus ioclados** Nees Fl. Afr. Austr. 161 (1841). *APD acc*

APD: **Synonym of *Sporobolus nervosus* Hochst.**

Sporobolus marginatus Hochst. ex A. Rich., Tent. Fl. Abyss. 2: 397 (1851); A. Chev. in Rev. Bot. Appliq. 14: 113; Berhaut, Fl. Sén. ed. 2, 412.

Vilfa marginata (Hochst. ex A. Rich.) Steud. (1854).

V. pallida Nees ex Trin. (1840).

Sporobolus pallidus (Nees ex Trin.) Boiss. (1884), not of Lindl. (1848).

Sporobolus laetevirens Coss. (1889).

Caespitose perennial 30–60 cm. high; **seasonally moist, usually alkaline, soils in dry regions.**

Maur.: Néma Rossetti 61/167! **Mali:** Toguère of Sarédina (May) Davey 87! Goumbomba, Koubita (Dec.) Davey 26! Dogo (Apr.) Davey 560! Banguita (Sept.) Farrow 9! **Niger:** Zinder to Médik (Aug.) P. de Fabrègues 2031!

Throughout Africa, and in **India**.

4. *Sporobolus mauritanus* (Steud.) Dur. & Schinz Consp. Fl. Afr. 5: 822 (1894).

APD: *Synonym of Sporobolus subulatus Hack.*

APD: *Synonym of Sporobolus rigidifolius (Trin.) Mez ex Veldkamp*

Vilfa mauritiana Steud., Syn. Pl. Glum. 1: 157 (1854).

Sporobolus ledermonnii Mez in Fedde Rep. 17: 296 (1921).

Sporobolus hubbardii A. Chev. in Bull. Mus. Hist. Mat. sér. 2, 20: 469 (1948), and in Rev. Bot. Appliq. 29: 126.

Densely caespitose perennial, 30–60 cm. high.

Guin.: Diédédou to Niassomoridou (Feb.) Chev. 20855! Macenta (Jan., Apr.) Jac.-Fél. 1590! Adam 3359! 3644! 4249! **S. L.:** Mt. Loma (Jan., Feb., June) Jaeger 9161! 9391! 9774! Tingi Mts (Apr., Dec.) Tropical and S. Africa, extending to Yemen, Madagascar and Mauritius. (See Useful Plants.)

Note. Robust plants typical of *S. pyramidalis* do not occur in tropical America, and the smaller local species has therefore been regarded as distinct and named *S. jacquemontii*. Identical plants are found in West Africa, suggesting the introduction of the American species. Unfortunately it intergrades with depauperate specimens of *S. pyramidalis*, so that in Africa the two species are doubtfully separable: -

S. pyramidalis

S. jacquemontii

Culms 1–2 mm. diam. at base, usually 50–70 cm. high; leaf-blades 1.5–2.6 mm. broad; panicle branches loosely appressed to the main axis, the lower 3–4 cm. long; grain 1–1.1 mm. long, obovoid-elliptic, slightly truncate at the top

Culms 2–6 mm. diam. at base, usually 90–160 cm. high; leaf-blades 3–10 mm. broad; panicle branches spreading horizontally at anthesis, the lower mostly 5–10 cm. long; grain 0.8–1 mm. long, obovoid, strongly truncate (see above)

[**Sporobolus jacquemontii** *Kunth* Rev. Gram. 2: 427 (1831); Clayton in Kew Bull. 19: 288.

APD: Synonym of Sporobolus pyramidalis P. Beauv.

Vilfa jacquemontii (*Kunth*) *Trin.* (1840).

Sporobolus pyramidalis var. **jacquemontii** (*Kunth*) *Jov. & Guéd.* in Bull. Cent Stud. Rech. Sci., Biarritz 7: 60 (1968), invalidly published.

South Africa, extending northwards into the highlands of tropical Africa; also in **Mauritius**, **Ceylon**, **Australia**, **New Zealand**, **Hawaii** and, **Easter Island**.

[Some intermediate specimens (such as Bumpus 16 from Bambui) have a long acute upper glume, but a spreading, pyramidal panicle. They have been described as *S. natalensis* (Steud.) Dur. & Schinz (1894) and *S. indicus* var. *laxus* (Nees) Stapf (1900), and may be of hybrid origin.]

21. **Sporobolus subtilis** *Kunth* Rev. Gram. 2: 421 (1831); A. Chev. in Rev. Bot. Appliq. 14: 115. *APD acc*

Vilfa subtilis (*Kunth*) *Trin.* in Mém. Acad. Sci. Petersb. sér. 6, 2: 88 (1840).

Sporobolus barbigerus *Franch.* in Bull. Soc. Hist. Nat. Autun 8: 371 (1895).

Densely tufted perennial 30–46 cm. high, with coarsely fibrous base.

S. L.: Mt. Loma (Feb.) Jaeger 9400! 9419! Tingi Mts. Morton & Gledhill SL 3060! **Lib.:** Monrovia (June, Aug.) Baldwin 5918! 9194! Paynesville (Feb.–Mar.) Harley 2117! Voorhoeve 862b! Duport (Oct.) Barker 1445! **S. Nig.:** Obudu Plateau (Feb., Apr.) Tuley 483! Haines 359!

Extends through the Congo and Tanzania to Zambia, Rhodesia, **Angola**, Mozambique and S. Africa; also in **Madagascar**.

22. *Sporobolus nervosus* Hochst. in Flora 38: 202 (1855). *APD acc*

Sporobolus longibrachiatus Stapf in Kew Bull. 1907: 219 (1907).

Tufted perennial 15–60 cm. high.

Maur.: Nouakchott (Oct.) Adam 21775!

Ethiopia to Tanzania, and in **S.W. Africa**.

23. *Sporobolus stapfianus* Gandoger in Bull. Soc. Bot. Fr. 66: 302 (1920); De Miré & Gillet in J. Agric. Trop. 3: 736. *APD acc*

Sporobolus festivus var. *stuppeus* Stapf in Fl. Capensis 7: 582 (1900).

Sporobolus stuppeus (Stapf) Stent in Bothalia 2: 264 (1927).

Very similar to the following, but with a less delicate inflorescence.

N. Nig.: Zaranda Mt. (May) Lely 196!

Tropical and S. Africa generally.

24. *Sporobolus festivus* Hochst. ex A. Rich. Tent. Fl. Abyss. 2: 398 (1850); Chev. Bot. 742, and in Rev. Bot. Appliq. 14: 112 (incl. var. *fibrosus* Stapf ex Stent in Bothalia 2: 264 (1927)); Berhaut, Fl. Sén. ed. 2, 412. *APD acc*

Vilfa festiva (Hochst. ex A. Rich.) Steud., Syn. Pl. Glum. 1: 158 (1854).

Densely tufted perennial up to 60 cm. high, with strongly fibrous base and very delicate, often reddish, inflorescence; **crevices and hollows in rock outcrops and shallow soils**.

Maur.: Néma Rossetti 61/190! **Gam.:** Saunders 51! Genieri to Massambe (July) Fox 172! **Mali:** Kersani (Aug.) Farrow 75! Dioura (Sept.) Farrow 74! **Guin.:** Tambailo (Aug.) Adam 14838! **Iv. Also in the **C. African Rep.**, **Congo** and **Uganda**.

29. *Sporobolus tenuissimus* (Schränk) O. Ktze. Rev. Gen. Pl. 3: 369 (1893). *APD acc*

Panicum tenuissimum Schrank in Denkschr. Bot. Ges. Regensb. 2: 26 (1822).

Vilfa minutiflora Trin., Diss. Bot. 158 (1824).

Sporobolus minutiflorus (Trin.) Link, Hort. Berol. 1: 88 (1827); F.W.T.A., ed. 1, 2: 527; Berhaut, Fl. Sén. ed. 2, 412.

Sporobolus bibansiensis Vanderyst (1920), in synonymy.

Annual 30–90 cm. high.

Sen.: Dakar (May) Baldwin 5726! Sangalkam (June) Raynal 5958! **Guin.:** Conakry (Jan., June) Dalz. 8418! 8419! Martine 6! **Lib.:** Nimba (Sept., Dec.) Adam 20282! Adames 544! **S. Nig.:** Boughey GC 11400! Lagos (Oct.) Haines 180! **F. Po:** Santa Isabel Swarbrick 2910!

Occurs in **Gabon**, **Kenya** and **Tanzania**, extending eastwards through **Arabia** and Mauritius to India; also in **tropical America**.

60. CRYPSIS

Ait., Hort. Kew. 1: 48 (1789); C. E. Hubbard in Hook., Ic. Pl. 35: t. 3457 (1947); Lorch in Bull. Res. Counc. Israel 11D: 91 (1962); nom. cons.

- 1 Inflorescence an ovoid head of densely crowded spikelets, up to 2 cm. long and 0.8 cm. broad, embraced below by two inflated leaf-sheaths; spikelets 2.5–4 mm. long; glumes shortly ciliate on the keel *schoenoides*

Crypsis schoenoides (Linn.) Lam. Tab. Encycl. Méth. Bot. 1: 166 (1791); Lebrun in Bull. Soc. Bot. Fr. 166: 258 (1969). *APD acc*

Phleum schoenoides Linn., Sp. Pl. 60 (1753).

Heleochloa schoenoides (Linn.) Host (1801)—F.W.T.A., ed. 1, 2: 530.

Crypsis compacta Steud., Syn. Pl. Glum. 1: 151 (1854).

Annual, with prostrate stems radiating from the root.

Sen.: Leprieur! Roger 31!

Extends northwards into Mediterranean Europe, and eastwards through **Ethiopia** and the Middle East to N.W. India; isolated records southwards to Malawi.

61. PEROTIS

Ait., Hort. Kew. 1: 85 (1789).

- 1 Base of spikelets abruptly rounded, without a definite callus; spikelets 1.7–2.7 mm. long, crowded, usually spreading; awns 9–17 mm. long [1. patens](#)
- Base of spikelets drawn out into a distinct stipitiform callus: **2**
- 2 Spikelets 1.5–2.5 mm. long (excl. callus); awns 5–15 mm. long; glumes, and their slender mid-nerve, uniformly scaberulous or hispidulous; grain terete [2. indica](#)
- Spikelets 2.5–3.5 mm. long: **3**
- 3 Spike lax, the spikelets distant by several times their own width; mid-nerve of upper glume depressed and spinulose; glumes irregularly hispidulous; awn 5–15 mm. long; grain strongly flattened [3. hildebrandtii](#)
- Spike dense, the spikelets contiguous; mid-nerve of upper glume neither depressed nor markedly spinulose; glumes hispidulous in lines along their length; awn 20–35 mm. long; grain slightly flattened [4. scabra](#)

1. *Perotis patens* *Gandoger* in Bull. So Bot. Fr. 66: 301 (1920). *APD acc*

Perotis transvaalensis *Gandoger* l.c. (1920).

Glaucous annual or short-lived perennial up to 60 cm. high, with dense spikes; [roadsides and weedy places](#).

Oyo, Fashola Thorold 4!

Also in **Kenya**, **Tanzania**, and the **Seychelles**.

4. *Perotis scabra* Willd. ex Trin. Gram. Unifl. 172 (1824). *APD acc*

Annual up to about 60 cm. high, decumbent at the base; [roadsides and lawns](#).

Sen.: (Sept.) Farmer 72! Heudelot 650! M’bao (Nov.) I.F.A.N.! **Gam.:** (July) Brooks 3! **S. L.:** Mambolo, Kichom (Oct.) Glanville 425! Pamaro (Nov.) T. S. Junes 44!

62. TRAGUS

Haller, Hist. Stirp. Helv. 2: 203 (1768); *Schweickerdt* in Ann. Natal Mus. 10: 15 (1941); nom. cons.

- 1 Upper glume of lowermost spikelet of each cluster 7-nerved, 3.5–5 mm. long; clusters composed of 2–4 fertile spikelets and 1–2 reduced sterile spikelets; anthers 0.6–0.8 mm. long *1. racemosus*
 Upper glume of lowermost spikelet of each cluster 5-nerved, 2–3 mm. long; clusters composed, of 2 spikelets, the upper smaller and borne upon a short internode; anthers 0.4–0.6 mm. long *2. berteronianus*

1. **Tragus racemosus** (*Linn.*) *All.* Fl. Ped. 2: 241 (1785); *Chev.* Bot. 721, and in *Rev. Bot. Appliq.* 14: 110; *Berhaut* Fl. Sén. ed. 2, 389, 393; *De Miré & Gillet* in *J. Agric. Trop.* 3: 737. *APD acc*

Cenchrus racemosus *Linn.*, Sp. Pl. 1049 (1753).

Tragus decipiens (*Fig. & De Not.*) *Boiss.* (1884).

Tragus paucispina *Hack.* (1901).

Tragus racemosus var. *erectus* *Mut.* (1837),

Tragus racemosus var. *decipiens* (*Fig. & De Not.*) *Dur. & Schinz* (1894),

Tragus racemosus var. *paucispina* (*Hack.*) *Maire* (1941).

Annual, up to about 30 cm. high; roadsides and waste places on dry sandy soils.

Maur.: Atar (Sept.) Kesby 41! **Mali:** Sahel Canal Leclercq 42757!

Southern Europe, **N. Africa** and **C. African Rep.**, extending through **Ethiopia** and Somaliland into **Arabia**; also in **S. Africa**.

2. **Tragus berteronianus** *Schult.* Mant. 2: 205 (1824); *Lebrun* in Bull. Soc. Bot. Fr. 116: 266 (1969). *APD acc*

Tragus racemosus var. *berteronianus* (*Schult.*) *Hack.* in *Osterr. Bot. Zeit.* 51: 195 (1901).

Tragus ciliatus *Leprieur ex Kunth*, *Rev. Gram.* 2: 413 (1831), in synonym.

Lappago racemosa var. *erecta* *Kunth*, *Rev. Gram.* 2: 413, t. 120 (1831).

Mali: Oualata (July, Aug.) Boëry! Goundam (Aug.) Chev. 2334! Timbuktu (July, Aug.) Hagerup 172! Lean 74! **U. Volta:** Gourma (Aug.) Rossetti 93/1959!

Throughout Africa and the warmer parts of America; also in **Arabia**, **Afghanistan** and **China**.

63. LEPTOTHRIUM

Kunth, *Rev. Gram.* 1: 156 (1829). *Latipes* *Kunth*, *Rev. Gram.* 1: 261 (1830).

- 1 Leaf-blades linear, flat or rolled, 2–10 cm. long; inflorescence up to 15 cm. long or more, the rachis tough and wavy; spikelets single or paired, often purplish, 3–5.5 mm. long, persistent on hard flattened cuneate peduncles and falling with them; one glume in each cluster drawn out into a recurved flattened tail up to 8 mm. long and ciliate with hooked hairs; other glumes thickened and tuberculate-spinulose on the back *senegalense*

- Leptothrium senegalense** (*Kunth*) *W. D. Clayton* in *Kew Bull.* ined. (1972). *APD acc*

Latipes senegalensis *Kunth*, *Rev. Gram.* 1: 261 (1830); *F.W.T.A.*, ed. 1, 2: 537; *Chev.* Bot. 722, and in *Rev. Bot. Appliq.* 14: 111; *Berhaut*, Fl. Sén. ed. 2, 389; *De Miré & Gillet* in *J. Agric. Trop.* 3: 734.

Lappago latipes *Steud.* (1854).

Tragus senegalensis *Gay ex Kunth*, in synonym. (1830).

Perennial, forming tough wiry bunches on dry soils.

Maur.: Tagent Coll. Admin. 3473! **Sen.:** (Nov.) Roger 19! Heudelot 494! **Mali:** Goundam (Aug.) Chev. 2331! Bandiagara to Douentza (July) Rogeon 449! Timbuktu (July, Aug.) Hagerup 206! Lean! Oualata (Sept., Oct.) Boëry! **Ghana:** Prampram (Feb.) Darko 559!

Also in E. Africa from **Egypt** to Tanzania, extending through **Arabia** to Persia and Pakistan.

- Zoysia matrella** (*Linn.*) *Merr.* *APD acc*

Widely used as a lawn grass in tropical Asia, has been introduced to Ife, Nigeria for the same purpose.

Additional genus

Zoysia tenuifolia Trin. APD acc

Has been used for lawns in Lomé, Togo (Charter FHI 40822!).

A finer leaved species (than *Zoysia matrella*), from Korea & Japan.

Additional genus

64. TRISTACHYA

Nees, Agrost. Bras. 458 (1829); F.T.A. 10: 52 (1937); C. E. Hubbard in Kew Bull. 1936: 321; Conert in Engl., Bot. Jahrb. 77: 296 (1957); Phipps in Kirkia 4: 101 (1964); Clayton in Kew Bull. 21: 120 (1967).

- 1 Pedicels connate; triads in a narrow raceme, with short erect peduncles; lower glume beset with tubercle-based hairs [1. thollonii](#)
 Pedicels free, up to 6 cm. long; spikelets in a narrow panicle; lower glume glabrous [2. superba](#)

1. Tristachya thollonii Franch. in Bull. Soc. Hist. Nat. Autun 8: 374 (1895); F.T.A. 10: 62; Conert l.c. 306. APD acc

Apochaete thollonii (Franch.) Phipps l.c. 105 (1964).

Tufted perennial up to 1·2 m. high; **seasonally damp soils.**

N. Nig.: Shika, Zaria (Oct.) Magaji 1631! Abinsi (Dec.) Dalz. 882! 886!

Also extends from the Congo to Zambia and Malawi.

2. Tristachya superba (De Not.) Schweinf. & Aschers. Beitr. Fl. Aethiop. 302 (1867); Conert l.c. 299; Phipps l.c. 102. APD acc

Loudetia superba De Not. in Ind. Sem. Hort. Genuens. 24 (1852) & in Ann. Sci. Nat. sér. 3, 19: 369 (1853); F.T.A. 10: 47; Berhaut, Fl. Sén. ed. 2, 416.

Stout perennial 1·5–3·5 m. high; base of culm swollen and clad in silky hairy leaf-sheaths.

Mali: Bamako (Sept.) Adam 15353! Sikasso (Sept.) Adam 15049! **U. Volta:** Takalédougou, Banfora (Sept.) Aké Assi 6316! Samandeni, Bobo-Dioulasso (Oct.) Kmoch 138! **Ghana:** Yapei Ferry, White Volta R. (Aug.) Rose Innes GC 31992! Tamale to Yendi (Sept.) Rose Innes GC 30451! Kulpeni R., Yendi Hinds 8! Daka R., Yendi (Nov.) Addei SLUS 734! Damongo scarp (Sept.) Hall CC 841! **N. Nig.:** Michika, Bornu (Aug.) De Leeuw 1814! Mando F.R., Birnin Gwari Dist. (Sept.) Keay FHI 28032! Gombe to Bauchi (Dec.) Oche 96! Yankari Game Reserve (Sept.) Oche & Tuley 1693!

Extends through tropical Africa.

[Although *Loudetia* was not properly described until 1854, the epithet *superba* was validly described in combination with the earlier illegitimate generic name.]

65. ARUNDINELLA

Raddi, Agrost. Bras. 37, t. 1, fig. 3 (1823); F.T.A. 10: 1 (1937); Hubbard in Kew Bull. 1936: 319; Conert in Engl., Bot. Jahrb. 77: 329 (1967); Phipps in Kirkia 4: 97 (1964) and in Can. J. Bot. 45: 1047 (1967); Clayton in Kew Bull. 21: 121 (1967). **APD acc**

- 1 Perennial up to 3 m. high; culms hard; leaf-blades stiff, linear; panicle oblong, 30–50 cm. long, the spikelets arising singly or in pairs from the primary branches, rarely from secondary branches; spikelets 4·5–5·5 mm. long [1. nepalensis](#)
 Annual; culms soft; leaf-blades flaccid, narrowly lanceolate; panicle effuse, obovate; up to 25 cm. long; spikelets 1·5–2·5 mm. long [2. pumila](#)

1. Arundinella nepalensis Trin. Gram. Panic. 62 (1826). APD acc

Arundinella ecklonii Nees (1841), incl. var. major C. E. Hubbard (1934); F.T.A. 10: 2; F.W.T.A., ed. 1, 2: 546; A. Chev. in Rev. Bot. Appliq. 14: 42; Berhaut, Fl. Sén. ed. 2, 417.

An extremely variable grass, the culms 0.6–3.5 m. high, and the panicles 10–50 cm. long, but with the spikelets relatively constant; the West African specimens fall into the upper part of this range.

Sen.: Niokolo-Koba (Feb., Apr., Oct.) Berhaut 1596! Adam 15714! 17437! **Mali:** Marigot Farako (Feb.) Duong 2102!

Guin.: Labé to Mali (Nov.) Chev. 34593! Mali to Mt. Laura Chev. 34601 bis !

Tropical and South Africa, extending through India to China and Australia.

2. *Arundinella pumila* (Hochst. ex A. Rich.) Steud. Syn. Pl. Glum. 1: 114 (1854); F.T.A. 10: 3; Conert in Engl., Bot. Jahrb. 77: 340; Bor in J. Ind. Bot. Soc. 27: 62. *APD acc*

Acratherum pumilum Hochst. ex A. Rich., Tent. Fl. Abyss. 2: 414 (1851).

Arundinella effusa C. E. Hubbard in Kew Bull. 12: 63 (1857).

Guin.: Mali Jac.-Fél. 1988! Massif du Benna (Oct.) Jac.-Fél. 7163! Kindia (Jan.) Chillou 1806! Ditinn (Apr.) Pitot! **S. L.:** Tingi Mts., Kono (Dec.) Morton & Gledhill SL 2930! **Ghana:** Boti Falls, Huhunya (Oct.) Hall 1619! **N. Nig.:** Wana, Lafia (Nov.) Hepburn 157! **W. Cam.:** Metschum R. Falls, Bamenda (Jan.) Keay & Russell FHI 28524!

Also in NE. Africa, extending through India to Indonesia.

66. LOUDETIOPSIS

Conert in Engl., Bot. Jahrb. 77: 277 (1957); Clayton in Kew Bull. 21: 122 (1967).

- 1 Lobes of upper lemma awned, with a tuft of hairs below each lobe; stamens 3:2
Lobes of upper lemma awnless, the lemma uniformly hairy or glabrous on the back; stamens usually 2:4
- 2 Pedicels 5–25 mm. long, the spikelets in loose groups of 2 or 3; spikelets 6–10 mm. long[1. occidentalis](#)
Pedicels 0.5–1 mm. long, the spikelets in close clusters of 3:3
- 3 Annual; spikelets 5 mm. long; lower glume 3–3.5 mm. long; panicle dense, of 40 or more triads ...[2. pobeguinii](#)
Perennial; spikelets 6–12 mm. long; lower glume 4–11 mm. long; panicle loose, of 4–35 triads [3. tristachyoides](#)
- 4 Annual; spikelets 14–17 mm. long with, or rarely without, pale yellow tubercle-based hairs; callus of upper floret 2-toothed; awns 7–12 cm. long[4. kerstingii](#)
Perennials:5
- 5 Awns 4.5–7 cm. long:6
Awns 0.3–3 cm. long:7
- 6 Callus of upper floret obliquely 1-toothed or truncate; spikelets 13–20 mm. long; lower glume 8–13 mm. long, narrowly lanceolate, tapering to an acute or acuminate tip, the lateral nerves encrusted with a continuous line of tubercles; peduncle sharply recurved[5. chrysothrix](#)
Callus of upper floret 2-toothed; spikelets 9–13 mm. long; lower glume 5–8 mm. long, lanceolate, narrowing to an obtuse tip, the lateral nerves usually with isolated tubercles, rarely glabrous; peduncle straight or flexuous, rarely recurved[6. scaëtae](#)
- 7 Peduncles sinuous or sharply recurved, and densely hairy beneath the triads:8
Peduncles straight or almost so, and glabrous beneath triads (though sometimes with hairy pedicels): 10
- 8 Awns 20–30 mm. long; spikelets 6–7 mm. long; leaf-blades setaceous, involute, up to 1 mm. broad; panicle branches pilose to villous; lower lemma 3-nerved; stamens 2 [7. capillipes](#)
Awns 3–5 mm. long; triads deciduous as a whole; lower lemma 7-nerved; stamens 3:9
- 9 Column of awn lacking; upper lemma sparsely pubescent, with an oblong truncate callus[8. baldwinii](#)
Column of awn 1.5 mm. long, twisted; upper lemma densely pilose, with a very short rounded callus [9. falcipes](#)
- 10 Lower glume 3/4 to almost as long as the upper; glumes glabrous or with a few tubercle-based hairs; lower lemma 5–9-nerved; stamens 3 [10. trigemina](#)
Lower glume 1/2–2/3 as long as upper; stamens 2: 11
- 11 Basal leaf-sheaths tomentose below; glumes and pedicels glabrous, or the lower glume pubescent towards the apex; lower glume acute to acuminate; lower lemma 3–5-nerved [11. glabrata](#)
Basal leaf-sheaths glabrous below; glumes and pedicels usually setose with tubercle-based hairs; lower lemma 3-nerved: 12

- 12** Culm glabrous and smooth below panicle; panicle contracted and rather dense, 2.5–11 cm. broad, branches erect or ascending; lower glume obtuse to sub-acute [12. *ambiens*](#)
- Culm scabrid and rough to the touch below panicle; panicle open and very loose, 6–25 cm. broad, branches widely spreading and often conspicuously whorled; lower glume truncate to obtuse [13. *thoroldii*](#)

1. *Loudetiopsis occidentalis* (Jac.-Fél.) W. D. Clayton in Kew Bull. 21: 123 (1967). *APD acc*

Dilophotriche occidentalis Jac.-Fél. in J. Agric. Trop. 7: 408 (1960).

Danthoniopsis occidentalis Jac.-Fél. in Rev. Bot. Appliq. 30: 424 (1950), without latin descr.

Perennial, 60–90 cm. high.

Guin.: Conakry (Dec.) Adam 12617! Kindia Jac.-Fél. 1852! Friguiagbé (Sept.–Dec.) Chillou 25! 105! Kanea (Oct.) Adam 12630!

(The tufts of hair on the upper lemma are lacking in this specimen).

2. *Loudetiopsis pobeguinii* (Jac.-Fél.) W. D. Clayton in Kew Bull. 21: 123 (1967). *APD acc*

Dilophotriche nobeguinii Jac.-Fél. in J. Agric. Trop. 7: 408 (1960).

Danthoniopsis pobeguinii Jac.-Fél. in Rev. Bot. Appliq. 30: 423 (1950), without latin descr.

About 60 cm. high; **moist places**.

Sen.: Niokolo-Koba (Jan.) Berhaut 4672! Kanéméré (Aug.) Fotius 369 ter (fide Lebrun in Bull. Soc. Bot. Fr. 116: 263 (1969)). **Port. G.:** Madina de Boé, Gabú (Dec.) Esp. Santo 2848! **Guin.:** Seriba to Kiffaya (Oct.) Adam 12703! Touba to Kadé (June) Pobéguin 2035!

67. LOUDETIA

Hochst. ex Steud., Syn. Pl. Glum. 1: 238 (1854); A. Br. in Flora 24: 713 (1841), nom. superfl.; F.T.A. 10: 12 (1937); C. E. Hubbard in Kew Bull. 1936: 319; Conert in Engl., Bot. Jahrb. 77: 247 (1957); Phipps in Kirkia 4: 98 (1964); Clayton in Kew Bull. 21: 122 (1967).

- 1 Spikelets 22–27 mm. long, in groups of 3 on pedicels up to 2 cm. long; lower floret barren and reduced to the 5-nerved lemma; anthers 2, their tips with a minute tuft of hairs; awn 9–20 cm. long; callus unequally 2-toothed [1. togoensis](#)
Spikelets up to 17 mm. long (rarely up to 22 mm.) paired or solitary; lower floret with a palea, the lemma 3-nerved; anther tips glabrous: **2**
- 2 Upper lemma loosely pilose with hairs up to 2 mm. long; leaf-blades up to 1 m. long and 2 cm. broad; panicle 30–60 cm. long, contracted and dense; spikelets 6–7 mm. long; callus of upper floret truncate; awn 12–18 mm. long, including a column 2–3 mm. long [2. phragmitoides](#)
Upper lemma pubescent or glabrescent: **3**
- 3 Annuals; awn 5–12 cm. long; spikelets 14–17 mm. long or rarely longer; lower lemma 1/2–2/3 as long as the spikelet: **4**
Perennials, usually densely tufted; awn up to 5·5 cm. long; lower lemma from 3/4 to as long as the spikelet: ... **5**

- 4 Callus of upper floret with two equal teeth; panicle elliptic or oblong, typically 12–20 cm. long and 3–4 cm. broad (excluding awns) [3. annua](#)
- Callus of upper floret obliquely 1-toothed, pungent, sometimes with a reduced second tooth; panicle linear, contracted, typically 15–30 cm. long and 1–2 cm. broad (excluding awns) [4. hordeiformis](#)
- 5 Panicle very dense and spike-like, up to 15 cm. long and 6–14 mm. broad; branches very short, up to 6 mm. long, 1–4 spiculate; lower leaf-sheaths densely pilose at the base; lower glume narrowly lanceolate, acute, 7 mm. long, dorsally flattened, setulose from a single line of black tubercles along each lateral nerve [5. coarctata](#)
- Panicle loose or contracted but not spike-like, up to 60 cm. long and 15 cm. broad: [6](#)
- 6 Glumes acuminate, tapering to a setaceous tip, glabrous or sparsely pilose with tubercle-based hairs; callus narrowly truncate: [7](#)
- Glumes, especially the lower, obtuse or subacute at the tip; stamens 2: [8](#)
- 7 Culms stout, erect; leaf-blades 20–40 cm. long; panicle dense, containing numerous spikelets; spikelets 8–15 mm. long; awn 2.5–3 cm. long; stamens 3 [6. flavida](#)
- Culms slender, straggling; leaf-blades 2–5 cm. long; panicle scanty, containing up to 15 spikelets; spikelets 8–9 mm. long; awn 1.5–2 cm. long; stamens 2 [7. jaegerana](#)
- 8 Callus of upper floret truncate or slightly emarginate; panicle robust, 20–60 cm. long, the branches conspicuously whorled; leaf-blades 30–70 cm. long and 6–15 mm. broad; basal sheaths silky pubescent but scarcely tomentose; nodes glabrous or bearded [8. arundinacea](#)
- Callus of upper floret 2-toothed: [9](#)
- 9 Upper lemma obscurely 2-lobed, the lobes up to 0.2 mm. long; lower glume subacute, about half as long as the spikelet; basal leaf-sheaths glabrous or at most pubescent; spikelets 8–10 mm. long, always hairy [9. kagerensis](#)
- Upper lemma acutely 2-lobed, the lobes 0.3–1 mm. long; lower glume obtuse, usually about 1/3 as long as the spikelet; basal leaf-sheaths usually woolly tomentose in our area; spikelets 8–14 mm. long, mostly glabrous [10. simplex](#)

Tropical and South Africa.

[A form from Cameroun with large dark brown spikelets has been separated as *L. camerunensis*. These specimens (marked*) are quite distinct in our area, but similar plants occur in East Africa where they merge into the main body of the species. It seems that *L. camerunensis* should be included in *L. simplex*, of which it is merely an extreme variant.—W.D.C.]

68. DANTHONIOPSIS

Stapf in Hook., Ic. Pl. 31: t. 3075 (1916); F.T.A. 10: 73 (1937); Hubbard in Kew Bull. 1936: 319 (1936); Jacques-Félix in Rev. Bot. Appliq. 10: 422 (1950); Conert in Engl., Bot. Jahrb. 77: 317 (1957); Phipps in Kirkia 4: 113 (1964); Clayton in Kew Bull. 21: 121 (1967).

- 1** Lower leaf-sheaths densely and shortly silky-villous at the base; blades broadly linear, up to 60 cm. long and 2 cm. broad; panicle narrowly ovate, about 20 cm. long, loose; spikelets 8–10 mm. long, variegated with purple or brown; glumes glabrous, 3-nerved, the lower ovate, 5–6 mm. long, the upper as long as the spikelet; lower lemma 5-nerved; stamens 3; upper lemma sparsely pilose, with a transverse line of hairs below each lateral lobe; keels of the upper palea narrowly winged throughout; awn 14–16 mm. long, flattened below ..[chevalieri](#)

Danthoniopsis chevalieri A. Camus & C. E. Hubbard in Rev. Bot. Appliq. 14: 780 (1834); F.T.A. 10: 76; A. Chev. in Rev. Bot. Appliq. 14: 44 (1934); Jacques-Félix l.c. 424; Conert l.c. 320; Berhaut, Fl. Sén. ed 2, 417. *APD acc*

Arundinella chevalieri (A. Camus & C. E. Hubbard) Roberty in Bull. I.F.A.N. 17: 55 (1955).

Tufted perennial 1.8–2.7 m. high.

Guin.: Labé to Mali (Nov.) Chev. 34603! Dalaba to Souguéta Chev. 20190! Timbo (Oct.) Pobéguin 1727! Ditinn (Oct.) Pitot! Sériba (Oct.) Pitot! **S. L.:** Serikudi (Nov.) Glanville 313! Musaia (Dec.) Deighton 4523!

69. TRICHOPTERYX

Nees in Lindl., Nat. Syst. ed. 2: 449 (1836); F.T.A. 10: 4; Hubbard in Kew Bull. 1936: 319 (1936); Conert in Engl., Bot. Jahrb. 77: 238 (1957); Phipps in Kirkia 4: 119 (1964); Clayton in Kew Bull. 21: 120 (1967).

1 Annual; culms erect or geniculately ascending; glumes glabrous or bearing stiff tubercle-based hairs [1. elegantula](#)

Perennial; culms wiry and trailing; glumes minutely pubescent [2. marungensis](#)

1. **Trichopteryx elegantula** (*Hook. f.*) *Stapf* in Hook., Ic. Pl. 24: t. 2394 (1895); F.T.A. 10: 11; Conert l.c. 246. *APD acc*

APD: *Synonym of Trichopteryx elegantula (Hook. f.) Stapf*

Arundinella elegantula *Hook. f.* in J. Linn. Soc. 7: 233 (1864).

Trichopteryx glanvillei *C. E. Hubbard* in Kew Bull. 1934: 426; F.T.A. 10: 11; F.W.T.A., ed. 1, 2: 545.

A delicate annual, 5–17 cm. high.

S. L.: Bintumane (Nov., Jan.) Glanville 335! T. S. Jones 100! 147! Morton SL2660! Mt. Loma (Oct.) Jaeger 7861! 8312! **N. Nig.:** Njawai (Nov.) Jackson, Magaji & Tuley 1908! Chappal Waddi (Nov.) Jackson, Magaji & Tuley 2026! **S. Nig.:** Obudu Plateau (Nov.) Tuley 978! **W. Cam.:** Cam. Mt., 6,000–8,500 ft. (Nov., Dec.) Migeod 204! Mann 2092! Bansa to Bamenda (Oct.) Tamajong FHI 23489! L. Bambuluwe (Sept.) Ujor FHI 30209! Bambui Bumpus Bam/11!

South to Malawi and Zambia.

2. **Trichopteryx marungensis** *Chiov.* in Nuovo Giorn. Bot. Ital. n.s. 26: 67 (1919); F.T.A. 10: 9 (1937). *APD acc*

Trichopteryx gracillima *C. E. Hubbard* in Kew Bull. 1934: 425; F.T.A. 10: 8; Phipps l.c. 120; Conert l.c. 243.

Trichopteryx decumbens *C. E. Hubbard* in Kew Bull. 4: 350 (1949); Conert l.c. 244.

Trailing wiry culms 30–60 cm. long; **swampy places.**

N. Nig.: Tugan (Dec.) Daramola FHI 62430! Mayodaga, Mambila Plateau (Apr.) Gbile & Daramola FHI 62892! **W. Cam.:** Kumbo to Oku (Feb.) Hepper & Charter 2019! Nkambe (Feb.) Brunt 991! Mbiami (June) Brunt 751!

Also in **Uganda**, and southwards to Rhodesia.

70. ISACHNE

R. Br., Prodr. Fl. Nov. Holl. 196 (1810); F.T.A. 9: 1090 (1934).

1 Lemmas similar in shape and texture, and more or less in size; florets almost contiguous: [2](#)

Lemmas dissimilar, the lower larger, thinner, glabrous, the upper smaller, minutely hairy; florets separated by a minute rhachilla-joint; spikelets contracted about the primary branches: [4](#)

2 Florets subrotund, indurated; panicle diffuse; leaf-blades linear-lanceolate: [3](#)

Florets elliptic, subacute, thinly coriaceous, usually glabrous; panicle contracted about the primary branches; leaf-blades linear [3. angolensis](#)

3 Lemmas minutely pubescent; glumes slightly shorter than the florets [1. buettneri](#)

Lemmas glabrous; glumes as long as or slightly longer than the florets [2. mauritiana](#)

4 Leaf-blades linear-lanceolate, 6–12 cm. long, glabrescent below; spikelets about 2 mm. long [4. guineensis](#)

Leaf-blades lanceolate, 3–6 cm. long, pubescent below; spikelets about 1.5 mm. long, rarely longer [5. kiyaensis](#)

1. **Isachne buettneri** *Hack.* in Verh. Bot. Ver. Prov. Brandenb. 31: 69 (1889); F.T.A. 9: 1091; Chev. Bot.

724, and in Rev. Bot. Appliq. 14: 40. *APD acc*

Ascending or half-climbing in forest shade.

Also in **Congo** and **Angola**.

71. HETERANTHOECIA

Stapf in Hook., Ic. Pl. 30: t. 2927 (1911); F.T.A. 9: 1098 (1934).

- 1 Leaf-blades lanceolate, short, 1.5–3 cm. long, 3–5 mm. broad; ligule a line of long fine hairs; spikelets borne in short one-sided racemes 0.5–1 cm. long scattered along a main axis; raceme rhachis ciliate on the margins, tapering to an acute tip; spikelets 1.5–2 mm. long; glumes subequal, a little shorter than the spikelet; lemmas chartaceous, the lower as long as the spikelet, subacuminate, glabrous except at the base; the upper half as long, pubescent [guineensis](#)

Heteranthoecia guineensis (*Franch.*) *Robyns* in Bull. Jard. Bot. Brux. 9: 201 (1932); F.T.A. 9: 1099; Berhaut, Fl. Sén. ed. 2, 403. *APD acc*

Dinebra guineensis *Franch.* in Bull. Soc. Hist. Nat. Autun 8: 376 (1895).

Heteranthoecia isachnoides *Stapf* (1911)—A. Chev. in Rev. Bot. Appliq. 14: 41.

Annual, up to 60 cm. high; culms ascending, rooting at the lower nodes; in swamps or pond margins.

Guin.: Timbi (Dec.) Jac.-Fél. 7421! Nimba Mts. (Apr.) Schnell 5038! **S.L.:** Rowala (July) Thomas 1091! Pateya to Njagbema (July) Deighton 5791! Lunsar (Mar.) Jordan 26! Tebor (July) Deighton 5808! Hepper 1185! **S. Nig.:** Enugu Jones FHI 6226!

Extends eastwards to **Uganda** and Tanzania, and southwards to the Congo and **Angola**.

72. SETARIA

P. Beauv., Ess. Agrost. 51 (1812); F.T.A. 9: 768 (1920–30); nom. cons.

- 1 Inflorescence a cylindrical spike-like panicle: 2
 Inflorescence a branched panicle: 7
- 2 Bristles retrorsely barbellate, clinging tenaciously to clothing; upper glume as long as the spikelet, concealing the smooth upper lemma [1. verticillata](#)
 Bristles antrorsely barbellate or smooth: 3
- 3 Annual; upper glume up to 1/2 as long as the spikelet, exposing the conspicuously rugose upper lemma; spikes 2–8 cm. long, rarely longer, with tawny bristles 6–8 mm. long; spikelets 2–2.3 mm. long [2. pallide-fusca](#)
 Perennials: 4
- 4 Basal sheaths pubescent with silky white hairs below; upper glume 4/5 to almost as long as the spikelet, concealing the obscurely rugose upper lemma; spikelets turgid; spikes 5–12 cm. long, yellowish green [3. ciliolata](#)
 Basal sheaths glabrous below; upper glume 1/4–3/4 as long as the spikelet, exposing the conspicuously rugose upper lemma; spikelets more or less dorsally compressed: 5
- 5 Culm 5–10-noded, 3–6 mm. diam. at base, compressed; basal sheaths strongly keeled and often flabellately interleaved, but falling away in older specimens; leaf-blades 4–10 mm. broad, glabrous; spikes 10–30 cm. long [4. anceps](#)
 Culms 2–4-noded, 1–3 mm. diam. at base, not compressed; basal sheaths more or less rounded on the back or weakly keeled, not flabellately folded; leaf-blades 2–6 mm. wide; spikes 5–20 cm. long: 6
- 6 Old leaf-sheaths breaking into a dense mass of fibres at the base; leaf-blades glabrous or sparsely hairy [5. aurea](#)
 Old leaf-sheaths not becoming fibrous at the base; leaf-blades glabrous [6. sphacelata](#)
- 7 Leaf-blades flat, not pleated; panicle branches glabrous or minutely scabrid, except for sparse tubercle-based hairs: 8
 Leaf-blades pleated fan-wise at the base; panicle branches pubescent, with or without tubercle-based hairs: 9
- 8 Upper lemma strongly transversely rugose; upper glume 1/2–2/3 as long as the spikelet; leaf-blades linear, firm, without false petioles [7. longiseta](#)
 Upper lemma smooth; upper glume 3/4 as long as the spikelet; leaf-blades lanceolate-linear, flaccid, the lower often narrowed at the base into a false petiole 1–8 cm. long [8. gracilipes](#)
- 9 Annual, up to 1 m. high, ascending or geniculate at the base; leaf-blades up to about 1.5 cm. wide; upper lemma strongly rugose [9. barbata](#)
 Perennials, with stout culms up to 3.5 m. high and broad leaf-blades up to 10 cm. wide; upper lemma obscurely rugose: 10
- 10 Spikelets 3–4 mm. long; lower lemma terminating in a short incurved beak, and exceeding the upper lemma by 0.2–0.5 mm.; panicle stiff, erect [10. caudula](#)
 Spikelets 2.5–5 mm. long; lower lemma equalling or very shortly exceeding the upper lemma: 11

- 11** Panicle stiff, erect, dense; the branches rigid, projecting from the main axis at an angle of 45°-90° or even slightly deflexed, decreasing gradually in length to form a pagoda-like spire; culm up to 4 mm. diam. at base of panicle; palea of lower floret as long as the lemma; leaf-sheaths glabrous; leaf-blades up to 10 cm. broad ..[11. megaphylla](#)

Panicle slender, more or less drooping, lax; the branches flexuous, ascending and often appressed to the main axis, of irregular lengths; culm up to 2 mm. diam. at base of panicle; palea of lower floret usually absent, less often up to 3/4 as long as the lemma, rarely of the same length; leaf-sheaths usually pilose with tubercle-based hairs, less often glabrous; leaf-blades usually under 5 cm. broad[12. chevalieri](#)

- 1. *Setaria verticillata* (Linn.) P. Beauv.** Ess Agrost. 51, 178 (1812); F.T.A. 9: 824; Chev. Bot. 734. and in Rev. Bot. Appliq. 14: 31; Berhaut, Fl. Sén. ed. 2, 393; De Miré & Gillet in J. Agric. Trop. 3: 735. *APD acc*

Panicum verticillatum Linn., Sp. Pl. ed. 2, 82 (1762).

P. adhaerens Forsk. (1775).

P. aparine Steud. (1854).

Setaria adhaerens (Forsk.) Chiov. in Nuov. Giorn. Bot. Ital. n.s. 26: 77 (1919).

Ascending annual up to 1 m. high; **weedy places.**

Maur.: Gani (Oct.) Hepper 3650! **Sen.:** Roger! **Gam.:** Ruxton 140! **Mali:** Sarédina (May) Davey 83; Dioura (Oct.) Davey 063! **U. Volta:** Ouahigouya (Aug.) Chev. 24871! Zoaga (Oct.) Tropical Africa.

[A variable species, the largest plants grading imperceptibly into the giant *S. splendida* Stapf (1930). These hybridize readily with the following two species; Hacker (in Austr. J. Bot. 16: 539, 551 (1968)) finds several polyploid levels in each, and little evidence of cytological barriers between them. Morphological distinctions are equally blurred, and it may be better to treat them as a single polymorphic species.—W.D.C.]

5. **Setaria aurea** *Hochst. ex A. Br.* in Flora 24: 276 (1841).

APD: Synonym of Setaria spacelata var. aurea (Hochst. ex A. Braun) Clayton

Pennisetum aureum *Hochst. ex A. Rich.*, Tent. Fl. Abyss. 2: 378 (1851).

Densely caespitose, up to 1.2 m. high.

Throughout tropical Africa. (See Useful Plants.)

[A variable grass in which forma with slender erect panicles and glabrous leaf-sheaths approach very closely to *S. megaphylla*, with which it may hybridize. It is closely related to *S. paniculifera* (Steud.) Fourn. of tropical America, which is distinguished by its narrower more acute spikelets.]

Setaria viridis (Linn.) P. Beauv. Ess. Agrost. 51, 171, 181 (1812). *APD acc*

Panicum viride Linn., Syst. Nat. ed. 10, 2: 870 (1759).

Annual, inflorescence spiciform; upper glume as long as the spikelet.

Niger: recorded at Aïr, by De Miré & Gillet in J. Agric. Trop. 3: 736 (1956).

Warm temperate regions.

Additional species.

73. SACCIOLEPIS

Nash in Britton, Man. Fl. North. U.S. 89 (1901); F.T.A. 9: 747 (1920).

- 1 False spikes much attenuated downwards, bearing there imperfect tightly appressed spikelets (these sometimes absent in the smallest spikes); branches fused with the axis of the false spike; spikelets 2.5–3.5 mm. long; lower glume with a single broad median nerve and hyaline margins; lower lemma with a U-shaped fringe of hairs on the back *L. ciliocincta*

- False spikes cylindrical, without imperfect florets; branches not or imperfectly fused with the axis; lower glume 3- or more-nerved; lower lemma glabrous or uniformly hairy:2
- 2 Spikelets 0.7–1 mm. long, glabrous [2. *micrococca*](#)
- Spikelets 1.8–4 mm. long:3
- 3 Spikelets dorsally slightly compressed, obtuse to subacute, quite glabrous, light green, 2.5–3 mm. long; false spikes stout, 10–30 cm. long, rarely shorter [3. *africana*](#)
- Spikelets more or less laterally compressed, acute to acuminate:4
- 4 Spikelets 1.8–2.5 mm. long; leaf-sheaths without auricles:5
- Spikelets 3–4 mm. long (rarely less); leaf-sheaths with auricles 0.5–5 mm. long at the mouth:6
- 5 Lower lemma conspicuously gibbous, the nerves thickened on the bulge; spikelets glabrous, strongly laterally compressed, 2.2–2.5 mm. long; spikes up to 40 cm. long [4. *cymbiandra*](#)
- Lower lemma not markedly gibbous, unthickened, the nerves distinct; spikelets nearly always hairy, slightly laterally compressed, 1.8–2.2(–2.5) mm. long; spikes up to 12 cm. long, rarely longer [5. *chevalieri*](#)
- 6 Annual, ascending from a decumbent rambling base emitting long aerial roots from its nodes; culms up to about 1.5 mm. diam. at the base; leaf-blades seldom over 15 cm. long; spikelets 3–3.5 mm. long, usually hairy [6. *auriculata*](#)
- Perennial, erect or ascending from a short underground rhizome; culms about 3 mm. diam. at the base; leaf-blades often 20–30 cm. long; spikelets 3.5–4 mm. long, usually glabrous [7. *rigens*](#)

1. ***Sacciolepis ciliocincta* (Pilger) Stapf** in F.T.A. 9: 751 (1920); Berhaut, Fl. Sén. ed. 2, 390. *APD acc*

Panicum ciliocinctum Pilger in Engl., Bot. Jahrb. 33: 48 (1904).

Annual up to 12 ins. high; [seasonal marsh on ironstone pavement](#).

Sen.: Tambacounda Berhaut 900. **iv. C.:** Bassawa (Oct.) Adjanohoun 276a! Bonndiali to Mankono (Nov.) Aké Assi 8286!

Panicum rigens Mez in Engl., Bot. Jahrb. 34: 141 (1903), not of Swartz (1788); F.T.A. 9: 767.

Sacciolepis auriculata of F.W.T.A., ed. 1, 2: 555, partly.

Up to 1.2 m. high, with light brown spikelets; on moist soils.

Ghana: Kete Krachi to Kpandui (Sept.) Rose Innes GC 30411! Kpandui (Sept.) Ankrah GC 20236! Yendi to Zabzugu (Oct.) Rose Innes GC 30695! Kpetchu to Kete Krachi (Oct.) Ankrah GC 20384! Tamale to Salaga (Aug.) Rose Innes GC 31875! **Togo Rep.:** Sokode to Basari Kersting 595!

74. CYRTOCOCCUM

Stapf in F.T.A. 9: 745 (1920).

- 1 Leaf-blades narrowly lanceolate to broadly linear, up to 12 cm. long and 1.5 cm. broad, very acute, thin,

prominently ciliate near the base; panicles delicate, broadly oblong to obcuneate in outline, somewhat flat-topped, the base enclosed in the uppermost leaf-sheath; pedicels long and slender, loosely beset with long white hairs; spikelets about 2 mm. long, dark brown; glumes thinly pilose[chaetophoron](#)

Cyrtococcum chaetophoron (*Roem. & Schult.*) *Dandy* in J. Bot. 69: 55 (1931); Berhaut, Fl. Sén. ed. 2, 413. *APD acc*

Panicum chaetopharon *Roem. & Schult.* in Linn., Syst. Veg., ed. 9, 2: 884 (1817).

Cyrtococcum setigerum *Stapf* in F.T.A. 9: 746 (1920); F.W.T.A., ed. 1, 2: 555; A. Chev. in Rev. Bot. Appliq. 14: 27.

Panicum setigerum *P. Beauv.* (1806), not of Retz. (1786).

Panicum jadinii *Steud.* (1854).

Isachne jadinii (*Steud.*) *Dur. & Schinz* (1894).

Perennial up to 1 m. high; culms slender, ascending; **forest shade**.

75. PANICUM

Linn., Sp. Plant. 55 (1753), and Gen. Pl. ed. 5, 29 (1754); F.T.A. 9: 638 (1920).

- 1 Inflorescence consisting of several more or less secund compound racemes, the secondary branches very short (3–5 mm. long) and closely appressed to the spreading primary branches; leaf-blades broadly linear, 2–8 mm. broad; spikelets glabrous, elliptic, 1–1.5 mm. long; lower glume about 1/3 as long as the spikelet; lower lemma 3-nerved; upper lemma smooth[1. laxum](#)
 Inflorescence an open panicle, very rarely with the spikelets loosely contracted about the primary branches:**2**
- 2 Spikelets slightly oblique to gibbous in profile, diffusely scattered in delicate open panicles; leaf-blades thin, ovate to lanceolate; upper glume and lower lemma 5-nerved:**3**
 Spikelets symmetrical in profile:**5**
- 3 Lower glume as long as the spikelet, lanceolate; spikelets 1.2–1.5 mm. long, glabrous or sometimes pubescent; leaf-blades ovate to lanceolate, amplexicaul at the base:**4**
 Lower glume half as long as the spikelet, broadly ovate; spikelets 1–1.2 mm. long, obscurely puberulous; leaf-blades narrowly lanceolate[4. trichoides](#)
- 4 Panicle branchlets viscid from brown patches of glandular tissue; upper lemma minutely papillose; rachilla internode not distinctly swollen[2. heterostachyum](#)
 Panicle branchlets neither viscid nor glandular; upper lemma smooth; second rachilla internode swollen, and covered by a small bulge at the base of the upper glume[3. brevifolium](#)
- 5 Upper glume and lower lemma pectinate at the tip, with 3 long and two smaller teeth; lower glume trifid (in West African specimens almost to the base, with the lateral lobes often suppressed); spikelets 3–3.5 mm. long; inflorescence axis often bearing clavate hairs[5. ecklonii](#)
 Upper glume and lower lemma entire:**6**
- 6 Axis and branches of the inflorescence bearing clavellate-tipped hairs:**7**
 Axis and branches of the inflorescence glabrous, or if hairy the hairs not clavellate-tipped:**8**
- 7 Lower glume 1-nerved, lanceolate; spikelets 2–3 mm. long; lower lemma 9-nerved; leaf-blades 2–8 cm. long and 2–8 mm. broad[6. hymeniophilum](#)
 Lower glume 5-nerved, ovate, 1/2–2/3 as long as the spikelet; spikelets 3 mm. long, oblong, acute; lower lemma 11-nerved; leaf-blades up to 12 cm. long and 20 mm. broad[7. sadinii](#)
- 8 Upper lemma transversely rugose; spikelets oblong, 3–3.5 mm. long; lower glume obtuse, about 1/3 as long as the spikelet; panicle up to 50 cm. long, the lower branches usually whorled[8. maximum](#)
 Upper lemma not transversely rugose:**9**
- 9 Upper lemma verrucose; spikelets broadly elliptic to subglobose in outline, obtuse to subacute at the apex, tending to break up at maturity; lower glume usually 2/3–4/5 as long as the spikelet (to p. 427): **10**

- Upper lemma smooth; spikelets acuminate or distinctly acute (except *P. parvifolium*), usually not plump (except *P. turgidum*): **19**
- 10** Perennials: **11**
- Annuals: **16**
- 11** Leaf-blades lanceolate, 5–13 cm. long, 5–17 mm. broad, glabrous, cordate at base; panicle loose, obovate; spikelets 1.5–2 mm. long, glabrous [9. dinklagei](#)
- Leaf-blades linear or involute: **12**
- 12** Spikelets 1–1.5 mm. long, greyish, pubescent; blades involute, sometimes flattened but rarely much over 2 mm. broad: **13**
- Spikelets 1.5–234 mm. long; leaf-blades linear, flat, 3 mm. or more broad: **14**
- 13** Culms usually 7- or more-noded, leafy; innovations extravaginal, the buds clad in short scales; leaf-blades involute or flattened, 5–15 cm. long; lower lemma truncate to emarginate at the tip with prominent hyaline wings; lower glume 3/4–4/5 as long as the spikelet [10. pubiglume](#)
- Culms 2–4-noded, the leaves mostly basal; innovations intravaginal, without scales; leaf-blades acicular, 2–12 cm. long; lower lemma obtuse at the tip without wings; lower glume 1/3–2/3 as long as the spikelet [11. filifolium](#)
- 14** Spikelets 1.5–1.8 mm. long, glabrous or pubescent, dull, yellowish grey; upper glume emarginate at the tip when flattened, the margins expanded into delicate narrow hyaline wings; panicle branches spreading; culms 1–3 mm. diam. at base; leaf-blades 3–10 mm. broad, 5–20 cm. long [12. strictissimum](#)
- Spikelets 1.7–2.5 mm. long, with a metallic bronze lustre; upper glume obtuse at the tip, without hyaline wings; panicle branches ascending: **15**
- 15** Culms stout, 2–4 mm. diam. at base; leaf-blades 5–10 mm. broad, 10–30 cm. long; spikelets usually glabrous [13. praealtum](#)
- Culms slender, up to 1 mm. diam. at base; leaf-blades 3–5 mm. broad, 5–20 cm. long; spikelets glabrous or pubescent [14. baumannii](#)
- 16** Upper lemma with deep longitudinal striations, verrucose only towards the tip; spikelets 2.5 mm. long, glabrous; leaf-blades 3–13 cm. long, 3 mm. broad [15. calocarpum](#)
- Upper lemma without incised striations: **17**
- 17** Leaf-blades linear, 2–7 cm. long, 1–3 mm. broad; spikelets (1-)1.4–1.7(-2) mm. long, grey to yellow, pubescent to villous, rarely glabrous; upper lemma warts hemispherical [16. lindleyanum](#)
- Leaf-blades lanceolate to linear-lanceolate: **18**
- 18** Blades 1–2(-3) cm. long, 2–3(-7) mm. broad; upper lemma warts longitudinally elongated; Spikelets 1–1.5 mm. long, glabrous or pubescent [17. glaucocladum](#)
- Blades 4–6 cm. long, 4–6 mm. broad; upper lemma warts hemispherical, prominent; spikelets 1.8–2.2 mm. long, glabrous [18. gracilicaule](#)
- 19** Spikelets 5–6 mm. long, glabrous; upper glume and lower lemma acuminate, 7-nerved [19. nigerense](#)
- Spikelets up to 4.5 mm. long, usually much less: **20**
- 20** Spikelets gaping open early and permanently, the tips of upper glume and lower lemma usually acuminate and turned slightly outwards: **21**
- Spikelets not conspicuously and permanently gaping or only when mature, the tips of the upper glume and lower lemma straight or slightly incurved: **30**
- 21** Perennials; lower glume mostly 1/2–2/3 as long as the spikelet: **22**
- Annuals; lower glume usually 3/4 as long as the spikelet or more; lower lemma 5-nerved; leaf-blades up to 20 cm. long, but usually less than 10 cm.: **27**
- 22** Upper glume and lower lemma 7–9-nerved: **23**
- Upper glume and lower lemma 5-nerved, or the former 7-nerved: **24**
- 23** Leaf-blades glaucous, glabrous, rarely over 25 cm. long, 4–6 mm. broad; spikelets 3.6–4.3 mm. long; panicle sparse, with 5–10 primary branches occurring singly [20. anabaptistum](#)
- Leaf-blades dark green, glabrous or pubescent, 40–70 cm. long, 6–10 mm. broad or more; spikelets 2.8–3.8 mm. long; panicle dense, with 15–25 or more primary branches usually occurring in whorls of 3–5 [21. phragmitoides](#)
- 24** Panicle with long spreading hairs from the branchlets, or at least from the pedicels; culms slender, 1.5 mm. diam. and compactly caespitose at the base; leaf-blades glabrous or hirsute, up to 3 mm. broad; spikelets 2–3 mm. long, the glumes acuminate and drawn out into awnlets 0.5–1 mm. long; roots pinkish [22. pilgeri](#)
- Panicle branches glabrous: **25**
- 25** Plants compactly caespitose, the slender culm up to 2 mm. diam. and coated with persistent leaf-sheaths which

- form a dense erect mass at the base of the plant; panicle 10–15 cm. long: **26**
- Plants neither compactly caespitose nor with a dense coat of persistent leaf-bases; culms 3–8 mm. diam. at base, rarely less; leaf-blades flat, 4–10 mm. broad; panicle 20–30 cm. long; spikelets 2–2.7 mm. long [25. fluviicola](#)
- 26** Leaf-blades up to 3 mm. broad, flat or often involute; basal sheaths silvery-tomentose below; spikelets 2–2.8 mm. long [23. dregeanum](#)
- Leaf-blades 0.5 mm. diam., setaceous, glabrous; basal sheaths glabrous or sometimes pubescent; spikelets 1.5–1.7 mm. long [24. congoense](#)
- 27** Branchlets, or at least the pedicel tips, bearing stiff white hairs up to 2 mm. long; spikelets pilose with tubercle-based hairs, rarely glabrous, 2–2.7 mm. long; whole plant softly pilose [26. griffonii](#)
- Branchlets, pedicels and spikelets glabrous: **28**
- 28** Glumes gaping widely, separated by an angle of 90°; spikelets 1.2–1.8 mm. long; lower glume long-acuminate, with an awn-point 0.3–0.5 mm. long [27. afzelii](#)
- Glumes not widely gaping, separated by an angle of about 45°: **29**
- 29** Spikelets 1.7–2.1 mm. long; lower glume at most acuminate, with a mucro up to 0.2 mm. long; panicle untidily ovate [28. walense](#)
- Spikelets 2.5–2.7 mm. long; lower glume drawn out into an awnlet 0.3–1 mm. long; panicle compactly lanceolate [29. paucinode](#)
- 30** Upper glume pilose above, and bearing 2–4 bristles as long as the spikelet; leaf-blades lanceolate, 3–8 cm. long, 8–23 mm. broad, with transverse veins; spikelets 2–2.5 mm. long; lower palea suppressed [30. acrotrichum](#)
- Upper glume glabrous or pubescent, but without long bristles: **31**
- 31** Lower lemma 3-nerved; spikelets 2 mm. long, pubescent, lanceolate; lower glume 1/3–1/2 as long as the spikelet, separated from the upper by an internode 0.1 mm. long; leaf-blades narrowly lanceolate, 3–8 cm. long [31. mueense](#)
- Lower lemma 5–11-nerved: **32**
- 32** Lower glume 1/2 as long as the spikelet or more, rarely less (*P. monticola*), lanceolate to ovate: **33**
- Lower glume 1/3 as long as the spikelet or less, very broadly ovate, clasping the base of the spikelet: **40**
- 33** Suffrutescent, with glaucous woody culms and hard pungent leaf-blades; spikelets (3-)3.5–4 mm. long, plump, acute at the tip; lower glume 2/3 to almost as long as the spikelet; lower lemma 9–11-nerved [32. turgidum](#)
- Herbaceous: **34**
- 34** Plants perennial, rambling or creeping, the leaf-blades narrowly lanceolate to lanceolate: **35**
- Plants annual; lower palea present: **38**
- 35** Leaf-blades less than 2 cm. long, lanceolate, amplexicaul at the base; spikelets 1.2–1.8 mm. long, elliptic-oblong, subacute, glabrous; lower glume 1/2–2/3 as long as the spikelet, 3-nerved [33. parvifolium](#)
- Leaf-blades mostly over 4 cm. long, not amplexicaul: **36**
- 36** Lower glume 3-nerved, 2/3–3/4 as long as the spikelet, lanceolate; leaf-blades mostly 5–12 cm. long, gradually tapering from base to tip, reflexed on the stem; spikelets 2–2.3 mm. long, glabrous or rarely scabrid-hairy, the nerves prominent and often forming raised ribs; lower palea present; inflorescence with or without long glistening white hairs on the axis [34. hochstetteri](#)
- Lower glume 1-nerved; lower palea absent: **37**
- 37** Lower glume ovate, 1/3–1/2 as long as the spikelet; spikelets 2.5–3 mm. long, glabrous; leaf-blades lanceolate (if linear see *P. coloratum*) [35. monticola](#)
- Lower glume lanceolate, 1/3–2/3 as long as the spikelet; spikelets 2–2.5 mm. long, glabrous or sparsely hispid [36. calvum](#)
- 38** Leaf-blades 1–2 cm. long, or sometimes a little longer, narrowly lanceolate, not amplexicaul; culms prostrate; spikelets 1.7–2 mm. long, glabrous or pubescent; lower glume 3-nerved, 3/4 the length of the spikelet; upper lemma smooth [37. pusillum](#)
- Leaf-blades 5–45 cm. long, linear; culms erect, robust; spikelets 2.5–3 mm. long, glabrous; lower glume 5-nerved: **39**
- 39** Spikelets borne in contiguous pairs, distant on long branchlets; lower glume sharply acute at the tip, 1/2–2/3 as long as the spikelet; palea about half as long as the lower lemma; leaf-blades softly hairy above and below [38. pansum](#)
- Spikelets neither paired nor contiguous, evenly spaced on the branches; lower glume obtuse to subacute at the tip, 1/2 as long as the spikelet or a little less; palea as long as the lower lemma; leaf-blades glabrous and glaucous, or stiffly pilose below near the base [39. laetum](#)
- 40** Leaf-blades linear, firm, not narrowed at the base: **41**
- Leaf-blades narrowly lanceolate, thin and delicate with fine transverse veins, up to 15 cm. long, narrowed to the

- midrib at the base: 44
- 41 Plants creeping, with long wiry underground rhizomes; barren shoots distichously leafy, the blades more or less involute, rigid and glaucous; lower lemma 9-nerved, with a palea [40. repens](#)
- Plants not creeping: 42
- 42 Spikelets cuspidate acuminate at the tip, 2.5–3.5 mm. long, narrowly ovate; lower lemma 7-nerved, accompanied by a palea; panicle broadly ovate, loose, the branches spreading [41. porphyrrhizos](#)
- Spikelets acute at the tip: 43
- 43 Lower floret without a palea (in most W. African plants), its lemma 9-nerved or very rarely 7-nerved; spikelets ovate-elliptic, 2.5–3 mm. long; panicle terminal, narrowly oblong, dense, the primary branches ascending with the spikelets loosely contracted about them [42. subalbidum](#)
- Lower floret with a palea, its lemma 7–9-nerved; spikelets ovate, plump, 2–3 mm. long, prominently nerved; panicle broadly ovate, more or less spreading [43. coloratum](#)
- 44 Upper glume 3-nerved; lower glume very broadly ovate, subacute [44. congoense](#)
- Upper glume 5-nerved; lower glume ovate-elliptic, usually obtusely rounded [35. monticola](#)

1. **Panicum laxum** Sw. Prod. Veg. Ind. Occ. 23 (1788); Hitchc. & Chase in Contrib. U. S. Nat. Herb. 15: 115; Aké Assi, Contrib. 2: 286. *APD acc*

Annual, 30–60 cm. high, the inflorescence superficially resembling that of a *Brachiaria*; **roadsides and clearings, particularly on damp soils.**

Guin.: Séguéa (Oct.) Adam 12641! **S. L.:** Freetown (May) Baldwin 5797! Njala (June) Deighton 732! Musaia (Mar.) Deighton 5439! Gbangbama to Senge (Nov.) Deighton 2343! Mt. Bintimani, 5,600 ft. A native of tropical America, introduced to W. Africa; first collected at Njala in 1927, it has now become naturalized.

2. **Panicum heterostachyum** Hack. in Oest. Bot. Zeitschr. 51: 430 (1901). *APD acc*

Erect or ascending annual up to 60 cm high; **in shade.**

Niger: Maradi to Takieta (Nov.) P. de Fabrègues 1217!

Widespread in Africa.

3. **Panicum brevifolium** Linn. Sp. Pl. 59 (1753); F.T.A. 9: 731; Chev. Bot. 724, and in Rev. Bot. Appliq. 14: 26; Berhaut, Fl. Sén. ed. 2, 416. *APD acc*

Panicum plantagineum Schumacher, Beskr. Guin. Pl. 64 (1827), not of Link (1827).

Panicum subobliquum Stapf in F.T.A. 9: 723 (1920); F.W.T.A. ed. 1, 2: 554; A. Chev. in Rev. Bot. Appliq. 14: 26.

Panicum ovalifolium Poir. (1816).

Panicum guineense Desv. ex Poir. (1816).

Panicum amplexicaule Poir. ex P. Beauv. (1819).

Panicum trichopiptum Steud. (1854).

A rambling annual 30–60 cm. high, with long aerial roots from the nodes; **forest shade.** Very rarely the outer spikelets of the panicle are long-hairy and apparently surrounded by a delicate halo.

Sen.: Sédhiou (Oct.) Adam 18445! Berhaut 6410! **Port. G.:** Bricama (Dec.) Pereira 3582! **Guin.:** Timbo Pobéguin 1722! Fouta Djallon (Oct.) Chev. 18755! Adam 12751! **S. L.:** Rokupr (Sept.) Throughout tropical Africa.

[Most West African plants have no lower palea, a short ligule, smooth upper leaf surface and erect culms. In eastern Africa this form is mixed with another form having a palea in the lower floret, a long ligule, scabrid upper leaf surface and decumbent culms; there are also intermediates in which the character correlation breaks down. The taxonomic significance of these forms is at present not clear. The species is closely allied to *P. dichotomiflorum* Michx. of America; the upper glume and lower lemma of the latter are nearly always 7-nerved, and it commonly bears both axillary and terminal inflorescences.]

43. **Panicum coloratum** *Linn.* Mant. 1: 30 (1767); F.T.A. 9: 713; incl. var. minus Stapf ex Chiov., Res. Sci. Miss. Stef.-Paoli 1, Bot. Coll. 183, 226 (1916); F.T.A. 9: 715. *APD acc*

Tufted perennial up to 1.2 m. high; introduced as a fodder grass.

N. Nig.: Arege, Bornu (Oct.) De Leeuw 2058!

Egypt to South Africa; introduced as a fodder grass to West Africa and other tropical countries.

[A polymorphic species from southern Africa. The specimen cited is a depauperate form known as var. minus.]

44. **Panicum comorense** *Mez* in Engl., Bot. Jahrb. 57: 185 (1921). *APD acc*

Weakly ascending annual, 30–60 cm. high, decumbent at the base; forest shade.

Ghana: Kpandu to Kete Krachi (Sept.) Rose Innes GC 30406! **N. Nig.:** Jemaa (Oct.) Gambles 64! **S. Nig.:** Olokemeji F.R. (Nov.) Jones, Eeay & Onochie FHI 14572! Jackson 1181168!

Throughout tropical Africa.

Imperfectly known species.

- Panicum deustum** *Thunb.* Prodr. 1: 19 (1794); Berhaut, Fl. Sén. ed. 2, 404, 415. *APD acc*

Sen.: Leprieur!

Apparently a mislabelled duplicate from Quartin Dillon's gathering of this species in Ethiopia.

- Panicum ozogonum** *Steud.* Syn. Pl. Glum. 1: 68 (1854). *APD acc*

Sen.: Leprieur.

Probably tile same as *Brachiaria ramosa*.

76. STENOTAPHRUM

Trin., Fund. Agrost. 175 (1820); F.T.A. 9: 578 (1920).

- 1 False spike winged, the herbaceous wings forming chambers on alternate sides of a wavy midrib and produced upwards into a broad acute tooth; racemes of 3–5 spikelets, sunk in chambers on the anterior face of the spike *1. dimidiatum*
- False spike subcylindrical, corky, entire; racemes bearing a solitary spikelet (rarely more) with a short barren rhachis appressed to its outer side, deeply embedded in the anterior face of the spike *2. secundatum*

1. **Stenotaphrum dimidiatum** (*Linn.*) *Brongn.* in Duperr., Bot. Voy. Coquille 127 (1831); F.T.A. 9: 580. *APD acc*

Panicum dimidiatum *Linn.*, Sp. Pl. 57 (1753).

Stenotaphrum glabrum *Trin.* (1820).

Stoloniferous perennial of coastal regions, with obtuse leaf-tips and compressed basal sheaths.

U. Volta: Ouagadougou (June) Scholz 113! **Ghana:** Accra (July) Rose Innes GC 30082! Ohawu (July) Irvine 4936! Aiyinase (July) Irvine 5103! Cape Coast (Sept.) Hall 2378!

Introduced into W. Africa; also in **E. Africa**, **Madagascar** and **India**.

2. **Stenotaphrum secundatum** (*Walt.*) *Kuntze* Rev. Gen. Pl. 2: 794 (1891); F.T.A. 9: 579 (excl. syn. *APD acc*

Stenotaphrum glabrum); *A. Chev.* in Rev. Bot. Appliq. 13: 891.

Ischaemum secundatum *Walt.*, Fl. Carol. 249 (1788).

Rotthoellia tripsacoides *Lam.*, Tab. Encycl. 1: 205 (1791).

Stenotaphrum glabrum of Chev. Bot. 737, not of Trin.

Stenotaphrum americanum *Schrank* (1820)—Berhaut, Fl. Sén. ed. 2, 389.

A strongly stoloniferous perennial of seashores, with obtuse leaf tips and compressed basal sheaths.

Sen.: Dakar (Dec.) Clayton 4073! **S. L.:** Smeathman! Freetown (Dec.) Deighton 465! Yele, Turtle Is. (Nov.) Deighton 2311! **Lib.:** Monrovia (Jan., Oct., Nov.) Linder 1426! Harley 1670! 1082a! Opobo (July) Jeffreys 18! **W. Cam.:** Victoria (July) Maitland 25!

The west coast of Africa from Sierra Leone to S. Africa, the east coast of America, the Pacific generally and **Australia**. (See Useful Plants.)

77. **ACROCERAS** Stapf in F.T.A. 9: 621 (1920). *APD acc*

- 1 Leaf-blades lanceolate, up to 20 mm. broad, rounded and contracted at the base; spikelets oblong, 5–5.5 mm. long; tips of keels of upper palea reflexed [1. *zizanioides*](#)
 Leaf-blades linear or narrowly linear-lanceolate, about 5 mm. broad, rounded- subcordate at the base and amplexicaul; spikelets lanceolate, 6 mm. long; tips of keels of upper palea reflexed [2. *amplectens*](#)

1. **Acroceras zizanioides** (Kunth) Dandy in J. Bot. 69: 54 (1931); Berhaut, Fl. Sén. ed. 2, 404.

Panicum zizanioides Kunth in Humb. & Bonpl., Nov. Gen. & Sp. Pl. 1: 100 (1816); Chev. Bot. 731 (excl. var.).
Acroceras oryzoides Stapf in F.T.A. 9: 622 (1920); A. Chev. in Rev. Bot. Appliq. 14: 18.
Panicum oryzoides Sw. (1788), not of Ard. (1763).
Echinochloa zizanioides (Kunth) Roberty (1955).

Rambling perennial 60–120 cm. high, rooting at lower nodes; moist and shady soils, or growing in shallow water.

Sen.: Sédhio (Nov.) Berhaut 6410 bis! **Guin.:** Kindia Jac.-Fél. 169! Timbo (Mar.) Pobéguin 1712! Nzérékoré (Sept., Oct.) Baldwin 9728! 13282! **S. L.:** Falaba (Mar.) Sc. Elliot 5097! Kanya (Oct.) Extends southward through E. Cameroun and the Congos to **Angola**; also in **India** and **tropical America**. (See Useful Plants.)

2. **Acroceras amplexens** Stapf in F.T.A. 9: 625 (1920); A. Chev. in Rev. Bot. Appliq. 14: 18; Berhaut, Fl. Sén. ed. 2, 404.

Panicum zizanioides var. **angustatum** A. Chev., Bot. 731 (1920), name only.
Acroceras basicladum Stapf in F.T.A. 9: 626 (1920).
Neohusnotia amplexens (Stapf) C. Hsu in Journ. Fac. Sci. Univ. Tokyo, Bot. 9: 94 (1965).

Scrambling annual 60–90 cm. high, rooting at the lower nodes; marshy places or shallow water.

Sen.: Casamance (Jan.) Chev. 2188! Bignona (Sept.) Adam 18054! Djembering (Sept.) Broadbent 142! **Gam.:** Wallikunda (Aug.) Macluskie 8! Sankuli Kunda (Sept.) Uguoka, Awka (Aug.) Jones FHI 6697! Ogoja to Abakaliki (Aug.) Tuley 761!

Also in the **Sudan**, **C. African Rep.** and **Congo**. (See Useful Plants.)

78. MICROCALAMUS

Franch. in Journ. de Bot. 3: 282 (1889), not of Gamble (1890); F.T.A. 9: 490 (1919).

- 1 Leaf-blades mostly 5–8 cm. long and 2–3.5 cm. broad, glabrous, much constricted at the base; sheaths and nodes pilose, with a transverse ciliate rim on the outside at junction of sheath and blade; spikelets 6–6.5 mm. long, slightly compressed laterally; lower glume adaxial, about a quarter the length of the spikelet; upper lemma laterally flattened at the tip, its margins inrolled over the prominent keels of the palea; callus of the upper floret rounded [barbinodis](#)

Microcalamus barbinodis *Franch.* in Journ. de Bot. 3: 282 (1889); F.T.A. 9: 491. *APD acc*

Ascending perennial about 30 cm. high with wiry culms; **forest shade**.

W. Cam.: Banga, S. Bakundu F.R. (Mar.) Brenan 9442!

Also in **Middle Congo**.

79. COMMELINIDIUM

Stapf in F.T.A. 9: 627 (1920).

- 1 Leaf-blades mostly 5–8 cm. long and 1.5–3.5 cm. broad, glabrous, minutely pubescent or sparsely pilose, much constricted at the base, acuminate at the tip; spikelets 5–5.5 mm. long, dorsally flattened; lower glume abaxial, about half the length of the spikelet, separated from the upper by an internode 1 mm. long; upper lemma laterally flattened at the tip, and with a rounded callus [gabunense](#)

Commelinidium gabunense (*Hack.*) *Stapf* in F.T.A. 9: 629 (1920).

APD: *Synonym of Acroceras gabunense (Hack.) Clayton*

Panicum gabunense *Hack.* in Verhandl. Bot. Ver. Brandenb. 31: 70 (1889).

Commelinidium nervosum *Stapf* in F.T.A. 9: 628 (1920); F.W.T.A., ed. 1, 2: 558; A. Chev. in Rev. Bot. Appliq. 14: 19.

Commelinidium mayumbense (*Franch.*) *Stapf* l.c.;

Panicum mayumbense *Franch.* in Bull. Soc. Hist. Nat. Autun 8: 343 (1895).

Echinochloa nervosa (*Stapf*) *Roberty* (1965).

A scrambling perennial emitting long aerial roots from the nodes; **forest shade**.

Lib.: Soplima (Nov.) Baldwin 10069! Wanau (Jan., Dec.) Harley 1727! 2105! Bahtown (Aug.) Baldwin 8033! Zeahtown (July) Baldwin 6932! **iv. C.:** Guidéko Chev. 16396! Assikasso (Dec.) Chev. 22598! Bouaké (Oct.) Adjanohoun 404a! Issia (Aug.) Boughéy GC 14678! **Ghana:** Cape Coast (July) Hall 1512! Jachi, Kumasi (July) Thorold CB 113! Yaya F.R. (Dec.) Adams 5231! Kumasi (Oct.) Baldwin 13472! Volta River F.R. (Nov.) Morton GC 6069! **N. Nig.:** Acharane F.R., Kabba Prov. (Nov.) Latilo FHI 34016! **S. Nig.:** Olokemeji (Nov.) Jackson 181169! **W. Cam.:** Mamfe (Mar.) Coombe 197!

Also in **E. Cameroun**, **the Congos**, **Uganda** and **Angola**.

80. ICHNANTHUS

P. Beauv., Ess. Agrost. 56 (1812); F.T.A. 9: 743 (1920).

- 1 Leaf-blades broadly lanceolate, oblique and rounded on one side at the base, 5–6 cm. long and 1.5–2 cm. broad; inflorescence lax, the upper primary branches racemose, the lower usually with secondary branches; spikelets 4.5–5 mm. long, strongly nerved, on pedicels up to 1 cm. long; lower glume abaxial; callus of the upper floret drawn into a very short stipe with small lateral hyaline wings [vicinus](#)

Ichnanthus vicinus (*Bail.*) *Merr.* Enum. Phillip. Fl. Pl. 1: 70 (1923). *APD acc*

Panicum vicinum *Bail.*, Syn. Queensl. Fl. Suppl. 3: 82 (1890).

Ichnanthus pallens of F.W.T.A., ed. 1, 2: 554, of F.T.A. 9: 744, and of A. Chev. in Rev. Bot. Appliq. 14: 27, not of Munro.

Perennial, up to 60 cm. high, rooting at the lower nodes.

S. L.: Tingi Mts. (Dec.) Morton & Gledhill SL 3013! Mamaha (Nov.) Thomas 4635! 4571! **Lib.:** Nimba (Dec.) Adames 807!

Also in **E. Cameroun**, throughout tropical Asia, and in **Australia**.

[Closely allied to *I. pallens* (Sw.) Munro from tropical America, which has shorter spikelets, and a more compact panicle].

81. CHLOACHNE

Stapf in Hook., Ic. Pl. t. 3072 (1916); F.T.A. 9: 489 (1919).

- 1 Leaf-blades lanceolate, 6–12 cm. long and 5–15 mm. broad, acuminate, asymmetrical at the base; racemes distant; spikelets 7 mm. long; lower glume abaxial, about two thirds as long as the spikelet *oplismenoides*

Chloachne oplismenoides (Hack.) *Stapf ex Robyns* in Bull. Jard. Brux. 9: 173 (1932).

APD: *Synonym of Poecilostachys oplismenoides* (Hack.) Clayton

Panicum oplismenoides Hack. in Bol. Soc. Brot. 6: 141 (1888).

Chloachne secunda *Stapf* in Hook., Ic. Pl. t. 3072 (1916); F.T.A. 9: 489.

Poecilostachys flaccidula *Stapf ex Rendle* in J. Linn. Soc. 40: 231 (1911).

Oplismenus anomalus Mez ex Peter in Fedde, Rep., Beih. 40, 1: 220, 222 (1981).

A trailing grass with long aerial roots from the lower nodes; in montane forest shade.

S. Nig.: Sonkwala, 5,200 ft, Obudu Div., (Dec.) Savory & Keay FHI 25257! **W. Cam.:** Cam. Mt., 4,000 ft. (Feb.) Mann 1354! Liwanga, 5,500 ft. (Mar.) Brenan 9551! Esole, 5,200 ft. (Feb.) Maitland 1031! Buea (Jan.) Maitland 340! Bafut-Ngamba F.R., 7,000 ft. (Feb.) Hepper 2197! **F. Po:** El Pico, 4,800 ft. (Dec.) Boughey 167!

In montane forests of **Sudan**, **Ethiopia**, **Kenya**, **Tanzania**, **Rhodesia** and **Malawi**.

82. PSEUDECHINOLAENA

Stapf in F.T.A. 9: 494 (1919).

- 1 Leaf-blades lanceolate, 1–6 cm. long; inflorescence slender, of several lax racemes; spikelets about 4 mm. long, obliquely ovoid, gaping; lower glume almost as long as the spikelet, adaxial; upper glume shorter, gibbous, usually armed with conspicuous hooked bristles but these sometimes short and appressed; lower lemma chartaceous, with membranous margins *L. polystachya*

Pseudechinolaena polystachya (Kunth) *Stapf* in F.T.A. 9: 495 (1919); A. Chev. in Rev. Bot. Appliq. 13: 884. *APD acc*

Echinolaena polystachya Kunth in Humb. & Bonpl., Nov. Gen. & Sp. 1: 119 (1816).

Echinochloa polystachya (Kunth) *Roberty* (1955), not of Hitchc. (1920).

Panicum uncinnatum *Raddi* (1823)—Chev. Bot. 730.

Culms slender, ascending, the prostrate portion rooting from the nodes and often forming a dense carpet; a forest grass in damp shady places.

Guin.: Dalaba-Diaguissa Plateau Chev. 18570! Dyecke (Sept., Oct.) Baldwin 9667! 13323! **S. L.:** Potoru (Apr.) Deighton 1662! Kenema (Nov.) Deighton 416! Musaia (Dec.) Deighton 5699! Gebwema (Oct.) Deighton 5193! Pyne 15! **Lib.:** Nimba (Dec.) Adam 16500! Wohmen (Oct.) Baldwin 12029! Gbanga (Sept.) Linder 705! Dubo (Sept.) Baldwin 9484! Wanau (Nov.) Harley 2056! **Iv. C.:** Nimba (Aug.) Boughey GC 18173! Mt. Tonkoui (Oct.) Adjanohoun 398a! **Ghana:** Bunsu (July) Thorold 110! Aburi (June) Ankrah GC 20051! Amentia (Aug.) Vigne FH 3998! Kwahu (Bee.) Adams 5115! Kumasi (Oct.) Baldwin 13471! **S. Nig.:** Oyo (Apr.) Haines 200! Okomu F.R. (June, Dec.) Onochie FHI 34615! Brenan 8506! Aboh Barter 1354! Oban Talbot 851! **W. Cam.:** Esole (Feb.) Maitland 1030! Buea (Jan., Feb., Dec.) Keay FHI 28577! Hinds C1! Maitland 147! Ndop (Dec.) Boughey GC 1112! **F. Po:** Monte Balea (Dec.) Guinea 347! Moka (Dec.) Boughey 151!

Occurs throughout the tropics.

83. ERIOCHLOA

Kunth in Humb. & Bonpl., Nov. Gen. & Sp. 1: 94 (1815); F.T.A. 9: 497 (1919).

- 1 Lower glume suppressed, more or less adnate to the swollen lowest rhachilla internode, and terminating in an obscure rim above it; racemes simple, the spikelets pedicelled in pairs; spikelets mostly 3–3.5 mm. long, sparsely appressed-pilose, lanceolate, acuminate; upper glume produced into an awn-point 0.2–1 mm. long or more; lower floret reduced to a barren lemma; upper lemma obtuse, and bearing a mucro 0.1–0.6 mm. long [1. nubica](#)

Lower glume developed, about 0.5 mm. long, obscurely and obtusely 3-lobed, adnate below to the swollen internode; racemes usually compound, the rhachis triquetrous, and the spikelets borne upon short aide branches; side-branches commonly oppressed to the rhachis, but sometimes spreading and paniculate; spikelets 3–3.8 mm. long, glabrous or pilose, ovate-lanceolate, acute; upper glume acute; lower floret with a well developed palea; upper lemma obtuse, with a minute mucro at the apex [2. meyerana](#)

1. **Eriochloa nubica** (Steud.) Hack. & Stapf ex Thell. in Vierteljahrschr. Nat. Ges. Zurich 64: 697 (1919); Chev. Bot. 723; Lebrun in Bull. Soc. Bot. Fr. 118: 262 (1969).

APD: *Synonym of Eriochloa fatmensis* (Hochst. & Steud.) Clayton

Helopus nubicus Steud., Syn. Pl. Glum. 1: 100 (1854).

Eriochloa acrotricha (Steud.) Hack. ex Thell. op. cit. 52: 435 (1907), not of Hack. (1905); F.W.T.A., ed. 1, 2: 564; F.T.A. 9: 499; A. Chev. in Rev. Bot. Appliq. 13: 884; Berhaut, Fl. Sén. ed. 2, 404.

Helopus acrotrichus Steud. (1854).

Digitaria acrotricha (Steud.) Roberty (1955).

Tufted annual 30–60 cm. high.

Maur.: Gani (Oct.) Hepper 3653! **Sen.:** Dakar (Jan.) Chev. 2289! Richard-Tol Roger 17! **Mali:** Boré (Aug.) Demange 18/1957! **Ghana:** Bawku to Gambaga (Oct.) Ankrah GC 20283! Cape Coast (Mar.) Hall 1316! Nungua, Accra (Feb., Oct.) Rose Innes GC 30333! Ankrah GC 20091! Keta (June) Thorold 88! **N. Nig.:** Kano (Nov.) Taylor 4! Bumsa (Aug.) De Leeuw 1129! Ngala Gwynn 113! Maiduguri to Dikwa (Oct.) De Leeuw 1830! South of Arege (Oct.) De Leeuw 2073!

Widely spread in tropical and S. Africa, extending into [Arabia](#). (See Useful Plants.)

2. **Eriochloa meyerana** (Nees) Pilger in Engl. & Prantl, Pflanzenfam., Aufl. 2, 14, c: 56 (1940). *APD acc*

Panicum meyeranum Nees, Fl. Afr. Austr. 32 (1841); F.T.A. 9: 650; F.W.T.A. ed. 1, 2: 551.

Eriochloa borumensis Hack. (1901), not of Stapf in F.T.A. 9: 500 (1919).

Perennial, 90–120 cm. high.

Ghana: Irvine 1427! Cape Coast (May) Hall 2975! Christiansborg (Apr.) Johnson 1036! Labadi, Accra (Mar.) Morton GC 6654! Nungua, Accra (Nov.) Ankrah GC 20033!

Throughout tropical and S. Africa, extending into [Arabia](#); also in [Thailand](#).

The species is almost exactly intermediate between *Brachiaria mutica* and *Eriochloa borumensis* of Stapf (not of Hack.), some specimens approaching very closely to these extremes.

84. OPLISMENUS

P. Beauv., Fl. Oware 2: 14 (1808); F.T.A. 9: 630 (1920).

- 1 Perennial; awns viscid, smooth, stiff, the tips truncate; leaf-blades narrowly ovate to lanceolate-linear, 1.5–12 cm. long and 7–25 mm. wide, rounded at the base, the tip acuminate; racemes 0.5–3 cm. long; spikelets 2–4 mm. long, with awns up to 15 mm. long [1. hirtellus](#)

Annual; awns antorsely barbellate, slender, flexuous, tapering; leaf-blades narrowly ovate to lanceolate, 1.5–4 cm. long and 3–11 mm. broad, rounded at the base, the tip acuminate; racemes 0.8–2 cm. long; spikelets 2–2.5 mm. long, with awns up to 10 mm. long [2. burmannii](#)

1. **Oplismenus hirtellus** (Linn.) P. Beauv. Ess. Agrost. 54, 170 (1812); F.T.A. 9: 631; Chev. Bot. 733, and in Rev. Bot. Appliq. 14: 19; Berhaut, Fl. Sén. ed. 2, 401. *APD acc*

APD: *Synonym of Oplismenus hirtellus subsp. capensis* (Hochst.) Mez ex U. Scholz

Panicum hirtellum Linn., Syst. Nat., ed. 10, 2: 870 (1759).

P. incanum Schumacher. (1827).

Oplismenus africanus P. Beauv. (1808).

Straggling, often with long aerial roots from the nodes; **forest shade**. Rather variable, particularly in the size, shape and hairiness of its leaf-blades, and also in panicle characters.

Sen.: Tanma (July) Berhaut 2779! Mbidjem (Oct.) Raynal 6469b. **Mali:** Sikasso (Dec.) Vuillet 506! **Guin.:** Baffing R. (Nov.) Pobéguin 1737! **S. L.:** Mamaha Thomas 4639! Njala (Nov.) 85. ECHINOCHLOA

P. Beauv., Ess. Agrost. 53 (1812); F.T.A. 9: 604 (1920). *APD acc*

- 1 Ligule represented by a fringe of hairs, at least in the lower leaves:2
Ligule absent:4
- 2 Spikelets obtuse, 3 mm. long (if 4 mm. long see *Brachiaria obtusiflora*), scaberulous towards the tips only; lower glume obtuse, about a third as long as the spikelet; upper glume as long as the spikelet; racemes erect, about 2 cm. long, nearly their own length apart [1. obtusiflora](#)
Spikelets acute, acuminate or awned, scabrid or ciliate on the nerves:3
- 3 Spikelets mostly 2.5–3.5 mm. long, awnless; racemes 20 or more, up to 8 cm. long, in a dense panicle up to 30 cm. long [2. pyramidalis](#)
Spikelets mostly 4–6 mm. long, the upper lemma usually with an awn 4–20 mm. long; racemes 5–15, up to 6 cm. long; inflorescence variable, the spikelets densely imbricate and the racemes closely overlapping, or the spikelets contiguous and secund and the racemes distant [3. stagnina](#)
- 4 Racemes simple, 1–3 cm. long, suberect, about half their own length apart, alternate or rarely in whorls of 2 or 3; spikelets 2–3 mm. long, acute or cuspidate, sometimes with the lower lemma drawn out into a short awn-point up to 1 mm. long; leaf-blades 3–7 mm. broad [4. colona](#)
Racemes compound, up to 10 cm. long, the spikelets densely clustered on short side branches; spikelets 2.5–3 mm. long, the lower lemma usually with a short awn up to 2 mm. long; leaf-blades 10–15 mm. broad. [5. crus-pavonis](#)

1. *Echinochloa obtusiflora* Stapf in F.T.A. 9: 606 (1920); Berhaut, Fl. Sén. ed. 2, 406. *APD acc*

Erect annual up to 1 m. high; in shallow pools and wet places.

Throughout the tropics and subtropics. (See Useful Plants.)

[E. colona is rather more variable in Africa than elsewhere in its range. Forms with cuspidate spikelets 2.5–3 mm. long and with 2–3 branches from the lowest node of the panicle have been separated as E. equitans and E. verticillata, but they appear to grade imperceptibly into typical E. colona. Our species differs from E. crus-galli (Linn.) P. Beauv. of warm temperate regions in its simple shorter racemes, narrower leaf-blades, and smaller awnless spikelets; I have seen no specimens entirely typical of E. crus-galli from our area. but those marked* approach very closely to it. The declension of the epithet depends upon whether it is regarded as a noun or as an adjective. Lexicographers differ, but the adjectival use was acceptable to those of Linnaeus' own time.—W.D.C.]

5. *Echinochloa crus-pavonis* (Kunth) Schult. Mant. 2: 269 (1824); F.T.A. 9: 612; A. Chev. in Rev. Bot. Appliq. 14: 17; Aké Assi, Contrib. 2: 292. *APD acc*

Opismenus crus-pavonis Kunth in Humb. & Bonpl., Nov. Gen. & Sp. 1: 108 (1815).

Erect annual 1–2 m. high; **near water.**

Throughout tropical Africa, extending eastwards to **Egypt**, Madagascar and India, and westwards to tropical America. (See Useful Plants.)

87. UROCHLOA

P. Beauv., Ess. Agrost. 52 (1812); F.T.A. 9: 586 (1920).

- 1 Leaf-blades linear-lanceolate, coarsely pilose with tubercle-based hairs; spikelets ovate, acuminate, 5 mm. long, borne singly in two rows on the raceme; lower glume irregularly truncate, narrower than the spikelet and about 3/4 as long, with a tuft of tubercle-based hairs in the centre; upper glume as long as the spikelet, pubescent; lower lemma ciliate with tufts of tubercle-based hairs along the margins; upper lemma broadly ovate, transversely rugose, the mucro up to 1.5 mm. long [trichopus](#)

Urochloa trichopus (Hochst.) Stapf in F.T.A. 9: 589 (1920); A. Chev. in Rev. Bot. Appliq. 13: 891. **APD acc**

Panicum trichopus Hochst. in Flora 27: 254 (1844).

A coarsely leaved annual about 60 cm. high.

Sen.: Dahra (Oct.) Raynal 7642 bis. Ndjarno (Sept.) Raynal 7565. **Mali:** Gao (Sept.) Hagerup 349! Wailly 4750 bis! Gourma to Haoussa (July) Rogeon 462! **N. Nig.:** Garin Basan (Aug.) De Leeuw 1095! Bama (Oct.) De Leeuw 1836!

Extends eastwards to Eritrea and south to Mozambique. (See Useful Plants.)

88. BRACHIARIA

Griseb. in Ledeb., Fl. Ross. 4: 469 (1853); F.T.A. 9: 505.

- 1 Lower glume 3/4 or more than 3/4 as long as the spikelet, obtuse, 9–13-nerved: **2**
Lower glume at most half as long as the spikelet (rather longer in *B. xantholeuca*): **5**
- 2 Spikelets glabrous, conspicuously reticulate-nerved, 4–4.5 mm. long, sessile, borne in 1–2 rows upon a narrow rhachis with sparsely ciliate margins; leaf-blades linear-lanceolate, the margins cartilaginous and minutely undulate-serrulate [1. stigmatisata](#)
Spikelets hairy; perennials: **3**
- 3 Rhachis of racemes subtriquetrous, wavy, glabrous or with a few scattered hairs along the margins; spikelets 4–5 mm. long, in 1–2 rows; upper glume and lower lemma pubescent; leaf-blades linear lanceolate, the margins cartilaginous and minutely spinulose [2. humidicola](#)
Rhachis of racemes herbaceous, more or less ribbon-like, with the setulosely ciliate margins curving over the base of the spikelets; spikelets mostly 3–3.5 mm. long: **4**
- 4 Leaf-blades convolute, glaucous, up to 4 mm. broad; racemes up to 3 cm. long sparsely ciliate with pale hairs at most 2 mm. long [3. falcifera](#)
Leaf-blades flat, 4–10 mm. broad; racemes up to 5 cm. long, copiously ciliate with fulvous hairs up to 4 mm. long [4. jubata](#)
- 5 Rhachis of racemes flat, herbaceous, more or less ribbon-like; spikelets glabrous: **6**
Rhachis of racemes triquetrous or filiform: **8**
- 6 Spikelets 4–5 mm. long, solitary, subsessile, in 1–2 rows; margins of raceme-rhachis scabrid (if ciliate see *B. brizantha*); lower glume separated from the upper by an internode 0.5 mm. long [5. plantaginea](#)

- Spikelets 2.5–3.5 mm. long; margins of raceme-rhachis scabrid (but pedicels may be setose); internode between glumes obscure or absent: [7](#)
- 7** Spikelets sessile in 1 row; racemes 2–4, 2–6 cm. long; leaf-blades linear, up to 6 mm. broad [6. distachyoides](#)
- Spikelets paired, one of each pair on an elongated pedicel, usually irregularly 4-rowed, often borne upon short side-branches (very rarely sessile in 2 rows); racemes 8–20, 2–8 cm. long; leaf-blades lanceolate-linear, up to 10 mm. broad [7. mutica](#)
- 8** Plants perennial: [9](#)
- Plants annual, the basal sheaths glabrous or pubescent: [10](#)
- 9** Spikelets 4.5–5.5 mm. long, in 1 row, narrowed at the base into a short stipe 0.5 mm. long, glabrous or rarely sparsely hairy; margins of raceme-rhachis ciliate [8. brizantha](#)
- Spikelets 2–3 mm. long, in 2 rows, silky villous, usually with a transverse apical fringe, rarely almost glabrous; basal leaf-sheaths woolly tomentose; lower lemma muticous or with an awn-point up to 2 mm. long [9. brachylopha](#)
- 10** Lowest internode of rhachilla forming a bead-like swelling covered by the base of the lower glume; spikelets 3–4 mm. long, glabrous, in 2 (rarely 4) rows [10. callopus](#)
- Lowest internode of the rhachilla not swollen, though sometimes elongated: [11](#)
- 11** Racemes densely and irregularly 4-rowed, the spikelets borne on short side branches; spikelets 3.5–4.5 mm. long, plump, glabrous, narrowed at the base into a little stipe 0.5 mm. long [11. obtusiflora](#)
- Racemes 1–2-rowed, or spikelets much shorter: [12](#)
- 12** Spikelets 4–4.5 mm. long, obtuse to subacute, glabrous; racemes loosely 2-rowed, the spikelets paired with the primary pedicelled; leaf-blades glabrous to pilose below, the margins cartilaginous and serrulate [12. serrifolia](#)
- Spikelets 2–4 mm. long: [13](#)
- 13** Leaf-blades velvety pubescent, not cartilaginous on the margin; spikelets 3–4 mm. long, nearly always solitary and sessile in two dense rows, hispidulous (rarely glabrous), rostrate-acuminate or cuspidate at the tip, narrowed at the base into a short stipe up to 0.5 mm. long; racemes 1–3 cm. long [13. xantholeuca](#)
- Leaf-blades glabrous, pilose or (in *B. distichophylla*) pubescent; spikelets 2–3 mm. long, paired with one of the spikelets more or less pedicelled, or borne on short side branches (but often solitary in *B. distichophylla*), glabrous or hispidulous, the stipe obscure or absent: [14](#)
- 14** Spikelets 2–2.5 mm. long; leaf-blades 2–8 mm. wide and 1–8 cm. long, the margins cartilaginous and spinulose; racemes slender, secund: [15](#)
- Spikelets 2.5–3 mm. long; leaf-blades up to 20 mm. broad and 25 cm. long, not cartilaginous on the margins; racemes scarcely secund, 2–8 cm. long: [16](#)
- 15** Spikelets solitary above, paired below and sometimes on very short secondary branches at the base of the raceme, not gaping; racemes 1–4 cm. long [14. distichophylla](#)
- Spikelets borne on short side-branches, forming little clusters or glomerules of 2–6, frequently gaping; racemes up to 8 cm. long [15. kotschyana](#)
- 16** Pairs of spikelets very loosely scattered, distant by up to 10 mm. or more; primary pedicels up to 10 mm. or more long [16. deflexa](#)
- Pairs of spikelets approximate, evenly distant by less than their own length; primary pedicels not more than 2 mm. long: [17](#)
- 17** Margins of leaf-blades ciliate with tubercle-based hairs towards the rounded base; spikelets mostly sessile [17. lata](#)
- Margins of leaf-blades not ciliate below; one spikelet of each pair usually pedicelled [18. ramosa](#)

1. *Brachiaria stigmatisata* (Mez) Stapf in F.T.A. 9: 520 (1919); A. Chev. in Rev. Bot. Appliq. 13: 885; Berhaut, Fl. Sén. ed. 2, 404; Aké Assi, Contrib. 2: 293. *APD acc*

Awka (June) Jones FHI 1784!

Probably throughout tropical Africa, but the taxonomy of the species in east and central Africa is confused as it tends to intergrade with the following. (See Useful Plants.)

15. *Brachiaria kotschyana* (Hochst. ex Steud.) Stapf in F.T.A. 9: 559 (1919); A. Chev. in Rev. Bot. Appliq. 13: 889.

APD: *Synonym of Urochloa comata* (Hochst. ex A. Rich.) Sosef

Panicum kotschyenum Hochst. ex Steud., Syn. Pl. Glum. 1: 68 (1854); Chev. Bot. 727.

Slender annual about 60 cm. high.

Sen.: Kayar (Sept.) Raynal 7347! **N. Nig.:** Yola (July, Sept.) Dalz. 275! Kennedy FHI 7286! Ibaji Ojoko F.R., Kabba Prov. (June) Latilo FHI 47753! Gembu, Mambila (Sept.) Oche 87! **S. Nig.:** Aguhu Thomas 1390! **W. Cam.:** Wum, Bamenda (Dec.) Boughey GC 11568!

Extends eastwards to Eritrea, and south to **Angola** and the Congo. (See Useful Plants.)

16. *Brachiaria deflexa* (Schumach.) C. E. Hubbard ex Robyns in Bull. Jard. Bot. Brux. 9: 181 (1932); Berhaut, Fl. Sén. ed. 2, 413; incl. var. *sativa* Portères in Agron. Trop. 6: 38 (1951), without latin descr. *APD acc*

Panicum deflexum Schumach., Beskr. Guin. Pl. 63 (1827).

Krachiaria regularis (Nees) Stapf in F.T.A. 9: 544 (1919); A. Chev. in Rev. Bot. Appliq. 13: 886; De Miré & Gillet in J. Agric. Trop. 3: 728.

Panicum regulare Nees, Fl. Afr. Austr. 41 (1841).

P. nudiglume Hochst. (1844)—Chev. Bot. 728.

Pseudobrachiaria deflexa (Schumach.) Launert in Mitt. Bot. Munchen 8: 158 (1970).

Annual up to 45 cm. high; the inflorescence, with its distant spikelets and long pedicels, simulates a panicle, and the plant is commonly mistaken for a species of *Panicum*; a weed of cultivated land and disturbed soils.

Gam.: Dipa Kunda Fox 157! **Mali:** Sompi (Aug.) Chev. 2282! Boré (Aug.) Demange 19/1957! Port G.: Contubo (Aug.) Pereira 3113! **Iv. C.:** Adiopodoumé (Nov.) Leeuwenberg 1937! Extending east to Ethiopia and Arabia.

B. lata var. pubescens C. E. Hubbard in Kew Bull. 4: 125 (1949), distinguished by its pubescent spikelets, is occasionally found in our area.

18. **Brachiaria ramosa** (Linn.) Stapf in F.T.A. 9: 542 (1919); A. Chev. in Rev. Bot. Appliq. 13: 886; Berhaut, Fl. Sén. ed. 2, 405. *APD acc*

Panicum ramosum Linn., Mant. 1: 29 (1767); Chev. Bot. 729.

Echinochloa ramosa (Linn.) Roberty in Bull. I.F.A.N. 17: 64 (1955).

Panicum arvense, Kunth (1831).

P. brachylachrum Steud. (1854).

P. cognatissimum Steud. (1854).

Urochloa ramosa (Linn.) Nguyen in Nov. Sist. Vys. Rast. 1966: 13 (1966).

Annual 30–60 cm. high.

Maur.: Gani (Oct.) Hepper 3655! **Sen.:** Roger 15! Richard-Tol (Aug.) Roger 34! Bargny (Aug.) Adam 14925! Dakar (Apr.) Clayton 4003! **Gam.:** Yundum (Sept.) Wallace 7! **Mali:** Damako (Sept.) Adam 15367! El Oualadji (Mar.) Chev. 43915! Diré (May) Rogeon & Leclercq 268! Bore (Aug.) Demange 20/1957! Timbuktu (Aug.) Hagerup 259! **Port. G.:** Pirada (June) Esp. Santo 3037! **N. Nig.:** Kalkala, Chad Golding 78!

Also in eastern Tropical Africa, extending to India and Thailand.

89. ENTOLASIA

Stapf in F.T.A. 9: 739 (1920).

- 1 Leaf-blades lanceolate, up to 18 mm. broad, with faint transverse veins beneath; panicle up to 15 cm. long, the racemes densely distributed along a central axis, bearing the spikelets upon short (6–10 mm. long) appressed secondary racemes; spikelets lanceolate, 2.5 mm. long; lower glume a short hyaline scale; upper glume and lower lemma as long as the spikelet; upper lemma villous *olivacea*

Entolasia olivacea Stapf in F.T.A. 9: 740 (1920). *APD acc*

Panicum olivaceum Stapf ex A. Chev., Sudania 60, 90 (1911), name only.

Guin.: Ziama (Feb.) Adam 3549 (fide Lebrun in Bull. Soc. Bot. Fr. 116: 370 (1969)).

Extends eastwards through Chad and Cameroun to Congo.

90. PASPALUM

Linn., Syst. Nat. ed. 10, 2: 855 (1759); F.T.A. 9: 568 (1919).

- 1 Spikelets with a ciliate fringe from the margins of the upper glume:2
Spikelets glabrous or minutely pubescent, without a ciliate fringe:4
- 2 Plants stoloniferous; spikelets orbicular, greenish yellow, 1.5 mm. long, closely appressed to the rachis of paired slender racemes; basal leaf-sheaths flattened *L. conjugatum*

- Plants caespitose; spikelets 2–4 mm. long, green to brownish:**3**
- 3** Racemes 3–5; spikelets ovate, acute, 3–4 mm. long [2. dilatatum](#)
- Racemes 10–18, from a long main axis; spikelets elliptic, 2–3 mm. long [3. urvillei](#)
- 4** Spikelets oblong-ovate, acute, rather flattened, 3–3.5 mm. long, glabrous; racemes usually paired, up to 5 cm. long; leaf-blades linear, acute, up to about 10 cm. long, the sheaths imbricate [4. vaginatum](#)
- Spikelets orbicular to broadly elliptic, conspicuously plano-convex:**5**
- 5** Spikelets minutely pubescent, dark brown, 1.5 mm. long; racemes 20–30, fastigate [5. paniculatum](#)
- Spikelets quite glabrous:**6**
- 6** Leaf-blades linear-lanceolate, more or less rounded at the base, up to 20 mm. broad and 10–20 cm. long; spikelets 2.5–3 mm. long; racemes 3–4(-10), up to 7 cm. long [6. auriculatum](#)
- Leaf-blades linear, not rounded at the base, up to 12 mm. broad; spikelets 1.8–2.5 mm. long, rarely more:**7**
- 7** Racemes 1–5, rarely more, the longest up to about 8 cm. long; stems slender, 1–3 mm. diam. at the base, usually tufted, rarely with thin stolons or roots from the lower nodes; basal sheaths glabrous or pilose [7. orbiculare](#)
- Racemes 3–5 the longest over 8 cm. long, or more numerous; stems stout, 3–7 mm. diam. at the base, rooting at the lower nodes; basal sheaths nearly always glabrous [8. polystachyum](#)

1. *Paspalum conjugatum* Berg. in Act. Helv. Phys. Math. 7: 129, t. 8 (1772); F.T.A. 9: 569; Chev. Bot. 722, and in Rev. Bot. Appliq. 13: 889. *APD acc*

Paspalum africanum Poir. (1816).

Creeping perennial up to about 60 cm. high, sometimes more; [open places in forests](#).

Old World tropics generally.

[A very variable species in which the customary division between *P. orbiculare* and *P. commersonii* (see Jansen in Reinwardtia 2: 319 (1953)) breaks down in W. Africa. It probably represents a swarm of apomictic segregates with as many subdivisions as one cares to find characters, and I have deemed it best to treat the species in a wide sense. The closely allied *P. scrobiculatum* Linn. is an annual crop plant from India.]

8. *Paspalum polystachyum* R. Br. Prod. Fl. Nov. Holl. 188 (1810).

APD: *Synonym of Paspalum scrobiculatum* L. var. *scrobiculatum*

APD: *Synonym of Paspalum scrobiculatum* L.

Paspalum scrobiculatum var. *polystachyum* (R. Br.) Stapf in F.T.A. 9: 576 (1919); F.W.T.A., ed. 1, 2: 561; Chev. Bot. 723, and in Rev. Bot. Appliq. 13: 890.

A very variable grass, distinguished (perhaps arbitrarily) from *P. orbiculare* by its robust habit with large inflorescences and stout stems rooting at the nodes, but there are many intermediate forms; **wet places**.

Gam.: Ruxton 88! Wallikunda (Sept.) Macluskie 16! 29! **Mali:** Nafadie (Oct.) Chev. 2250! Banguita (Sept.) Farrow 44! Dari (Sept.) Farrow 45! **Guin.:** Kouroussa (Aug.) Pobéguin 487! Throughout tropical Africa.

92. ACRITOCOAETE

Pilger in Engl., Bot. Jahrb. 32: 53 (1903); F.T.A. 9: 481 (1919). *APD acc*

- 1 Leaf-blades narrowly lanceolate, sparsely pilose, narrowed at the base, drawn out into a filiform tip; inflorescence of 1–4 slender racemes appressed to the main axis; spikelets secund, lanceolate, 6 mm. long, on pedicels 2 mm. long; lower glume an ovate scale 1 mm. long; upper glume and lower lemma hispidulous, with a few scattered bristles *volkensii*

Acritochaete volkensii Pilger in Engl., Bot. Jahrb. 32: 53 (1903). *APD acc*

Perennial, with weak trailing culms up to 1 m. long; **mountains.**

N. Nig.: Chappal Waddi, Sardauna Prov. (Nov.) Magaji, Jackson & Tuley 1968! **W. Cam.:** Cam. Mt., 6,000 ft. (Dec.) Hinds C65! Mokanda, 6,000 ft. (Feb.) Maitland 1339! Mann's Spring, 7,000–7,500 ft. (Dec.) Boughey GC 10716! GC 12623!

Also on the mountains of east and north-east Africa.

93. ALLOTEROPSIS

J. S. Presl. ex C. B. Presl, Rel. Haenk. 343 (1830); emend. Hitchc. in Contrib. U.S. Nat. Herb. 12: 210 (1909); F.T.A. 9: 482 (1919); Butzin in Willdenowia 5: 123 (1968). *APD acc*

- 1 Leaf-blades linear, narrow at the base:2
 Leaf-blades lanceolate, rounded-cordate at the base; basal sheaths pubescent:3

- 2 Spikelets 5–7 mm. long; upper lemma with an awn 3 mm. long; basal sheaths silky hairy; racemes 2–5, digitate; margins of upper glume ciliate, and sometimes extended into a broad fimbriate wing; lower lemma sometimes transversely barred with purple bands [1. *semialata*](#)
- Spikelets 3–4 mm. long; upper lemma mucronate; basal sheaths at most pubescent; racemes 2(–3); margins of upper glume shortly ciliate [2. *angusta*](#)
- 3 Spikelets lanceolate, 3.5–4 mm. long; upper glume with a narrow fringe of short appressed hairs along the margins, and tipped with an awn-point up to 1 mm. long; upper lemma with an awn 3–5 mm. long; margins of leaf-blades cartilaginous and crisped-wavy, usually glabrous; racemes 10–20, in 2 or more whorls [3. *paniculata*](#)
- Spikelets ovate, 4 mm. long; upper glume with a dense conspicuous band of sub-appressed hairs along the margins, and tipped with an awn point up to 1 mm. long; upper lemma with an awn 2–5 mm. long; margins of leaf-blades cartilaginous and pectinate-ciliate; racemes 5–10, in 1–2 whorls [4. *cimicina*](#)

1. **Alloteropsis semialata** (*R. Br.*) Hitchc. in Contrib. U.S. Nat. Herb. 12: 210 (1909); F.T.A. 9: 483; A. Chev. in Rev. Bot. Appliq. 13: 883. *APD acc*

94. DIGITARIA

Heist. ex Fabric., Enum. Pl. Hort. Helmst. 207 (1759); F.T.A. 9: 422 (1919); Henrard, Monograph of the genus *Digitaria* (1950).

- 1 Pedicel tips bearing white setulae as long as the spikelets, the latter quite glabrous; lower glume suppressed, the upper reduced to a small scale and exposing much of the chestnut-brown upper lemma; lower lemma 3-nerved: **2**
- Pedicel tips glabrous or hispidulous: **3**
- 2 Perennial, with densely silky base; spikelets 1.7–2.1 mm. long, the upper glume distinct and up to 0.5 mm. long [1a. diagonalis var. hirsuta](#)
- Annual; spikelets 0.7–1 mm. long, the upper glume represented by a minute scale [2. minutiflora](#)
- 3 Racemes in a succession of 6 or more whorls on a slender common axis about 20 cm. long, the whorls each of 10–12 racemes; raceme rhachis triquetrous, 3–5 cm. long; spikelets 1.8 mm. long; upper glume 3-nerved, as long as the spikelet; leaf-blades lanceolate from a broad subcordate base [3. perrottetii](#)
- Racemes digitate or subdigitate, sometimes with an elongated common axis but then with the racemes longer than the axis and few in number: **4**
- 4 Upper glume shorter than the lower lemma, 3-nerved, the back of the upper lemma partly exposed: **5**
- Upper glume as long as the lower lemma, 5- or rarely 3-nerved, concealing the back of the upper lemma: **17**
- 5 Base of culms densely coated with fibrous remains of leaf-sheaths; rhachis triquetrous, without wings; spikelets clothed in fine pale brown hairs; fruit dark chestnut brown: **6**
- Base of culms not fibrous: **7**
- 6 Spikelets 2–2.5 mm. long [4. homblei](#)
- Spikelets 3–3.5 mm. long [5a. phaeotricha var. patens](#)
- 7 Upper lemma with an awn-point 1.3 mm. long; spikelets 1.7 mm. long, obscurely puberulous with verrucose hairs; racemes digitate, 2–4 cm. long, the rhachis flat and herbaceous with a low rounded midrib [6. aristulata](#)
- Upper lemma acute or acuminate, but not aristulate: **8**
- 8 Spikelets ternate in the middle part of the raceme (sometimes the longest pedicel is partly adnate to the midrib and the spikelets appear to be alternately paired and solitary, or the lowest spikelet is aborted): **9**
- Spikelets paired in the middle part of the raceme; midrib of rhachis triquetrous and usually winged: **13**
- 9 Rhachis of racemes triquetrous, without lateral wings: **10**
- Rhachis of racemes flat, laterally winged, the wings about the same width as the rounded or triquetrous midrib: **11**
- 10 Hairs of spikelets usually short, appressed-clavate with acute tips, not mixed with stout bristles; spikelets 1.7–2.2 mm. long; fruit black [7. delicatula](#)
- Hairs of spikelets mixed with stiff glistening bristles; spikelets 1.8–2 mm. long; fruit black [8. lecardii](#)
- 11 Perennial; tips of pedicels glabrous; spikelets 2–2.2 mm. long, obscurely hairy with oppressed truncate hairs; upper glume obtuse, about 1/2 as long as spikelet; fruit light chestnut brown [9. seminuda](#)
- Annuals; tips of pedicels with a corona of short hairs up to 0.3 mm. long: **12**
- 12 Spikelets with dense lines of short appressed hairs between the nerves, the hairs clavate with obtuse tips; spikelets 1.8–2 mm. long; upper glume acute, 3/4 as long as spikelet; fruit black [10. ternata](#)
- Spikelets quite glabrous, 2 mm. long, dark brown to black, the 3 central nerves of the lower lemma close together; midrib of rhachis triquetrous [11. iburua](#)
- 13 Lower lemma apparently 3-nerved in face view (actually 5-nerved, with the lateral nerves contiguous); spikelets 3 mm. long, narrowly lanceolate; midrib of rhachis triquetrous, 3-winged; fruit yellowish-brown [12. timorensis](#)
- Lower lemma 5-nerved on the face, the nerves spaced: **14**
- 14 Spikelets acuminate at the tip, 3–4 mm. long, with or without stiff brown bristle-hairs along the margins of the lower lemma; racemes 15–25 cm. long, stiff, straight; fruit bluish-grey [13. acuminatissima](#)
- Spikelets acute at the tip, up to 3 mm. long: **15**
- 15 Spikelets quite glabrous, 1.8–2 mm. long, about 3 times as long as broad; racemes triquetrous, scarcely winged, 3–6 cm. long on a short common axis up to 3 cm. long, spreading almost horizontally, the spikelets borne rather laxly on one side; lower glume a green ovate scale 0.3 mm. long; upper glume 2/3–3/4 as long as the spikelet; fruit bluish grey [14. abyssinica](#)
- Spikelets hairy, though often obscurely so, very rarely glabrous; racemes narrowly winged, the spikelets appressed; lower glume varying from an obscure rim to a distinct scale: **16**

- 16** Spikelets 3 times as long as broad, mostly 2–2.3 mm. long; racemes 5–11 cm. long, digitate, stiffly ascending; spikelets imbricate, overlapping by at least half their own length; upper glume usually half as long as the spikelet or more; pedicelled spikelet often with a rufous ciliate fringe at maturity [15. ciliaris](#)
- Spikelets 5 times as long as broad, mostly 2–2.5 mm. long; racemes 8–14 cm. long, digitate or more often on a common axis up to 6 cm. long, more or less spreading; spikelets less dense, overlapping by less than half their length at least in parts of the raceme; upper glume usually less than half as long as the spikelet; pedicelled spikelet without a conspicuous ciliate fringe [16. horizontalis](#)
- 17** Rhachis of racemes flat, ribbon-like, with a low rounded midrib: **18**
- Rhachis of racemes triquetrous, sometimes narrowly winged but then the spikelets attached to a sharp-edged midrib: **21**
- 18** Spikelets pubescent or hirsute with verrucose hairs: **19**
- Spikelets quite glabrous: **20**
- 19** Spikelets 2 mm. long, clothed in fleecy white hairs drawn out into a tuft about 1 mm. beyond the end of the spikelet; lower lemma with a prominent glabrous middle nerve; racemes paired, 8–15 cm. long [17. argyrotricha](#)
- Spikelets 1.2–1.5 mm. long, with short appressed hairs not extending beyond the spikelet; racemes typically paired, 2–5 cm. long [18. longiflora](#)
- 20** Plant creeping, up to about 20 cm. high; spikelets 1.5 mm. long; racemes typically paired, 2–6 cm. long; fruit light brown, the tip distinctly protruding beyond the lower lemma [19. fuscescens](#)
- Plant geniculately ascending, 40–80 cm. high; spikelets 1.7–2 mm. long; racemes 3–5, 4–15 cm. long; fruit bluish grey, not exceeding the lower lemma [20. exilis](#)
- 21** Spikelets densely clothed in long silvery or purplish hairs produced into a long tuft 3–4 mm. beyond the end of the spikelet; spikelets 3–4 mm. long, ternate; lower glume a truncate, nerveless, hyaline scale 0.75 mm. long; upper glume 3-nerved; upper lemma acuminate, rostrate [21. gayana](#)
- Spikelets glabrous or hairy, the hairs not extending beyond the tip of the spikelet; spikelets paired: **22**
- 22** Upper glume 0.5 mm. longer than the lower lemma, caudate-acuminate at the tip, 7-nerved; spikelets 2.5–3 mm. long, narrowly lanceolate, obscurely puberulous; lower glume a membranous collar separated from the rest of the spikelet by a distinct internode 0.1–0.2 mm. long [22. debilis](#)
- Upper glume and lower lemma subequal, acute: **23**
- 23** Lower glume a broad truncate scale, 1/4–1/3 the length of the spikelet, with a snow white fringe of hairs protruding from underneath; spikelets 3 mm. long, pubescent with verrucose hairs [23. patagiata](#)
- Lower glume an obscure glabrous rim at the base of the spikelet: **24**
- 24** Spikelets 3.7–4 mm. long, minutely pubescent; upper glume 3-nerved [24. gentilis](#)
- Spikelets 1.7–2.2 mm. long: **25**
- 25** Spikelets appressed-pubescent, the hairs very fine with curled tips, 1.6–2 mm. long; upper glume 5-nerved; fruit greyish purple [25. leptorhachis](#)
- Spikelets quite glabrous, 2–2.2 mm. long; upper glume 3–5-nerved; fruit grey [26. barbinodis](#)

1. *Digitaria diagonalis* (Nees) Stapf in Fl. Capensis 7: 381 (1898). *APD acc*

Panicum diagonale Nees, Fl. Afr. Austr. 23 (1841).

P. uniglume Hochst. ex A. Rich., Tent. Fl. Abyss. 2: 370 (1851).

Digitaria uniglumis (Hochst. ex A. Rich.) Stapf in F.T.A. 9: 474 (1919).

Throughout tropical and S. Africa, extending eastwards through India to Thailand and China.

11. **Digitaria iburua** *Stapf* in *Kew Bull.* 1915: 382 (1915); F.T.A. 9: 455; *Henr. l.c.* 338; Portères in *J. Agric. Trop.* 2: 359; A. Chev. in *Rev. Bot. Appliq.* 13: 881. *APD acc*

Annual crop plant up to about 1.4 m. high.

Iv. C.: Azaguié (Oct.) Aké Assi 10331! **Togo Rep.:** Kandé, Kpessedé, Ataloté (fide Portères). **Dah.:** Birni to Natitingou (fide Portères). **N. Nig.:** Zaria (Sept.) Lamb 54! Jos (Oct., Nov.) Hepper 2867! Keay FHI 21429! Riyom (Nov.) Philcox 1011! 1012!

12. **Digitaria timorensis** (*Kunth*) *Bal.* in *Morot, Journ. de Bot.* 4: 138 (1890); *Henr. l.c.* 745.

APD: Synonym of Digitaria radicata (J. Presl) Miq.

Panicum timorense *Kunth*, *Enum. Pl.* 1: 83 (1833).

Slender creeping annual about 23 cm. high, probably introduced.

W. Cam.: Buea (July) Maitland 2!

Also in **Mauritius**, and extending eastwards from India to Malesia and Polynesia.

13. **Digitaria acuminatissima** Stapf in F.T.A. 9: 441 (1919); **Henr. l.c.** 4 (incl. var. *conformis* **Henr.** and var. *typica* subvar. *grandiflora* **Henr.**); **A. Chev.** in *Rev. Bot. Appliq.* 13: 880; **Berhaut**, *Fl. Sén. ed.* 2, 400. *APD acc*

Digitaria sanguinalis var. *subacuminata* **A. Chev.**, *Sudania* 30, 33 (1911); **Chev. Bot.** 732; name only.

Annual 60–90 cm. high with long stiff racemes; **on riverside flats subject to seasonal flooding.**

Maur.: L. Rkiz (Oct.) Adam 21818! **Mali:** Goundam to Faginbirg (Aug.) **Chev.** 2284! **San** (Sept.) **Chev.** 2218! **Mopti** (Sept.) **Chev.** 24957! **Gao** (Aug.) de Wailly 5132! **Ghana:** Pong-Tamale (June) Addei 757! **Ningo Mt.** (July) Hall 3148! **Amedica** (Aug.) Hall 3301! **Lawra** (Sept.) Hall CC 772! **N. Nig.:** Lokoja (Mar.) Maggs OK49! **Abinsi** (May) Dalz. 907! **Nguru** (July) Golding 42! **Sokoto** (Sept.) De Leeuw 1556! **Bornu** (Oct.) De Leeuw 2045!

Extends southward to the Congo and **Angola**.

14. **Digitaria abyssinica** (**Hochst. ex A. Rich.**) Stapf in *Kew Bull.* 1907: 213; **F.T.A.** 9: 460; **Henr. l.c.** 1.

APD: Synonym of Digitaria scalarum (Schweinf.) Chiov.

Panicum abyssinicum **Hochst. ex A. Rich.**, *Tent. Fl. Abyss.* 2: 360 (1851).

A slender creeping perennial with culms up to about 30 cm. high.

N. Nig.: Gembu, Mambila Plateau (Jan., Sept., Nov.) Hepper 1841! **Oche MRK** 81! **Magaji & Tuley** 1849! **Mayo Daga** to **Njawai** (Nov.) **Jackson**, **Magaji & Tuley** 1892! **S. Nig.:** Obudu Plateau (Nov.) **Tuley** 1032! **W. Cam.:** **Bambui** (May) **Pedder** 24! **Ndop** (Apr.) **Brunt** 374! **Nkambe** (Feb.) **Hepper & Charter** 1936! **Bamenda** to **Santa Akpabla GC** 10562! **Buea** (Mar.) **Boughey GC** 7018!

Also in east Africa from **Ethiopia** to Tanzania.

15. **Digitaria ciliaris** (**Retz.**) **Koel.** *Descr. Gram.* 27 (1802). *APD acc*

APD: Synonym of Digitaria abyssinica (Hochst. ex A. Rich.) Stapf

Panicum ciliare **Retz.**, *Obs. Bot.* 4: 16 (1786).

P. adscendens **Kunth** in *Humb. & Bonpl., Nov. Gen. et Sp. Pl.* 1: 97 (1816).

Digitaria adscendens (**Kunth**) **Henr.** in *Blumea* 1: 92 (1934); **Henr.**, *Monogr. Digitaria* 9 & 998 (incl. subsp. *chrysoblephora* (**Fig. & De Not.**) **Henr.**, subsp. *marginata* (**Link**) **Henr.** and var. *rhachisetata* **Henr.**); **De Miré & Gillet** in *J. Agric. Trop.* 3: 731.

Digitaria marginata **Link** (1821); **F.T.A.** 9: 439 (incl. var. *linkii* **Stapf**, anii var. *fimbriata* (**Link**) **Stapf**; **A. Chev.** in *Rev. Bot. Appliq.* 13: 879; **Aké Assi**, *Contrib.* 2: 295.

Digitaria sanguinalis of **Chev. Bot.** 732, not of **Scop.** [this closely allied species of temperate regions has shorter spikelets and upper glumes, see **Ebinger** in *Brittonia* 14: 248 (1962)].

Creeping or ascending annual up to about 60 cm. high; **common on roadsides, old farmland, and waste ground.**

Maur.: **Néma Rossetti** 61/173! **Rosso** (Oct.) **Hepper** 3820! **Sen.:** **Ziguinchor** (Jan.) **Chev.** 2188 bis! **Dakar** (May, Oct.) **Baldwin** 5740! **Adam** 14929! **Diégoune** (Sept.) **Adam** 18064! **Sefa** (Oct.) **Adam** 18427! **Gam.:** **Saunders** 26! **Ruxton** 59! **Yundum** (Aug., Dec.) **Frith** 17! 126! **Mandingo Pirie** 1a! **Mali:** **Macina** (Sept.) **Chev.** 24884! **Bamba** (Mar.) **Chev.** 43813! **Timbuktu** (July, Aug.) **Hagerup** 207! **Lean** 66! **Dioura** (Aug.) **Davey** 62! **Port. Throughout the tropics.

[This and the following species are closely related and are both variable. The most reliable distinguishing features are the shape and disposition of the spikelets and the attitude of the racemes, features which, unfortunately, are difficult to describe in words.]

16. *Digitaria horizontalis* Willd. Enum. Hort. Berol. 92 (1809); F.T.A. 9: 436; Henr. l.c. 329; Chev. Bot. 732, and in Rev. Bot. Appliq. 13: 879. *APD acc*

Digitaria horizontalis var. *porrantha* (Steud.) Henr. ex Hubbard & Vaughan, The grasses of Mauritius and Rodriguez 88 (1940); Henr., Monogr. Digitaria 333.

Panicum porranthum Steud. (1854)—Chev. Bot. 728.

P. diamesum Steud. (1854).

Digitaria diamesum (Steud.) Henr. l.c. 177 (1950).

Digitaria reflexa Schumach. (1827)—Henr. l.c. 621.

Digitaria nuda Schumach. (1827)—Henr. l.c. 500.

Digitaria velutina of F.W.T.A., ed. 1, 2: 567; and of Berhaut, Fl. Sén. ed. 2, 400. (This closely allied species is confined to East Africa.)

Creeping or ascending annual 30–60 cm. high; waste places.

Sen.: Perrottet 909! Kafountine (Sept.) Adam 18174! **Gam.:** Sankuli-Kunda (Sept.) Pirie 8! Yundum Ashrif 33! **Port. G.:** Piche (Sept.) Pereira 3174! **Guin.:** Baffing R. Pobéguin 1705bis! Also in the **Congo**.

26. **Digitaria barbinodis** *Henr.* l.c. 67 (1950). *APD acc*

Mali: Chev. 43090! **N. Nig.:** Kwakwi, Plateau (Nov.) Philcox 1005 [mixed with *D. exilis*]! Rahoss, Riyom (Nov.) Philcox 1013 [mixed with *D. iburua*]!

95. RHYNCHELYTRUM

Nees in Lindley, Nat. Syst. ed. 2, 446 (1836); F.T.A. 9: 869 (1930).

- 1 Lower glume up to 3 mm. long, separated from the rest of the spikelet by a conspicuous internode nearly 1 mm. long; spikelets 5–12 mm. long; upper glume and lower lemma shortly and obtusely bilobed, awned or awnless, the former conspicuously gibbous, tapering above into a narrow glabrous beak [1. villosum](#)

Lower glume about 1 mm. long, separated from the upper by a short internode up to 0.3 mm. long: **2**

- 2 Palea of lower floret ciliate on the keels; upper glume and lower lemma bilobed or emarginate, shortly awned, gibbous and clothed in silky hairs below, narrowing above into a glabrous beak a quarter to a half the length of the spikelet; spikelets 2.5–6 mm. long [2. repens](#)

Palea of lower floret glabrous on the keels; upper glume and lower lemma bilobed and awned, more or less straight on the back and not narrowed into a beak, hairy on keel and margins or margins only, otherwise glabrous; spikelets 4–6 mm. long [3. bellespicatum](#)

1. **Rhynchelytrum villosum** (*Parl.*) *Chiov.* in Ann. Ist. Bot. Roma 8: 310 (1908).

APD: *Synonym of Melinis repens subsp. grandiflora* (*Hochst.*) *Zizka*

Monachyrion villosum *Parl.* in Hook., Fl. Nigrit. 191 (1849).

Annual or short-lived perennial, 45–100 cm. high. The size of the spikelets is remarkably variable.

Ghana: Zabzugu (Apr.) Morton GC 9065! Kumasi (May) Darko 5568! **Niger:** Aïr (fide De Miré & Gillet in J. Agric. Trop. 3: 735).

Also in the **Cape Verde Is.**, most of tropical Africa outside our area, **Madagascar**, **Arabia** and **India**.

2. **Rhynchelytrum repens** (*Willd.*) *C. E. Hubbard* in Kew Bull. 1934: 110.

APD: Synonym of Melinis repens (Willd.) Zizka subsp. repens

APD: Synonym of Melinis repens (Willd.) Zizka

Saccharum repens Willd., Sp. Pl. 1: 322 (1798).

Tricholaena repens (Willd.) Hitchc. in U.S. Dept. Agric. Misc. Pub. No. 243: 331 (1936).

T. sphacelata Benth. (1849).

T. rosea Nees (1835)—Chev. Bot. 733.

Rhynchelytrum roseum (Nees) Stapf & C. E. Hubbard ex Bews (1929)—F.T.A. 9: 880; A. Chev. in Rev. Bot. Appliq. 14: 33.

Melinis argentea Mez (1921).

M. brachyrhynchus Mez (1921).

Annual 60–90 cm. high; panicles fluffy, silvery white to pink. **A weed of old farmland.**

Throughout tropical Africa, and introduced to most other tropical countries. (See Useful Plants.)

3. *Rhynchelytrum bellespicatum* (Rendle) Stapf & C. E. Hubbard in F.T.A. 9: 900 (1930).

APD: Synonym of Melinis longiseta subsp. bellespicata (Rendle) Zizka

Tricholaena bellespicata Rendle in Cat. Welw. 2: 196 (1899).

About 30 cm. high.

N. Nig.: Jos (July, Oct.) Blair Rains! De Leeuw 1624a! Naraguta F.R. (July) Lawlor & Hall FHI 45574!

Also in **Angola** and **Malawi**.

96. TRICHOLAENA

Schrad. in Roem. & Schult., Syst. Veg. 2, Mant. 163 (1824); F.T.A. 9: 908 (1930).

- 1 Spikelets 1.7–2.2 mm. long; lower glume a minute hyaline rim; upper lemma glabrescent to pubescent on the margins; panicle loose, up to 15 cm. long *monachne*

Tricholaena monachne (Trin.) Stapf & C. E. Hubbard in F.T.A. 9: 909 (1930); A. Chev. in Rev. Bot. Appliq. 14: 33. *APD acc*

Panicum monachne Trin. in Spreng., Neue Entd. 2: 86 (1821).

Xylochlaena monachne (Trin.) Stapf (1922).

Tricholaena delicatula Stapf & C. E. Hubbard in F.T.A. 9: 911 (1930); F.W.T.A., ed. 1, 2: 569.

Tricholaena bicolor (Schumach.) C. E. Hubbard in F.T.A. 10: 88 (1937).

Aira bicolor Schumach., Beskr. Guin. Pl. 65 (1827).

Decumbent perennial 30–60 cm. high, rooting at the lower nodes; **seashore sands, often drenched by salt spray.**

Ghana: Saltpond (Oct.) Baldwin 13614! Labadi (Mar.) Deighton 574! Teshi (Nov.) Irvine 803! Tema (June) Rose Innes GC 30360! Nungua (June) Rose Innes GC 30079!

Tropical Africa, S. Africa and **Mascarene Islands**, mostly on the coast but also from some inland stations.

97. MELINIS

P. Beauv., Ess. Agrost. 54 (1812); F.T.A. 9: 916 (1930).

- 1 Spikelets deeply grooved between the prominent nerves, glabrous; leaf-blades linear, softly pilose with sticky hairs; panicle narrow, compact; upper lemma usually long awned, but sometimes with the awn short or absent
1. minutiflora.....2
.....@
- Spikelets not grooved, finely nerved:3
- 2 Pedicels scaberulous, without long hairs; lower glume an ovate scale 0.2–0.3 mm. long*1a. minutiflora var. minutiflora*
Pedicels bearing a few white hairs towards the apex; lower glume a scarious rim up to 0.1 mm. long*1b. minutiflora var. setigera*
- 3 Pedicels without long hairs, scaberulous; leaf-blades linear, sparsely pilose with sticky hairs; panicle rather dense with short pedicels; spikelets usually glabrous; lower glume reduced to an obscure rim; upper glume 7-nerved, distinctly bilobed with denticulate lobes; lower lemma with long conspicuous awn, bifid for 1/4 of its length, the lobes acute*2. macrochaeta*
Pedicels bearing long white hairs towards the apex; leaf-blades linear-lanceolate, not sticky, glabrous to softly pubescent; spikelets puberulous to sparsely hairy; upper glume truncate or obscurely lobed; lower lemma shortly bilobed, usually awned:4
- 4 Lower glume reduced to an obscure rim; panicle delicate, open, with capillary branchlets; pedicels smooth between the bristles; upper glume 5-nerved*3. tenuissima*
Lower glume a tiny ovate scale 0.25 mm. long; panicle moderately dense, the branches ascending; pedicels scaberulous; upper glume 7-nerved*4. effusa*

1. **Melinis minutiflora** *P. Beauv.* Ess. Agrost. 54, t. 11, f. 4 (1812); F.T.A. 9: 931; Chev. Bot. 722, and in Rev. Bot. Appliq. 14: 34; including var. *inermis* Rendle, Cat. Welw. 2: 200 (1899), and var. *mutica* Hack. in Sitz. Acad. Wiss. Wien. 89: 126 (1884); Berhaut, Fl. Sén. ed. 2, 419. *APD acc*

Perennial, erect or ascending from a prostrate base, the culms up to 2 m. long; leaves covered in sticky hairs and smelling strongly of molasses or linseed oil.

1a. **Melinis minutiflora var. minutiflora** *APD acc*

Guin.: Dalaba (Nov.) Chev. 31900! Kindia Jac.-Fél. 237! *S. L.*: Pujehun (Dec.) Deighton 256! Bintumane (Nov., Jan.) Glanville 332! 478! T. S. Jones 111! Mt. Loma (Nov.) Also in **Congo** and **Angola**.

Specimens from Guinée have the lower lemma ciliate at the tip.

3. *Anthephora hochstetteri* Nees in Flora 27: 249 (1844); F.T.A. 9: 944.

APD: *Synonym of Anthephora pubescens* Nees

Tufted, glaucous perennial up to 1 m. high.

Mali: Kidal (Sept.) Rossetti 59/152!

Extends eastwards to **Kenya**, **Uganda**, **Sudan**, **Ethiopia** and **Somalia**.

4. *Anthephora nigritana* Stapf & C. E. Hubbard in F.T.A. 9: 937 (1930). *APD acc*

Perennial, up to 75 cm. high.

Niger: Toukounous Bartha 46! **N. Nig.**: Nupe Barter 1380! Sokoto (July) Dalz. 507! Kano (July, Nov.) Onwudinjoh FHI 22384a! Taylor 6! Katagum Dalz. 260!

Also in the **Sudan**.

99. PARATHERIA

Griseb., Cat. Pl. Cuba. 236 (1866); F.T.A. 9: 1084 (1934).

- 1 Nodes bearded; leaf-blades glabrous or pubescent; branches of the inflorescence and bristles scabrid; peduncles 2–5 mm. long; bristles (15–)25–40 mm. long; spikelets (6–)10–12 mm. long, glabrous except for a little tuft of hair surrounding the base; glumes ovate, obtuse, 1–2 mm. long *l. prostrata*

Nodes glabrous; leaf-blades glabrous; branches of the inflorescence and bristles quite smooth; peduncles 10–15 mm. long; bristles 15–25 mm. long; spikelets 10–12 mm. long, glabrous; glumes ovate, acute, 2–3 mm. long *glaberrima*

1. *Paratheria prostrata* Griseb. Cat. Pl. Cuba 236 (1866); F.T.A. 9: 1085; Berhaut, Fl. Sén. ed. 2, 396.

APD acc

Prostrate perennial, growing in water; cleistogamous spikelets, resembling normal spikelets except for the absence of the bristle, occur at the base of the raceme and also in the uppermost leaf-sheaths.

Sen.: Oussouye (Apr.) Berhaut 5835! **Guin.**: Soumbalako Maounde (June) Adames 280! **S. L.**: Njala (May, July) Deighton 704! 737! Mabum (Aug.) Thomas 1515! Luti (July) Jordan 283! Rosino (July) Jordan 43! **U. Volta**: Banfora (July) Adjanohoun 192a! **S. Nig.**: Yaba (June) Dalz. 1423!

Also in the **Congo**, **Zambia**, **SW. Africa**, **Madagascar** and **tropical America**.

2. *Paratheria glaberrima* C. E. Hubbard in Kew Bull. 4: 365 (1949). *APD acc*

Prostrate perennial, **growing in water**; cleistogamous spikelets as in preceding species.

S. L.: Luti (July) Deighton 4337!

100. BECKEROPSIS

Fig. & De Not. in Mem. Acad. Sci. Torino ser. 2, 14: 365 (1854); F.T.A. 9: 948 (1934); Clayton in Hook., Ic. Pl. 37: t. 3643 (1967). *APD acc*

- 1 Perennial; leaf-blades firm, up to 60 cm. long and 20 mm. broad, usually with a slender petiole-like base; apex of leaf-sheath usually bearded with a line of hairs on the abaxial side; raceme rhachis and peduncles pubescent, the spikelets overlapping by 3/4 their own length or more; spikelets acute, 2.5–3 mm. long; glumes subequal, up to 0.5 long; lower lemma hispidulous, the upper scaberulous *l. unisetia*

Annual; leaf-blades thin, flaccid, up to 10(–25) cm. long and 6(–14) mm. broad, the lower narrowed into slender filiform false petioles; apex of leaf-sheath without hairs on the abaxial side; raceme rhachis and peduncles scaberulous, spikelets overlapping by 1/2 their own length; spikelets acuminate, mostly 3.5–4 mm. long; glumes subequal, the upper 0.75–1 mm. long; both lemmas spinulose-hispidulous above *l. laxior*

1. **Beckeropsis unisetata** (Nees) K. Schum. in Engl., Pflanzenw. Ost-Afr. B: 52 (1895); F.T.A. 9: 949; A. Chev. in Rev. Bot. Appliq. 14: 34; Berhaut, Fl. Sén. ed. 2, 421.

APD: *Synonym of Pennisetum unisetum* (Nees) Benth.

Gymnothrix unisetata Nees, Fl. Afr. Austr. 66 (1841).

A tall perennial up to 3.5 m. high; in woodland shade.

Also in **E. Cameroun**, **S. Tomé** and **Annobon**.

101. PENNISETUM

L. Rich. in Pers., Syn. Pl. 1: 72 (1805); F.T.A. 9: 954 (1934).

- 1 Inflorescence reduced to a cluster of 2–4 spikelets, subsessile and enclosed in the uppermost leaf-sheath; spikelets 10–20 mm. long; leaf-blades up to about 12 cm. long, subobtuse at the tip [1. clandestinum](#)
- Inflorescence a false spike of numerous spikelets, conspicuously exserted: **2**
- 2 Rhachis angular with sharp-edged decurrent wings below the scars of the fallen involucre, glabrous or at most puberulous (but see *P. pedicellatum*); peduncles deciduous; upper glume as long as the spikelet: **3**
- Rhachis cylindric or with rounded ribs, glabrous or hairy: **8**
- 3 Upper glume and lower lemma acuminate, 6–7 mm. long; upper lemma acuminate, chartaceous, glabrous, not readily separating from the rest of the spikelet; spikelets solitary, sessile; involucre bristles glabrous, in a single whorl, up to 2 cm. long; basal sheaths laterally compressed [2. ramosum](#)
- Upper glume and lower lemma more or less 3-lobed, 2.5–6 mm. long; upper lemma obtuse, thinly coriaceous, ciliate at the apex, readily disarticulating from the rest of the spikelet: **4**
- 4 Spikelets in clusters of 1–5 within the involucre, at least one of the spikelets upon a pedicel 1–3 mm. long; bristles densely woolly plumose, forming a fluffy ovate involucre 0.5–1 cm. long; spikelets 4–6 mm. long; rhachis puberulous, very rarely pubescent [3. pedicellatum](#)
- Spikelets solitary and sessile within the involucre: **5**
- 5 Bristles, or at least the inner ones, plumose in the lower half: **6**
- Bristles glabrous, or the longer obscurely ciliate: **7**
- 6 Spikelets 3–5 mm. long; false spike (6–)8–10(–15) mm. broad, excluding the bristles; longest bristle 15–25 mm. long, the other inner bristles usually more than twice as long as the spikelet, rarely less [4. polystachion](#)

- Spikelets 2.5–3 mm. long; false spike 4–7 mm. broad, excluding the bristles; longest bristle 6–12 mm. long, the other bristles less than twice as long as the spikelet [5. subangustum](#)
- 7 Longest bristle 11–16 mm. long, the others irregularly 2-whorled and up to twice as long as the spikelet or more; spikelets 3–4 mm. long; false spike 7 mm. broad, excluding the bristles [6. atrichum](#)
- Longest bristle 5–6 (- 8) mm. long, the others in 1 whorl of 6–8 and subequal to the spikelet or up to 1 1/2 times as long, rarely longer; spikelets 2.5–3 mm. long; false spike 4–6 mm. broad, excluding the bristles [7. hordeoides](#)
- 8 Plants perennial: **9**
- Plants annual; rhachis pubescent or pilose; anther tips with a tiny tuft of hairs; **15**
- 9 Involucres borne upon a peduncle 1–3 mm. long, and falling with it at maturity; bristles plumose, up to about 3 cm. long; spikelets in clusters of 1–3, 4.5–6.5 mm. long; anther-tips smooth; leaf-blades rigid, about 3 mm. broad, usually convolute or folded [8. setaceum](#)
- Involucres subsessile, or disarticulating from the peduncle at maturity with the latter remaining upon the rhachis; bristles glabrous (sometimes obscurely ciliate in *P. purpureum*): **10**
- 10 Rhachis densely pubescent to loosely pilose; culm pubescent just below spike; bristles unequal: **11**
- Rhachis glabrous or hispidulous; culm glabrous below spike; anther tips glabrous: **12**
- 11 Spikes 14–30 mm. broad (excl. bristles); leaf-blades up to 40 mm. broad; anther tips with a tiny tuft of hairs; rhachis densely pubescent; persistent peduncles obscure, involucres subsessile; spikelets 4–7 mm. long; lower floret variable [9. purpureum](#)
- Spikes 6–9 mm. broad (excl. bristles); leaf-blades up to 10 mm. broad, but usually narrower; anther-tips smooth; rhachis shortly and loosely pilose, at least in the lower part and beneath the spike; persistent peduncles conspicuous, up to 1 mm. long, appressed to the rhachis; spikelets 5 mm. long; lower floret reduced to an empty lemma as long as the spikelet [10. monostigma](#)
- 12 Spikelets 6–7 mm. long; spikes terminal and axillary; lower floret as long as the spikelet, usually barren; leaf-blades up to 20 mm. broad [11. trachyphyllum](#)
- Spikelets 3–5 mm. long; spikes terminal only: **13**
- 13 Terminal bristle of the involucre not much longer than the rest, up to 8 mm. long; lower floret barren, almost as long as the spikelet [12. glaucocladum](#)
- Terminal bristle of the involucre twice as long as the rest, up to 18 mm. long: **14**
- 14 Lower floret male, as long as the spikelet [13. giganteum](#)
- Lower floret barren, and reduced to a lemma 1/2 as long as the spikelet [14. glabrum](#)
- 15 Clusters readily deciduous; grain not exerted from the spikelet; wild grasses or degenerate escapes from cultivation: **16**
- Clusters persistent; grain usually exerted from the gaping spikelet; cultivated plants [19. americanum](#)
- 16 Upper lemma glabrous on the margins, narrowly lanceolate, acuminate, thinly coriaceous, readily deciduous; rhachis slender, more or less flexuous; leaf-blades and sheaths mostly hirsute; involucres 5–10 mm. long, sometimes with 1 bristle up to 8 mm. longer than the rest: **17**
- Upper lemma ciliate on the margins, narrowly ovate, acute, chartaceous, tardily deciduous; rhachis stiff, straight; leaf-blades and sheath mostly glabrous: **18**
- 17 Involucral bristles plumose and fluffy [15. violaceum](#)
- Involucral bristles merely ciliate [16. fallax](#)

- Involucral bristles glabrous [18. dalzielii](#)

1. *Pennisetum clandestinum* Hochst. ex Chiov. in Ann. Ist. Bot. Roma 8: 41 (1903); F.T.A. 9: 1009.

APD: *Synonym of Cenchrus clandestinus* (Hochst. ex Chiov.) Morrone

A creeping perennial with stout stolons forming a dense mat; the silvery filaments of the stamens are conspicuously exerted from the leaf-sheath when in flower.

S. Nig.: Obudu Plateau (Feb., Apr.) Tuley 478! Haines 366! **W. Cam.:** Bafut-Ngemba F.R. (Jan.) Dammola FHI 40629! Bamenda to Bali (Mar.) Brunt 1082! Bambui (June) Brunt 1181!

Introduced in 1948, and now naturalized; native in the E. African highlands, and widely introduced to upland regions throughout the tropics.

2. *Pennisetum ramosum* (Hochst.) Schweinf. Beitr. Fl. Aethiop. 301 (1867); F.T.A. 9: 976.

APD: Synonym of Cenchrus ramosus (Hochst.) Morrone

Gymnothrix ramosa Hochst. in Flora 27: 252 (1844).

Annual, up to 1·2 m. high; on seasonally swampy heavy soils.

N. Nig.: Ngala (Oct.) Gwynne 114! Gumari (Nov.) Davey FHI 27111! Logomani (Nov.) Johnston W74! Biu (Sept.) Kennedy FHI 8001! Kingowa (Oct.) Golding 27!

Extends east to Eritrea, south to **Uganda** and Tanzania. (See Useful Plants.)

3. *Pennisetum pedicellatum* Trin. in Mém. Acad. Sc.i. Petersb. sér. 6, 3: 184 (1834); F.T.A. 9: 1065; Chev. Bot. 736, and in Rev. Bot. Appliq. 14: 38; Berhaut, Fl. Sén. ed. 2, 395; De Miré & Gillet in J. Agric. Trop. 3: 734; incl. var. pubirhachis Berhaut in Mém. Soc. Bot. Fr. 1953–54: 10 (1954), and Pl. Sén. ed. 2, 394 (the variety is distinguished by its pubescent rhachis).

APD: Synonym of Cenchrus pedicellatus (Trin.) Morrone

Pennisetum implicatum Steud. (1854).

Annual up to about 1 m. high, with fluffy white or purple inflorescences; often dominant upon fallow land in the drier savanna.

Maur.: Néma Rossetti 61/249! Nima (Oct.) Hepper 3715! **Sen.:** Farmar 17! Walo (Aug.) Roger 50! Matam (Dec.) Chev. 2262bis! M'Bambey (Nov.) Chev. 33819! Ngazobile (Nov.) Nig.:** Lagos (Sept.) W. MacGregor 1! 51! Tuley 869! Ibadan (May) Latilo FHI 44091!

Also in **E. Cameroun**, and extending eastwards to **Ethiopia**, the **Sudan** and India. (See Useful Plants.)

[This species may hybridize with *P. polystachion*; some specimens have the narrow plumose involucre of the latter but containing a single pedicelled spikelet.]

4. *Pennisetum polystachion* (Linn.) Schult. Syst. Veg. Mant. 2: 146 (1824); F.T.A. 9: 1057; A. Chev. in Rev. Bot. Appliq. 14: 39; Berhaut, Fl. Sén. ed. 2, 395.

APD: Synonym of Cenchrus polystachios (L.) Morrone

Panicum polystachion Linn., Syst. Nat., ed. 10, 2: 870 (1759).

Pennisetum setosum (Sw.) L. Rich. in Pers., Syn. Pl. 1: 72 (1805); Chev. Bot. 736, and in Rev. Bot. Appliq. 14: 38.

Cenchrus setosus Sw., Prodr. Veg. Ind. Occ. 26 (1788).

Panicum cauda-ratti Schumach. (1827).

Pennisetum cauda-ratti (Schumach.) Franch. (1895).

Pennisetum tenuispiculata Steud. (1854)—A. Chev. in Rev. Bot. Appliq. 14: 39.

Pennisetum elegans Nees ex Steud. (1854).

Annual or perennial, 0·3–1·8 m. high, varying greatly in the stiffness and colouring of the inflorescence; common on fallow land and disturbed soils.

Extends south to the Congo; also in **India**.

8. Pennisetum setaceum (Forsk.) Chiov. in Bull. Soc. Bot. Ital. 1923: 113 (1923); F.T.A. 9: 1013.

APD: Synonym of Cenchrus setaceus (Forssk.) Morrone

Phalaris setacea Forsk., Fl. Aegypt.-Arab. 17 (1775).

Pennisetum asperifolium (Desf.) Kunth (1829)—Berhaut, Fl. Sén. ed. 2, 394.

Cenchrus asperifolius Desf. (1800).

Densely tufted perennial with hard glaucous leaf-blades.

Sen.: Heudelot 484 (partly)!

Extends from Tunisia to Israel, thence southwards to Tanzania; also grown as an ornamental.

9. Pennisetum purpureum Schumach. Beskr. Guin. Pl. 44 (1827); F.T.A. 9: 1016; Chev. Bot. 736, and in Rev. Bot. Appliq. 14: 36; Berhaut, Fl. Sén. ed. 2, 394.

APD: Synonym of Cenchrus purpureus (Schumach.) Morrone

Pennisetum benthamii Steud. (1854).

Pennisetum pallescens Leeke (1907).

A robust perennial up to 8 m. high and 2.5 cm. diam. at the base; **commonly occurs near the banks of streams.**

Guin.: Baffing R. (Nov.) Pobéguin 1825! **S. L.:** Talla Hills Sc. Elliot 4936! Kabala (Dec.) Deighton 4410! Tumbu (Oct.) Deighton 3272! Juring (Dec.) Deighton 296! Kamabai (Jan.) Po:** Boughy GC 10795! Mann 1463! Lago Biao, 5,000 ft. (Sept.) Wrigley 672! Pico de Santa Isabel (Mar.) Guinea 2781!

Also in **E. Cameroun**.

11. Pennisetum trachyphyllum Pilger in Engl., Bot. Jahrb. 30: 122 (1901); F.T.A. 9: 967.

APD: Synonym of Cenchrus trachyphyllus (Pilg.) Morrone

Perennial up to 2 m. high.

W. Cam.: Buea (Jan.) Maitland 341! Bamenda (Oct.) Agric. officer Bam/20!

Also in eastern Africa, from the mountains of **Ethiopia** south to Kilimanjaro.

12. Pennisetum glaucocladum Stapf & C. E. Hubbard in Kew Bull. 1933: 276; F.T.A. 9: 984.

APD: Synonym of Pennisetum macrourum Trin.

Stout perennial, 1·2–2·4 m. high; **streamsides**.

N. Nig.: Vom (Apr.) Morton K323!

Also in **Tanzania**, **Zambia**, **Rhodesia**, **Malawi** and **Botswana**.

13. Pennisetum giganteum A. Rich. Tent. Fl. Abyss. 2: 382 (1851); F.T.A. 9: 979.

APD: Synonym of Pennisetum macrourum Trin.

Pennisetum togoense Mez in Engl., Bot. Jahrb. 57: 191 (1921); F.T.A. 9: 988.

Stout perennial up to 5 m. high; **streambanks**.

Guin.: Dabola Jac.-Fél. 550 (fide Mimeur in Rev. Bot. Appliq. 30: 313). **Togo Rep.:** Sokode to Basari Kersting A698! **N. Nig.:** Yankari (Sept.) Magaji & Tuley 1798! Kwagiri, Gashaka (Nov.) Latilo & Daramola FHI 28762! Nguroge (Nov.) Magaji & Tuley 1867! Chappal Waddi, Sardauna Prov. (Nov.) Jackson, Magaji & Tuley 2096!

Extends eastwards to the **Sudan** and **Kenya**.

[P. giganteum belongs to a cluster of poorly differentiated species, mainly from eastern Africa, whose taxonomy requires revision. The name is here used in a wide sense].

14. Pennisetum glabrum Steud. Syn. Pl. Glum. 1: 104 (1854); F.T.A. 9: 995.

APD: Synonym of Pennisetum thunbergii Kunth

Perennial with slender culms 30–90 cm. high; **damp places**.

N. Nig.: Chappal Waddi, Sardauna Prov. (Nov.) Jackson, Magaji & Tuley 2099!

Extends eastwards to the **Sudan** and southwards to **Zambia**.

15. Pennisetum violaceum (Lam.) L. Rich. in Pers., Syn. Pl. 1: 72 (1805); F.T.A. 9: 1027; Berhaut, Fl. Sén. ed. 2, 394; De Miré & Gillet in J. Agric. Trop. 3: 734; incl. vars, chudeaui (Maire) Maire and monodii (Maire) Maire in Fl. Afr. Nord 1: 337 (1952).

APD: Synonym of Cenchrus violaceus (Lam.) Morrone

Panicum violaceum Lam., Illustr. Gen. 1: 169 (1791).

Pennisetum mollissimum Hochst. in Flora 27: 253 (1844); F.T.A. 9: 1022; F.W.T.A., ed. 1, 2: 574; Chev. Bot. 735, and in Rev. Bot. Appliq. 14: 35.

Pennisetum ramosissimum Steud., Syn. Pl. Glum. 1: 105 (1854).

Pennisetum cognatum Steud. l.c. 107.

Pennisetum subeglime Trabut in Bull. Soc. Hist. Nat. Nord Afr. 10: 187 (1919).

Pennisetum molle Hitchc. in Proc. Biol. Soc. Wash. 43: 91 (1930).

Pennisetum chudeaui Maire in Bull. Mus. Hist. Nat. Paris sér.2, 3: 252 (1931); incl. subsp. monodii Maire l.c.; A. Chev. in Rev. Bot. Appliq. 14: 35.

Pennisetum rogeri Stapf & C. E. Hubbard in Kew Bull. 1933: 285; F.T.A. 9: 1023; F.W.T.A., ed. 1, 2: 574; A. Chev. in Rev. Bot. Appliq. 14: 37.

Pennisetum barteri Stapf & C. E. Hubbard in Kew Bull. 1933: 287 (1933); F.T.A. 9: 1026; F.W.T.A., ed. 1, 2: 574.

Logomani, Bornu (Nov.) Johnston N84! Nupe Barter 1376!

Also in **Central African Republic** and **Sudan**. (See Useful Plants.)

16. **Pennisetum fallax** (*Fig. & De Not.*) Stapf & C. E. Hubbard in Kew Bull. 1933: 270; F.T.A. 9: 1019.

APD: *Synonym of Pennisetum violaceum (Lam.) Rich.*

Penicillaria fallax *Fig. & De Not.* in Mem. Accad. Sci. Torino ser. 2, 14: 371 (1854).

Pennisetum ochrops Stapf & C. E. Hubbard in Kew Bull. 1933: 284; F.T.A. 9: 1021; F.W.T.A., ed. 1, 2: 574; A. Chev. in Rev. Bot. Appliq. 14: 38.

Annual weed 60–120 cm. high; perhaps not distinct from the preceding.

Maur.: Néma Rossetti 61/202! **Sen.:** Galam Heudelot 299! M'Bidjem (Aug.) Thierry 66! **N. Nig.:** Gushko, Chad (Oct.) Golding 22!

Also in the **Sudan** and **Eritrea**. (See Useful Plants.)

17. **Pennisetum stenostachyum** (*Klotzsch ex A. Br.*) Stapf & C. E. Hubbard in Kew Bull. 1933: 270; F.T.A. 9: 1031.

APD: *Synonym of Pennisetum polystachion (L.) Schult. subsp. polystachion*

APD: *Synonym of Pennisetum sieberianum (Schltr.) Stapf & C.E. Hubb.*

Penicillaria stenostachya *Klotzsch ex A. Br.* in Ind. Sem. Hort. Berol. 1855 App. 25 (1855).

Pennisetum sclerocladum Stapf & C. E. Hubbard in Kew Bull. 1933: 288; F.T.A. 9: 1033; F.W.T.A., ed. 1, 2: 574.

Pennisetum sampsonii Stapf & C. E. Hubbard l.c. 289; A. Chev. in Rev. Bot. Appliq. 14: 37.

Pennisetum niloticum Stapf & C. E. Hubbard l.c. 293.

Coarse annuals 1–1.5 m. high, **usually in proximity to the cultivated species.**

Sen.: Walo Perrottet 76! Thiès to St. Louis (Nov.) Chev. 2266! St. Louis Roger! Kaolack (Nov.) Adam 19905! **Gam.:** Boteler! Georgetown (Jan.) Sampson 56! **N. Nig.:** Ilorin (Dec.) Sampson 44!

Also in **Egypt** and **Sudan**. (See Useful Plants.)

This taxon is probably no more than an assemblage of worthless segregates from the cultivated plants.

18. **Pennisetum dalzielii** Stapf & C. E. Hubbard in Kew Bull. 1933: 290; F.T.A. 9: 1030.

APD: *Synonym of Pennisetum sieberianum (Schltr.) Stapf & C.E. Hubb.*

N. Nig.: Sokoto Dalz. 511! 512! 513!

Very doubtfully distinct from the preceding.

19. **Pennisetum americanum** (*Linn.*) K. Schum. in Engl., Pflanzenw. Ost-Afr. B: 51 (1895). *APD acc*

Panicum americanum *Linn.*, Sp. Pl. 56 (1753).

Pennisetum typhoides (*Burm.*) Stapf & C. E. Hubbard (1933).

Pennisetum pycnostachyum (*Steud.*) Stapf & C. E. Hubbard (1933); Berhaut, Fl. Sén. ed. 2, 393.

Pennisetum nigritarum (*Schlechtld.*) Dur. & Schinz (1894).

Pennisetum anchylochaete Stapf & C. E. Hubbard (1933).

Pennisetum cinereum Stapf & C. E. Hubbard (1933).

Pennisetum gibbosum Stapf & C. E. Hubbard (1933).

Pennisetum maiwa Stapf & C. E. Hubbard (1933).

Pennisetum gambiense Stapf & C. E. Hubbard (1933); Berhaut, Fl. Sén. ed. 2, 393.

Pennisetum leonis Stapf & C. E. Hubbard (1933).

[Many species of “Bulrush Millet” were accepted in F.T.A. and F.W.T.A. ed. 1. It is becoming apparent, however, that these do not form satisfactory units, either morphologically, genetically or agriculturally. The solution lies in uniting them into a single species, within which cultivars may be recognised according to the provisions of the International Code of Nomenclature for Cultivated Plants.- W.D.C.].

***Pennisetum divisum* (Forsk. ex Gmel.) Henr.** in *Blumea* 2: 162 (1938).

APD: Synonym of Cenchrus ramosissimus Poir.

***Panicum divisum* Forsk. ex Gmel.**, *Syst. Nat.* 2: 156 (1791).

***Pennisetum dichotomum* (Forsk.) Del.** (1813).

A glabrous bushy perennial with stout woody stems; rhachis glabrous, inconspicuously angular; spikelets 7–8 mm. long, the lower glume half as long.

Recorded at Air, Niger, by De Miré & Gillet in *J. Agric. Trop.* 3: 734 (1956).

From N. Africa, [Arabia](#) and India.

Additional species

***Pennisetum villosum* Fresen.** in *Mus. Senck.* 2: 134 (1837).

APD: Synonym of Cenchrus longisetus M. C. Johnst.

***Pennisetum longistylum* Hochst. ex A. Rich.** (1851); *Berhaut, Fl. Sén. ed. 2*, 393.

Perennial, with handsome plumose involucre up to 7 cm. long.

An [Ethiopian](#) species sometimes grown as an ornamental.

Additional species

Imperfectly known species.

***Pennisetum senegalense* Steud. ex Jard.** *Herbor. Côte Occid. Afr.* 10 (1851), name only. *APD acc*

Probably one of the wild annual species growing near Dakar.

Additional species

102. CENCHRUS

Linn., *Sp. Pl.* 1049 (1753), and *Gen. Pl. ed. 5*, 470 (1754); De Lisle in *Iowa State J. Sci.* 37: 259 (1963); *F.T.A.* 9: 1070 (1934).

- 1 Bristles of the involucre retrorsely barbellate and adhering to clothing, rigid, prickly, 4–8 mm. long; outer bristles present: **2**
- Bristles of the involucre antrorsely barbellate, not prickly: **3**
- 2 Bristles connate at the base into a shallow elliptic disc up to about 3 mm. across, but free above the rim of the disc [1. biflorus](#)
- Bristles connate for about half their length to form a deep cup [2. echinatus](#)
- 3 Inner bristles flattened, rigid, 2.5–5 mm. long, ciliate on the inside, with the margins fused for 1/3 of their length above the rim of the basal disc; outer bristles suppressed or reduced to minute points [3. setigerus](#)
- Inner bristles slender, 9 mm. long or more, free above the basal disc; outer bristles numerous: **4**
- 4 Involucral bristles connate for a short distance from the base to form a shallow elliptic disc up to 3 mm. across; inner bristles stiff, subequal, 15–20 mm. long, scantily ciliate in the lower half [4. priouri](#)
- Involucral bristles connate only at the very base to form a disc up to 1 mm. diam.; inner bristles flexible, unequal, one longer than the others, 9–12 mm. long, densely ciliate in the lower half [5. ciliaris](#)

1. *Cenchrus biflorus* Roxb. *Fl. Ind.* 1: 238 (1820); *Berhaut, Fl. Sén. ed. 2*, 393. *APD acc*

***Cenchrus barbatus* Schumach.**, *Beskr. Guin. Pl.* 43 (1827); *F.T.A.* 9: 1079.

***Cenchrus catharticus* Del.** (1839)—*Chev. Bot.* 734, and in *Rev. Bot. Appliq.* 14: 39; De Miré & Gillet in *J. Agric. Trop.* 3: 728.

***Cenchrus leptacanthus* A. Camus** in *Bull. Soc. Bot. Fr.* 80: 774 (1934).

Annual, geniculately ascending, about 60 cm. high; the burrs vary somewhat in size and spinescence, and in a few cases the acicular outer bristles are suppressed simulating *C. setigerus*; [old farmland and waste places](#).

Extending south to Zambia and Rhodesia and east to Eritrea and India. (See Useful Plants.)

2. **Cenchrus echinatus** *Linn. Sp. Pl.* 1050 (1753); *F.T.A.* 9: 1082. *APD acc*

Annual 30–90 cm. high.

Ghana: Cape Coast (May) Hall 3039! Accra (Oct.) Morton! Achimota (Apr.) Ankrah GC 20129! Accra to Aburi (June) Oduro 11! **S. Nig.:** Lagos (Oct.) Haines 183!

A native of tropical America, occurring as an adventive in most tropical countries.

3. **Cenchrus setigerus** *Vahl Enum. Pl.* 2: 395 (1806); *F.T.A.* 9: 1077; Berhaut, *Fl. Sén. ed.* 2, 393; De Miré & Gillet in *J. Agric. Trop.* 3: 729. *APD acc*

Perennial.

Ghana: Legon (Mar.) Morton A4156! Aiyinase (July) Irvine 5060!

Also in **Sudan**, **Ethiopia**, **Kenya**, **Arabia** and **India**, and introduced elsewhere as a fodder plant.

4. **Cenchrus prieuri** (*Kunth*) *Maire* in *Bull. Mus. Hist. Nat. Paris*, ser. 2, 3: 523 (1931); *F.T.A.* 9: 1071; Berhaut, *Fl. Sén. ed.* 2, 395; De Miré & Gillet in *J. Agric. Trop.* 3: 729. *APD acc*

Pennisetum prieuri *Kunth*, *Rev. Gram.* 2: 411 (1831).

P. breviflorum *Steud.* (1854).

Cenchrus macrostachys *Hochst. ex Steud.* (1854)—A. Chev. in *Rev. Bot. Appliq.* 14: 40.

Annual, culms ascending, up to about 75 cm. high.

Maur.: Bafréchié (Sept.) Sadio 235! **Sen.:** Adanson! Roger! Leprieur! **Mali:** Timbuktu (Aug.) Hagerup 277! Lean 67! Dioura (Sept.) Davey 69! Gao (Aug.) de Wailly 4725! Kidal (Sept.) Rossetti 59/168! **Niger:** Air Trabut! Zinder (Nov.) Hagerup 611a! **N. Nig.:** Kafinsoli (Sept.) Butler S107!

Extending eastwards to the **Sudan** and into India. (See Useful Plants.)

5. **Cenchrus ciliaris** *Linn. Mant. Alt.* 302 (1771); *F.T.A.* 9: 1072; Berhaut, *Fl. Sén. ed.* 2, 394; De Miré & Gillet in *J. Agric. Trop.* 3: 729. *APD acc*

Pennisetum ciliare (*Linn.*) *Link* (1827); A. Chev. in *Rev. Bot. Appliq.* 14: 36.

P. cenchroides *Rich.* (1805).

Perennial, culms ascending, up to about 1 in. high; indigenous in the drier areas, but probably introduced in the south where it occurs on rubbish tips, roadsides, etc.

Throughout tropical Africa, extending into the Middle East and India; introduced to many other countries as a fodder grass. (See Useful Plants.)

Cyr., Pl. Rar. Neap. 2: 26 (1792); F.T.A. 9: 87 (1917).

- 1 Culms up to 1.25 m. high, from extensively creeping rhizomes; leaf-blades usually erect, sword-like; inflorescence cylindrical, spiciform, silky, with long white hairs from glumes, pedicels and branches; spikelets paired, both pedicelled, the pedicels unequal; glumes membranous; stamens 2 cylindrical IMPERATA.....2 @
- 2 Leaf-blades narrowly linear, 3–6 mm. broad, involute or convolute, rigid, glaucous; panicles very dense and tightly cylindrical [1a. cylindrica var. cylindrica](#)
 Leaf-blades linear to lanceolate-linear, 4–18 mm. broad, flat, firm; panicles rather less dense [1b. cylindrica var. africana](#)

1. **Imperata cylindrica** (Linn.) P. Beauv. Ess. Agrost. 165, 166 (1812); F.T.A. 9: 87; A. Chev. in Rev. Bot. Appliq. 13: 855; Berhaut, Fl. Sén. ed. 2, 396. *APD acc*

Lagurus cylindricus Linn., Syst. Nat. ed. 10, 878 (1759).

Saccharum cylindricum (Linn.) Lam. (1785).

1a. **Imperata cylindrica var. cylindrica**. *APD acc*

Imperata arundinacea Cyr., Pl. Rar. Neap. 2: 26 (1792).

Imperata arundinacea var. *europaea* Anderss. in Öfvers. K. Vet. Akad. Frh. Stock. 1855: 159 (1856).

Imperata cylindrica var. *europaea* (Anderss.) Asch. & Graeb., Syn. Mitteleurop. Fl. 2: 37 (1898).

N. Nig.: Kworre, Sokoto (Sept.) Palmer 27! Baga Seyoram, Kukuwa Dist. (Feb.) Davey FHI 27174! Kalkala, L. Chad (May) Golding 80!

Extending to Hoggar, shores of the Mediterranean, and eastwards through Iraq, Iran and Afghanistan to southern U.S.S.R. (See Useful Plants.)

1b. **Imperata cylindrica var. africana** (Anderss.) C. E. Hubbard in Imp. Agric. Bur., Joint Pub. 7: 10 (1944).

APD: *Synonym of Imperata cylindrica* (L.) Raeusch.

Imperata arundinacea var. *africana* Anderss. l.c. (1856).

Saccharum thunbergii Retz., Obs. Bot. 5: 17 (1789).

Imperata thunbergii (Retz.) Nees, Fl. Afr. Austr. 89 (1841).

Imperata arundinacea var. *thunbergii* (Retz.) Hack. in Bol. Soc. Brot. 6: 142 (1888); Chev. Bot. 712.

Imperata cylindrica var. *thunbergii* (Retz.) Dur. & Schinz., Consp. Fl. Afr. 5: 693 (1895); Chev. Bot. 713.

Usually distinguished fairly readily from var. *cylindrica* by the broader, flat leaf-blades, but in the northern part of our area the two varieties tend to merge and cannot easily be separated.

Throughout tropical Africa, extending to **Egypt** and the N. African coast, and through **Arabia** to the Middle East and Afghanistan. (See Useful Plants.)

[The species is found throughout the Old World tropics. It is polymorphic, and its many forms are commonly grouped into 2 varieties. var. *spontaneum* differs in having a deltoid ligule, and the leaf-blade narrowed to the midrib at its insertion on the sheath.]

2. ***Saccharum officinarum* Linn.** Sp. Pl. 54 (1753); F.T.A. 9: 96; A. Chev. in Rev. Bot. Appliq. 13: 856; Berhaut, Fl. Sén. ed. 2, 419; Artschwager & Brandes in U.S. Dept. Agric., Handbook 122 (1958). *APD acc*

Culms up to 6 m. high.

Cultivated sugar cane. Grown, particularly as a chewing cane, on moist soils throughout our area. (See Useful Plants.)

105. ERIOCHRYISIS

P. Beauv., Ess. Agrost. 8, t. 4, f. 11 (1812); F.T.A. 9: 91 (1917).

- 1 Callus hairs 1/3 as long as the sessile spikelet, rarely up to 3/4 as long, ferruginous; sessile spikelet bisexual, awnless; pedicelled similar but female and a little smaller; lower glume coriaceous, shining ... [1. *brachypogon*](#)
Callus hairs exceeding the sessile spikelet, yellowish tawny; otherwise similar to above [2. *pallida*](#)

1. ***Eriochrysis brachypogon* (Stapf) Stapf** F.T.A. 9: 93 (1917); A. Chev. in Rev. Bot. Appliq. 13: 856; Berhaut, Fl. Sén. ed. 2, 401. *APD acc*

***Saccharum brachypogon* Stapf** in Mém. Soc. Bot. Fr. 2, 8: 97 (1908); Chev. Bot. 713.

Perennial, about 1·2 m. high: **swampy soils.**

Sen.: Niokolo-Koba Adam 17504. **Ghana:** Sampa (Dec.) Morton A2629! **N. Nig.:** Nupe Barter 1351! Gembu, Mambila (Aug.) De Leeuw 1790!

Through C. African Rep., Congo, **Uganda** and Tanzania to Rhodesia.

2. *Eriochrysis pallida* Munro in Harv., Gen. S. Afr. Pl. ed. 2: 440 (1868); F.T.A. 9: 93; A. Chev. in Rev. Bot. Appliq. 13: 856. *APD acc*

Saccharum pallidum (Munro) Benth. (1881).

S. munroanum Hack. (1889).

Perennial, about 1·2 m. high; **swampy soils**.

Guin.: Timbi (Dec.) Jac.-Fél. 7420! **N. Nig.:** Mundar, Jos (Sept.) Lawlor & Hall 638! Maisamari (Aug.) De Leeuw 1752!

Occurs in **C. African Rep., Ethiopia, Tanzania, Zambia, Rhodesia, Malawi** and **Angola**.

106. SORGHUM

Moench, Meth. 207 (1794); F.T.A. 9: 104 (1917); Snowden in J. Linn. Soc. 55: 191 (1955); nom. cons.

- 1 Nodes bearded; sessile spikelets black, densely clothed in tawny or purplish hairs [1. *purpureo-sericeum*](#)
Nodes pubescent: **2**
- 2 Perennials with well-developed creeping rhizomes; spikelets 4·5–5 mm. long, obtuse, deciduous when mature;
lower glume distinctly 3-toothed; leaf-blades 0·5–2 cm. broad [2. *halepense*](#)
Annuals or tufted perennials without rhizomes: **3**
- 3 Mature sessile spikelets persistent; grains large, often exceeding the glumes in size, usually much exposed;
cultivated [3. *bicolor*](#)
Mature sessile spikelets deciduous; grains enclosed by the glumes; wild: **4**
- 4 Sessile spikelets lanceolate; awns 5–16 mm. long; leaf-blades 0·5–2 cm. broad: **5**
Sessile spikelets narrowly ovate to ovate or elliptic: **6**
- 5 Panicle ovate-oblong to lanceolate, 20–40 cm. long and up to 15 cm. broad, the branches numerous and soon
spreading; sessile spikelets 6–8 mm. long; awn rather stout; grain 2–2·5 mm. broad [4. *lanceolatum*](#)
Panicle long and narrow, 15–60 cm. long and 1–5 cm. broad, the branches scanty and suberect; sessile spikelets
6·5–7 mm. long; awn slender; grain 1·5–2 mm. broad [5. *virgatum*](#)
- 6 Sessile spikelets 8–9 mm. long, 2·5–3·5 mm. broad; acuminate, awnless or more often with an awn 8–16 mm.
long; panicle large, loose, 15–45 cm. long, 5–25 cm. broad; leaf-blades 1–7 cm. broad [6. *vogelianum*](#)
Sessile spikelets 6–8 mm. long: **7**
- 7 Upper lemma of sessile spikelet with an awn 15–30 mm. long; sessile spikelets 2·5–3·5 mm. broad, usually
densely and persistently tomentose with mostly whitish silky hairs; panicle very narrow, 10–40 cm. long and
3–10 cm. broad, with suberect branches; leaf-blades 0·5–3 cm. broad [7. *aethiopicum*](#)
Upper lemma of sessile spikelet awnless or with an awn 5–10 mm. long; sessile spikelets 2–2·5 mm. broad;
panicle large, loose and much-branched, 20–60 cm. long and 10–25 cm. broad; leaf-blades mostly 3–6 cm.
broad [8. *arundinaceum*](#)

1. *Sorghum purpureo-sericeum* (Hochst. ex A. Rich.) Aschers. & Schweinf. Beitr. Fl. Aethiop. 302, 310 (1867); F.T.A. 9: 139. *APD acc*

Andropogon purpureo-sericeus Hochst. ex A. Rich., Tent. Fl. Abyss. 2: 469 (1851).

Annual up to 1 m. high; **clay soils**.

N. Nig.: Biu (Oct.) Oche MRK126! Tallase, Bauchi Prov. Magaji MG192!

Eastwards to Eritrea and southwards to Tanzania.

2. *Sorghum halepense* (Linn.) Pers. Syn. 1: 101 (1805); Snowden in J. Linn. Soc. 56: 191. *APD acc*

Holcus halepensis Linn., Sp. Pl. 1017 (1753).

Andropogon halepensis (Linn.) Brot. (1804).

0·3–1·5 m. high; **old farmland, roadsides and waste places**.

Sen.: Dakar (Apr.) Clayton 4005! **Dah.:** Cotonou (Mar.) Aké Assi 11137!

Mediterranean region, but now found in most of the warmer parts of the world.

3. *Sorghum bicolor* (Linn.) Moench. Méth. 207 (1794). *APD acc*

Holcus bicolor Linn., Mant. Alt. 301 (1771).

Cultivated throughout tropical Africa, with notable centres of diversification in W. Africa and the **Sudan**. Grown to a lesser extent elsewhere in the Old World tropics and subtropics, and introduced to the New World.

[Snowden (The cultivated races of Sorghum, 1936) divides the cultivated Sorghums into 31 species and numerous lesser taxa. However, there is mounting evidence that these species are almost completely interfertile, and should be regarded as the cultivars of a single species. I have adopted that position here, and those requiring a more elaborate classification are referred to Snowden's book. Curtis (in Exp. Agric. 3: 275–286 (1967)) has classified the cultivated Sorghums of Nigeria into agronomic races.

There is a small group of species (or introgression products?) which share the properties of both wild and cultivated plants; they have more or less tough racemes and tardily deciduous sessile spikelets, but occur spontaneously. The following have been introduced to, or recorded in, West Africa: *S. hewisonii* (Piper) Longley, *S. niloticum* (Stapf ex Piper) Snowden, and *S. sudanense* (Piper) Stapf. For further details see Snowden in J. Linn. Soc. Bot. 55: 191 (1955).—W.D.C.]

4. **Sorghum lanceolatum** Stapf in F.T.A. 9: 112 (1917); Snowden in J. Linn. Soc. 55: 216; A. Chev. in Rev. Bot. Appliq. 13: 857. Including *S. virgatum* of F.W.T.A. ed. 1, 2: 580, not of (Hack.) Stapf.

APD: *Sorghum arundinaceum* (Desv.) Stapf

Annual or short-lived perennial up to 2·4 m. high.

Maur.: L. Rkiz (Oct.) Adam 21824! **Sen.:** Heudelot 544! 654! **Mali:** El Oualadji (Mar.) Chev. 43947! **Ghana:** Daboya (Nov.) Thorold 264! Singa (Aug.) Rose Innes GC 31859! **Niger:** Kolo to Niamey (Dec.) P. de Fabrègues 2769! **N. Nig.:** Kwarre (Nov.) Sampson 27! Katagum Dist. Dalz. 293! **S. Nig.:** Onitsha (Mar.) Jones FHI 6277!

5. **Sorghum virgatum** (Hack.) Stapf in F.T.A. 9: 111 (1917). *APD acc*

Andropogon sorghum var. *virgatus* Hack. in DC., Monogr. Phan. 6: 504 (1889).

Annual up to 1·5 m. high.

Maur.: Matmata, Tagant (Apr.) Monod 157! **Sen.:** Niokolo-Koba (Feb.) Adam 17508! **Niger:** Illeba (Sept.) P. de Fabrègues 2528!

Extends eastwards into **Egypt** and the **Sudan**.

6. **Sorghum vogelianum** (Piper) Stapf in F.T.A. 9: 116 (1917); Snowden l.c. 219; A. Chev. in Rev. Bot. Appliq. 13: 857. *APD acc*

Andropogon sorghum subsp. *vogelianus* Piper in Proc. Biol. Soc. Wash. 28: 34 (1915).

Loosely tufted annual, or sometimes perennial, 1–5 m. high.

Mali: Gao (Aug.) de Wailly 5142! **Ghana:** Lawra (Sept.) Hall CC 770! Kpandai (July) Rose Innes GC 32576! **N. Nig.:** (Dec.) Lely 778! Makurdi (Nov.) Sampson 37! Ajaokuta (Aug.) Ward L135! Tungan Bandekwui, Jebba (June) Onochie FHI 40248! **S. Nig.:** Nun R. Vogel 11! Idu (Sept.) Holland 153! Onitsha (Nov.) Baldwin 13733! Yenagoa (Sept.) Tuley 887! **W. Cam.:** Cam. R. (Jan.) Mann 2109!

7. **Sorghum aethiopicum** (Hack.) Rupr. ex Stapf in F.T.A. 9: 119 (1917); Snowden l.c. 221; A. Chev. in Rev. Bot. Appliq. 13: 857. *APD acc*

Annual, up to 3 m. high.

Sen.: N'Tiago (Sept.) Audru 2505! **Mali:** (Jan.) Chev. 43027! Kidal (Sept.) Rossetti 59/164! **S. L.:** Njala (Aug.) Deighton 772! **Niger:** Agades (Apr.) P. de Fabrègues 1482! Zinder (Oct.) P. de Fabrègues 2267! Toukounous (May) Bartha 11! P. de Fabrègues 1558! Tanout (Apr.) P. de Fabrègues 1426! **N. Nig.:** Gajibe (Nov.) Johnston N72! Tilum, Rann Dist. (Apr.) Davey FHI 27152! Wulgo (Feb., Mar.) Davey FHI 27157! Johnston N26! Kalkala Golding 77!

Extends eastward to the **Sudan** and **Somalia**.

8. **Sorghum arundinaceum** (Desv.) Stapf in F.T.A. 9: 114 (1917); Snowden l.c. 227; A. Chev. in Rev. Bot. Appliq. 13: 857. *APD acc*

Rhaphis arundinacea Desv., Opusc. 69 (1831).

Andropogon arundinaceus Willd., Sp. Pl. 4: 906 (1805), not of Berg. (1767).

Annual or perennial 2–3·5 m. high.

Sen.: Niokolo-Koba (Oct.) Adam 15711! M'bout (Nov.) Roberty 10150! Kanéméré (July) Fotius K311! **Gam.:** Yundum, W. Div. (Dec.) Austin 18! **Guin.:** Nzérékoré (Oct.) Baldwin 9726! **S. Dalz. 8423! Accra to Dodowah (June) Rose Innes GC 30081! Kumasi (Apr.) La Danso 35! Odumase (Aug.) Howes 1203! Yapei (Aug.) Williams 844! **Dah.:** Logdo (Feb.) Raynal 13513! **N. Nig.:** Nupe Barter 1379! Katsina Ala (Aug.) De Leeuw 1713! **S. Nig.:** Lagos (May) Dalz. 1322! Oke Ado, Ibadan Dist. (Oct.) Onochie FHI 7940! Eruwa (Nov.) Onochie FHI 8143! Benin (Oct.) Maggs 21! Nun R. (Aug.) T. Vogel 50! **W. Cam.:** Victoria Maitland 977! Batibo to Mambe (June) Brunt 1172! **F. Po.:** (Dec.) Mann 114!

Extends south into the Congo.

[Preliminary investigations suggest that the wild species hybridize rather freely, both among each other and with the cultivated forms. It seems clear that the status of the present species will have to be reconsidered, but until more is known of their breeding behaviour it would be premature to attempt it.]

107. SORGHASTRUM

Nash in Britton, Man. Fl. North U.S. 71 (1901).

- 1 Awns up to 8 mm. long, rarely up to 25 mm. (specimens from Guinée); racemes bearing 1–3 spikelets, therefore at least some of the spikelets truly sessile and accompanied by only 1 pedicel [1. trichopus](#)
- Awns 30–40 mm. long; racemes each bearing only 1 spikelet, therefore every spikelet borne upon a pedicel-like branch and accompanied by 2 pedicels [2. bipennatum](#)

1. *Sorghastrum trichopus* (Stapf) Pilger in E. & P., Pflanzenfam., Aufl. 2, 14e: 142 (1940).

APD: *Synonym of Sorghastrum stipoides (Kunth) Nash*

Andropogon trichopus Stapf in Kew Bull. 1897: 287 (1897); Chev. Bot. 721.

Sorghum trichopus (Stapf) Stapf in F.T.A. 9: 141 (1917); F.W.T.A., ed. 1, 2: 582; A. Chev. in Rev. Bot. Appliq. 13: 858; Berhaut, Fl. Sén. ed. 2, 417.

Perennial, up to 1·5 m. high; spikelets light brown to straw coloured; [river flood plains](#).

Sen.: Ouassadou (Dec.) Berhaut 1688! Niokolo-Koba Adam 16880! **Cam.:** Ruxton 30! **Mali:** Diafarabé (Sept.) Lean 93! Dari (Sept.) Farrow 54a! Macina (Nov.) Duong 1300! **Guin.:** Baffing R. (Nov.) Extends southwards through Cameroun and the Congos to **Angola**, thence east to Zambia, Malawi, Mozambique and Madagascar.

108. CHRYSOPOGON

Trin., Fund. Agrost. 187 (1820); F.T.A. 9: 159 (1917); nom. cons.

- 1 Stems erect, woody at the base, fastigiately branched; awns 2 cm. long or more; panicle open, the triads borne on long flexuous peduncles [1a. aucheri var. quinqueplumis](#)
 Stems creeping, with very close nodes bearing short leafy shoots; awns up to 0.5 cm. long; panicle dense, the peduncles appressed to the axi [2. aciculatus](#)

1. *Chrysopogon aucheri* (Boiss.) Stapf in Kew Bull. 1907: 21. *APD acc*

Andropogon aucheri Boiss., Diagn. sér. 1, 5: 77 (1844).

1a. *Chrysopogon aucheri* var. *quinqueplumis* (A. Rich.) Stapf l.c.; F.T.A. 9: 160; A. Chev. in Rev. Bot. Appliq. 13: 860.

APD: *Synonym of Chrysopogon plumulosus Hochst.*

Chrysopogon quinqueplumis A. Rich., Tent. Fl. Abyss. 2: 450 (1851).

A wiry perennial of **semi-arid regions**.

Niger: Aïr (fide De Miré & Gillet in J. Agric. Trop. 3: 729).

Extends eastwards to **Uganda**, **Sudan**, **Ethiopia** and **Somalia**, thence south to Tanzania.

2. *Chrysopogon aciculatus* (Retz.) Trin. Fund. Agrost. 188 (1820); A. Chev. in Rev. Bot. Appliq. 13: 860. *APD acc*

Andropogon aciculatus Retz., Obs. Bot. 5: 22 (1789); Chev. Bot. 715.

A sward-forming perennial, **sometimes used for lawns**. The very long (3–4 mm.) needle-like callus is a menace, readily penetrating the mouths of cattle and the paws of dogs.

S. L.: New England (Oct.) Morton & Jarr SL 1441! **iv. C.:** Adiopodoumé (Apr.) Leeuwenberg 3826! Port Bouet (Mar.) Raynal 13589! **U. Volta:** Ouagadougou (Sept.) Scholz 151! **Ghana:** Legon Garden (May) Cudjoe! Tafo (Feb.) Rose Innes GC 30332! **S. Nig.:** Ibadan (May, Oct.) Townrow 20! Gledhill 628! Owo (Apr.) Haines 198! Bori to Ogoni (July) Nwanzo 729! **W. Cam.:** Victoria (July, Nov.) Maitland 16! 84! 152! Kumba (Mar., Nov.) Brenan 9459! Thorold TN100!

A species from **tropical Asia**, introduced to W. Africa and now well established in some localities.

Polytrias amaura (Büse) O. Ktze. Rev. Gen. Pl. 788 (1891). *APD acc*

Andropogon amaurus Büse in Miq., Pl. Junghn. 360 (1854).

Prostrate and mat-forming; the inflorescence a solitary raceme of numerous spikelets; spikelets all alike, in threes, 2 sessile and 1 pedicelled; **commonly used as a lawn grass**.

Commonly used as a lawn grass in the Asiatic tropics, and successfully established in the lawns of the Botanic Gardens, Victoria, **W. Cam.:** Maitland 98! 155! Keay FHI 28661!

Additional genus.

109. VETIVERIA

Lem.-Lisanc. in Bull. Soc. Philom. 1822: 43 (1822); F.T.A. 9: 156 (1917).

- 1 Sessile spikelets quite awnless, the callus glabrous; glumes spinulosely muricate [1. zizanioides](#)

Sessile spikelets awned, the callus bearded:2

- 2 Awn a short curved bristle (2)—5–(12) mm. long, enclosed or more or less exserted; callus beard up to 1 mm. long, pallid-brown [2. nigritana](#)
 Awn geniculate, up to 20 mm. long, differentiated into column and limb, the column exserted; callus beard up to 1.5 mm. long, fulvous [3. fulvibarbis](#)

1. **Vetiveria zizanioides** (Linn.) Nash in Small, Fl. Sth.-east. U.S. 67 (1903); F.T.A. 9: 157; A. Chev. in Rev. Bot. Appliq. 13: 858.

APD: *Synonym of Chrysopogon zizanioides* (L.) Roberty

Phalaris zizanioides Linn., Mant. Pl. 2: 183 (1771).

Chrysopogon zizanioides (Linn.) Roberty (1960).

Cultivated for its aromatic roots, and sometimes maintained as an ornamental.

S. L.: Freetown (Dec.) Deighton 3322! Rokupr (July) Jordan 475! **Lib.:** Monrovia (Sept.) Baldwin 9210! **Ghana:** Accra (June) Thorold CB91! Achimota (May, June) Irvine 1638! Akpabla 565!

An Asiatic species, now introduced into most tropical countries. (See Useful Plants.)

2. **Vetiveria nigritana** (Benth.) Stapf in F.T.A. 9: 157 (1917); A. Chev. in Rev. Bot. Appliq. 13: 858; Berhaut, Fl. Sén. ed. 2, 403.

APD: *Synonym of Chrysopogon nigritanus* (Benth.) Veldkamp

Andropogon nigritanus Benth. in Hook., Fl. Nigrit. 573 (1849).

A. squarrosus var. **nigritanus** (Benth.) Hack. (1889); Chev. Bot. 720.

A. zizanioides var. **nigritanus** (Benth.) A. Chev., Bot. 721 (1920).

Lenormandia insignis Steud. (1850).

Mandelorna insignis Steud. (1854).

Robust perennial 1.2–2.4 m. high, growing in clumps; [stream sides and swampy flood plains](#).

Maur.: Diouk (Nov.) Rossetti 59/231! **Sen.:** Senegal R. Adanson 159! Heudelot 294! Roger 24! Bafing plains Lecard 123! **Gam.:** Ruxton 145! **Mali:** Davey 18! Rogeon 239! Also in [W. Indies](#), and extending through India to China and Australia.

[Bothriochloa is currently the object of intensive cytological studies which suggest that all the W. African specimens should be Included in B. bladonii. This conclusion may need to be reviewed when investigations reach a more advanced state.]

112. DICHANTHIUM

Willemet in *Neue Ann. Bot.* 18: 11 (1796); *F.T.A.* 9: 177 (1917).

- 1 Inflorescence subdigitate with 3–9 racemes; sessile spikelets imbricate, oblong, 3–4 mm. long, sparsely ciliate, with a geniculate awn 16–20 mm. long; pedicelled spikelet about as long as the sessile, awnless; anthers all about 1 mm. long [annulatum](#)

Dichanthium annulatum (*Forsk.*) *Stapf* in *F.T.A.* 9: 178 (1917); *A. Chev.* in *Rev. Bot. Appliq.* 13: 861; *De Miré & Gillet* in *J. Agric. Trop.* 3: 731; *Berhaut, Fl. Sén.* ed. 2, 398. *APD acc*

Andropogon annulatus *Forsk.*, *Fl. Aegypt.-Arab.* 173 (1775).

Tufted perennial up to 1 m. high.

Sen.: Ross (Feb.) *Berhaut* 1438! **Bargny** (May) *Adam* 17672! **Mali:** Kidal (Sept.) *Rossetti* 59/153!

Fairly generally distributed in the tropics and subtropics of the Old World. (See Useful Plants.)

113. EUCLASTA

Franch. in *Bull. Soc. Hist. Nat. Autun* 8: 335 (1895); *F.T.A.* 9: 180 (1917).

- 1 Panicle umbelliform, pilose, of up to 15 nodding racemes 5–8 cm. long; axis of the panicle short, long-pilose at the nodes; lower glume of sessile spikelet 5 mm. long, strongly nerved; awns 3–4 cm. long; anthers of sessile spikelet normally 0.5 mm. long, those of pedicelled spikelet about 2 mm. long [condylotricha](#)

Euclasta condylotricha (*Hochst. ex Steud.*) *Stapf* in *F.T.A.* 9: 181 (1917); *A. Chev.* in *Rev. Bot. Appliq.* 13: 861; *Berhaut, Fl. Sén.* ed. 2, 398. *APD acc*

Andropogon condylotrichus *Hochst. ex Steud.*, *Syn. Pl. Glum.* 1: 377 (1854); *Chev. Bot.* 717.

Euclasta glumacea *Franch.* (1895).

Euclasta graminea *Th. & Hél. Dur.* (1909).

Dichanthium condylotrichum (*Hochst. ex Steud.*) *Roberty*, *Boissiera* 9: 163 (1960).

Annual; culms slender, weak, geniculately ascending, up to 1.5 m. high; nodes strongly bearded; *in partial shade*.

Sen.: Niokolo-Koba (Oct.) *Adam* 15590! *Toubacouta* (Oct.) *Monod* 8486! **Mali:** Koulikoro (Oct.) *Chev.* 2346! **Guin.:** Timbo (Oct.) *Pobéguin* 1775! **S. Tropical Africa and **tropical America**.

114. EREMOPOGON

Stapf in *F.T.A.* 9: 182 (1917).

- 1 Racemes solitary, 3–4 cm. long, on filiform peduncles exerted from a spathe-like sheath; sessile spikelets lanceolate, 4 mm. long, pale and shining with reddish tips; pedicelled spikelets lanceolate-oblong, reddish, unpitted [foveolatus](#)

Eremopogon foveolatus (*Del.*) *Stapf* in *F.T.A.* 9: 183 (1917); *A. Chev.* in *Rev. Bot. Appliq.* 13: 861.

APD: *Synonym of Dichanthium foveolatum (Delile) Roberty*

Andropogon foveolatus Del., Fl. Egypte 16 (1812); Chev. Bot. 717.

Densely tufted perennial up to 60 cm. high with wiry culms and glaucous leaf-blades.

Maur.: Oualata to Oujaf (Aug.) Rossetti 218/61! **Mali:** Bouressa to Tessalit (Sept.) Rossetti 196/59!

Extends from Mauritania to **Egypt**, **Sudan** and **Kenya**, thence through Iran and **Arabia** to India. (See Useful Plants.)

115. THEMEDA

Forsk., Fl. Aegypt.-Arab. 178 (1775); F.T.A. 9: 415 (1919).

- 1 Racemes solitary, each supported by a boat-shaped spatheole up to 5 cm. long, clustered into loose heads; the two lowest pairs of spikelets in each raceme sterile, similar, sessile, glabrous or with a few tubercle-based bristles, and forming an involucre; fertile spikelet 5–6 mm. long, chestnut brown, with a pungent rufously boarded callus; awn 4–6 cm. long [triandra](#)

Themeda triandra *Forsk.* Fl. Aegypt.-Arab. cxxiii & 178 (1775); F.T.A. 9: 416; A. Chev. in Rev. Bot. Appliq. 13: 878; Berhaut, Fl. Sén. ed. 2, 420. *APD acc*

Themeda forskalii *Hack.* (1889)—Chev. Bot. 721.

Tufted perennial 1.2–1.8 m. high with rusty brown spatheoles; **a most important grazing grass in eastern and southern Africa, where it is often a dominant constituent of grasslands.**

Sen.: Ibel Adam 18849. Kédougou (Nov.) Adam 19930! **Mali:** San (Nov.) Chev. 2362! **Guin.:** Ditinn (Dec.) Jac.-Fél. 7427! Timbo to Ditinn Chev. 18503! **U. Volta:** Ouassa to Leo (Oct.) Old World tropics generally. (See Useful Plants.)

[Rather variable, but the varieties described do not seem to show much correlation with cytological investigations.]

116. TRACHYPOGON

Nees, Agrost. Bras. 341 (1829); F.T.A. 9: 400 (1919).

- 1 Annual; sessile spikelet neuter, awnless or with an awn up to 3 cm. long, the pedicelled hermaphrodite with an awn about 6 cm. long; pedicels 1.5 mm. long, with very oblique disarticulation; callus 2 mm. long, pungent, fulvously bearded [1. chevalieri](#)
- Perennial; sessile spikelet male and awnless, the pedicelled hermaphrodite with an awn 4–7 cm. long; pedicels 3 mm. long, obliquely disarticulating; callus 2 mm. long, pungent, white-bearded [2. spicatus](#)

1. **Trachypogon chevalieri** (*Stapf*) *Jac.-Fél.* in J. Agric. Trop. 1: 60 (1954). *APD acc*

Homopogon chevalieri *Stapf* in Mém. Soc. Bot. Fr. 1, 8: 103 (1908); F.T.A. 9: 409; A. Chev. in Rev. Bot. Appliq. 13: 878.

Trachypogon ledermannii *Pilger* in Engl., Bot. Jahrb. 48: 342 (1912); F.T.A. 9: 402; F.W.T.A., ed. 1, 2: 594.

Up to 45 cm. high with flat leaf-blades and solitary racemes; **ironstone outcrops.**

N. Nig.: Naraguta (Aug.) Lely P449! Sho, Plateau Prov. (Nov.) Keay FHI 21020! Manchok, Mambila Plateau (Oct.) Magaji & Tuley 1769!

Also in **E. Cameroun**, **Congo**, **Tanzania** and **Zambia**.

2. **Trachypogon spicatus** (*Linn.*) *O. Ktze.* Rev. Gen. Pl. 794 (1891). *APD acc*

Stipa spicata *Linn. f.*, Suppl. 111 (1781).

Trachypogon plumosus (*Willd.*) *Nees* (1829)—F.T.A. 9: 403.

Andropogon plumosus *Willd.* (1806).

Wiry caespitose perennial up to 1.2 m. high; leaf-blades very narrow, usually convolute; racemes usually solitary, sometimes 2 (very rarely more in Africa).

Iv. C.: Odienné (Oct.) Aké Assi 8241! **U. Volta:** Sikasso to Boho-Dioulasso (Sept.) Adam 15127! **Ghana:** Yendi to Nakpanduri (Oct.) Rose Innes GC 30737! Gambaga to Yendi (Oct.) Rose Innes GC 30491! Walewale to Gambaga (Oct.) Rose Innes GC 30265! Gambaga (Oct.) Vigne FH 4635! Gambaga to Bawku (Oct.) Ankrah GC 20276! **Togo Rep.:** Lama Kara to Kande (Oct.) Rose Innes GC 31404! **Dah.:** Taneka to Djougou (Nov.) Risopoulos 1280! **N. Nig.:** Jos Plateau (Sept.) Lely P767! Vodni, Pankshin Div. Saunders 64! Afaka F.R., Kaduna (Nov.) Clayton 1388! Samaru, Zaria Prov. (Sept.) Freeman S115! Anara F.R., Zaria Prov. (Oct.) Keay FHI 20108!

Tropical and subtropical Africa and **tropical America**.

[Very variable in number of racemes, length of ligule and hairiness of spikelets, and some authorities divide it into several species.]

117. HETEROPOGON

Pers., *Syn. Pl.* 2: 533 (1807); *F.T.A.* 9: 410 (1919).

- 1 Lower glume of pedicelled spikelets acuminate, 15–25 mm. long, glabrous, with a line of glandular pits down the middle, keels narrowly winged; racemes with 1–3 awnless pairs at the base; awns 8–15 cm. long [*L. melanocarpus*](#)

Lower glume of pedicelled spikelets acute, 8–10 mm. long, with tubercle-based hairs near the margin, without a line of pits, keels broadly and unequally winged; racemes with 3–10 awnless pairs at the base; awns 5–10 cm. long [*2. contortus*](#)

1. **Heteropogon melanocarpus** (*Ell.*) *Benth.* in *J. Linn. Soc.* 19: 71 (1881); *F.T.A.* 9: 413; *A. Chev.* in *Rev. Bot. Appliq.* 13: 878; *Berhaut, Fl. Sén. ed. 2*, 421. *APD acc*

Andropogon melanocarpus *Ell.*, *Sketch Bot. S. Carol.* 1: 146 (1816).

Annual, up to 2 m. or more; callus pungent, 5 mm. long.

Sen.: Messira (Nov.) *Berhaut* 680! 2726! **Gam.:** Saunders 107! **Dah.:** Boguila to Echitopa (Feb.) *Chev.* 23209! **N. Nig.:** Darazo F.R., Bauchi Prov. (Oct.) *De Leeuw & Magaji* 1994!

A tropical American species, occurring sporadically in Africa and India.

2. **Heteropogon contortus** (*Linn.*) *P. Beauv. ex Roem. & Schult.* *Syst. Veg.* 2: 836 (1817); *F.T.A.* 9: 411; *A. Chev.* in *Rev. Bot. Appliq.* 13: 878; *Berhaut, Fl. Sén. ed. 2*, 421. *APD acc*

Andropogon contortus *Linn.*, *Sp. Pl.* 1045 (1753); *Chev. Bot.* 717.

Perennial, up to about 1 m. high; awns twisted into a spire when young, and forming a malignant tangled knot at maturity; callus painfully pungent.

S. L.: Mt. Aureol (Aug., Sept.) *Melville & Hooker* 324! *Hooper* 147! *Fourah Bay* (Dec.) *Cole* 17! **Iv. C.:** Tehini (Aug.) *de Wilde* 811! *Bouaké* (May) *de Wilde* 63! **U. Throughout the tropics. (See Useful Plants.)

118. THELEPOGON

Both ex Roem. & Schult., *Syst. Veg.* 2: 46 (1817); *F.T.A.* 9: 34 (1917).

- 1 Leaf-blades lanceolate, broad and subcordate at base, margins rigidly pectinate; racemes 2–17 in a bunch, up to 17 cm. long, stiff; barren pedicel linear, longer than the sessile spikelet, the latter 6–7 mm. long; lower glume prominently transversely rugose-tuberculate; lower floret male with a palea; upper lemma with a glabrous geniculate awn up to 2.5 cm. long [*elegans*](#)

Thelepogon elegans *Roth ex Roem. & Schult.* *Syst. Veg.* 2: 788 (1817); *F.T.A.* 9: 34; *A. Chev.* in *Rev.*

Bot. Appliq. 13: 849; Berhaut, Fl. Sén. ed. 2, 397. *APD acc*

Annual, up to 1 m. high, often with prop roots from the lower nodes; weed in disturbed soils.

Sen.: Népin Adam 18851. **Guin.:** Labé (Oct.) Jac.-Fél. 2016! **Ghana:** Yendi to Zabzugu (Oct.) Rose Innes GC 30704! Kete Krachi to Yendi (Nov.) Rose Innes GC 30440! Tamale (Nov.) Thorold 279! Gambaga (Nov.) Vigne FH 4679! Bawku (Oct.) Rose Innes GC 30252! **Dah.:** Boukombe (Nov.) Risopoulos 1256! **Niger:** Niamey (Oct.) Hagerup 538! Dogondouch White 36! **N. Gurum, Vogel Peak area (Nov.) Hepper 1229!

Throughout tropical Africa; also in **India** and **Malesia**. (See Useful Plants.)

119. ISCHAEMUM

Linn., Sp. Pl. 1049 (1753), and Gen. Pl. ed. 5, 469 (1764); F.T.A. 9: 28 (1917).

- 1 Sessile spikelets concave on the back, 7–8 mm. long, chartaceous; internodes and pedicels clavate to cuneate, swollen; racemes 2–3; awn 7–10 mm. long [1. afrum](#)
- Sessile spikelets flat or convex on the back, coriaceous below and becoming herbaceous towards the tip: **2**
- 2 Lower glume of sessile spikelet rugose or muricate; keels sharply involute for their whole length; racemes 2, firmly appressed together and interlocked when young: **3**
- Lower glume of sessile spikelet smooth; sharply keeled in the upper half, more broadly involute below: **4**
- 3 Lower glume deeply rugose with sharp edged ridges right across its back; sessile spikelets 4–6 mm. long; pedicelled spikelets resembling the sessile and on a pedicel about 1/3 as long as the latter, or much reduced smooth and on a pedicel as long as the sessile spikelet [2. rugosum](#)
- Lower glume with rounded knobs on the keels, not, or only obscurely, joined across the back; sessile spikelets 5.5–7 mm. long; pedicelled spikelets 6 mm. long, smooth, asymmetrically winged, borne on a short pedicel 1–2 mm. long [3. barbatum](#)
- 4 Awn 35–40 mm. long; racemes 3–4 (rarely 1–5), 12–22 cm. long, on a short common axis 1–3 cm. long, very fragile; sessile spikelets 7–10 mm. long, the keels of the lower glume winged towards the tip; spikelets, internodes and pedicels densely villous with purplish hairs [4. amethystinum](#)
- Awns 7–14 mm. long; racemes 2–3, digitate, up to 8 cm. long; internodes and pedicels shortly ciliate; sessile spikelets 5–6 mm. long: **5**
- 5 Sessile spikelets with the keels of both glumes winged, the apex of the lower glume obtuse; racemes paired ... [5. indicum](#)
- Sessile spikelets with the glumes wingless, the apex of the lower glume acute; **6**
- 6 Lower glume of sessile spikelet glabrous, ovate; culms 1 mm. diam. near base; leaf-blades narrowly lanceolate, spreading, mostly 2–10 cm. long and 4–10 mm. broad; ligule 0.5 mm. long, pilose [6. timorense](#)
- Lower glume of sessile spikelet pilose, lanceolate; culms 2–3 mm. diam. near base; leaf-blades broadly linear, erect, mostly 8–14 cm. long and 4–8 mm. broad; ligule 1–2 mm. long, glabrous [7. tallanum](#)

1. *Ischaemum afrum* (*J. F. Gmel.*) *Dandy* in F. W. Andrews, Fl. Pl. Sudan 3: 476 (1956). *APD acc*

Andropogon afer *J. V. Gmel.*, Syst. Nat. ed. 13, 2: 166 (1791).

A. brachyatherus *Hochst.* in Flora 27: 241 (1844).

A. intumescens *Pilger* in Engl., Bot. Jahrb. 45: 208 (1910).

Ischaemum brachyatherum (*Hochst.*) *Fenzl ex Hack.* in DC., Monogr. Phan. 6: 239 (1889); F.T.A. 9: 30; F.W.T.A. ed. 1, 2: 596; A. Chev. in Rev. Bot. Appliq. 13: 849.

Perennial 60–90 cm. high; black clay soils. Hairiness of spikelets varies considerably, from almost glabrous to densely villous.

N. Nig.: Kworre, Sokoto (Sept.) Palmer 17! Shigal, Rann Dist. (Feb.) Davey FHI 27169! Logomani, N. Bornu (Nov.) Johnson N83! Ngala (Mar.) Tuley 1123! Yola Div. (Sept.) Kennedy FHI 7300!

Tropical Africa and **S. Africa**.

2. *Ischaemum rugosum* *Salisb.* Ic. Stirp. Rar. 1, t. 1 (1791); A. Chev. in Rev. Bot. Appliq. 13: 849; Berhaut, Fl. Sén. ed. 2, 389, 423. *APD acc*

Straggling annual up to about 1 m. high; coastal and inland swamps.

Sen.: Kolda, Casamance (Oct.) Adam 18454! Port G.: Nova Lamego (Nov.) Esp. Santo 3158! **Guin.:** Kindia Jac.-Fél. 178! Mamou (Nov.) Chev. 34871! **S. L.:** Kambia (Dec.) Deighton 805! Rokupr (Dec.) An Asiatic species, now found in many tropical countries.

7. **Ischaemum tallanum** Rendle in J. Bot. 31: 359 (1893); F.T.A. 9: 31; Chev. Bot. 715, and in Rev. Bot. Appliq. 13: 849.

APD: Synonym of Ischaemum fasciculatum Brongn.

Argopogon villetii Mimeur in Rev. Bot. Appliq. 31: 213 (1951); Jacques-Félix in Rev. Bot. Appliq. 32: 547 (1952).

A streamside grass about 1·2 m. high, decumbent and rooting at the lower nodes.

Mali: Bamako (Dec.) Duong 20! Sikasso to Bobo-Dioulasso (Dec.) Vuillet 25956! Sikasso, ravin de Sarakoro (Nov.) Demange 2749. Sikasso, Chutes du Farako (Nov.) Demange 3133. **Guin.:** Kouria Chev. 12860 bis! Benna (Oct.) Jac.-Fél. 7177! Dalaba Adames 417! Friguiagbé (Jan.) Chillou 1142! **S. L.:** Farangbaia (Nov.) Lewis 30! Ninia, Talla (Feb.) Sc. Elliot 4927! Loma Mt. (Mar.) Morton & Gledhill SL 1026!

[The species has obvious affinities to *I. fasciculatum* Brong., *I. purpurascens* Stapf and *I. timorense* var. *villosum* C. E. C. Fisher, and a final decision as to its status must await a critical revision of this difficult group.]

120. SEHIMA

Forsk., Fl. Aegypt.-Arab. 178 (1775); F.T.A. 9: 35 (1917).

- 1 Racemes up to 8 cm. long; internodes and pedicels linear, densely ciliate on both sides; sessile spikelets linear, 1–1.4 cm. long; lower glume deeply hollowed between the dorsal keels with 3–5 prominent intercarinal nerves, terminating in an unequally 2-toothed, flat, membranous beak; upper glume with a straight awn 2 cm. long; awn of upper lemma distinctly ciliate along the spiral; pedicelled spikelet up to about 1.5 cm. long, lanceolate, conspicuously 7-nerved, long acuminate into 2 setaceous teeth [ischaemoides](#)

Sehima ischaemoides *Forsk.* Fl. Aegypt.-Arab. 178 (1775); F.T.A. 9: 37; A. Chev. in Rev. Bot. Appliq. 13: 849. *APD acc*

Annual up to 60 cm. high.

Mali: Leclercq 42658! **Niger:** Toukounous Barthé 94! **N. Nig.:** Kohukuwa (Oct.) De Leeuw 1861! Yola (Nov.) Lowe 1599a!

Tropical Africa, Arabia and India.

121. MICROSTEGIUM

Nees in Lindley, Nat. Syst. ed. 2, 447 (1836).

- 1 Leaf-blades linear-lanceolate, up to about 7 cm. long, softly pilose above and beneath; racemes 2–5, subdigitate; spikelets 4.5–6 mm. long, glabrous; lower glume with a deep median channel along the back, the nerves anastomosing near the tip; lower lemma nerveless, up to 4 mm. long, or completely absent; upper lemma 0.2 mm. long, accompanied by a tiny scale-like palea; awn very short, seldom protruding beyond the tip of the spikelet [vimineum](#)

Microstegium vimineum (*Trin.*) *A. Camus* in Ann. Soc. Linn. Lyon, n.s. 68: 201 (1921). *APD acc*

Andropogon vimineus *Trin.* in Mém. Acad. Sci. Petersb., sér. 6, 2: 268 (1832).

Microstegium aristulatum *Robyns & Tournay* in Bull. Jard. Bot. Brux. 25: 240 (1955).

Creeping annual. Asiatic specimens have glabrous or sparsely pubescent foliage, but are otherwise similar.

W. Cam.: Litoka, Cam. Mt., 4,400 ft. (Apr.) Maitland 1086!

Also in the **Congo**, and extending from India to China and Japan.

122. SCHIZACHYRIUM

Nees, Agrost. Bras. 331 (1829); F.T.A. 9: 184 (1917); Jacques-Félix in Rev. Bot. Appliq. 33: 423.

- 1 Fertile lemma bifid to beyond the middle; spikelets usually laterally compressed between internode and pedicel; lower glume of sessile spikelet chartaceous to sub-coriaceous, obscurely nerved, lanceolate to linear: **2**
 Fertile lemma shortly bifid, the lobes not extending beyond the middle (except sometimes in *S. schweinfurthii*) or entire; spikelets usually dorsally compressed; lower glume of the sessile spikelet thinly chartaceous, finely but distinctly 3–5-nerved: **15**
- 2 Leaf-blades obtuse to abruptly acute at the apex; plants rooting at the lower nodes and creeping; pedicelled spikelets smaller than the sessile: **3**
 Leaf-blades gradually tapered to a fine point, sometimes abruptly acute but then the plant erect: **8**
- 3 Column of awn scarcely exceeding the sessile spikelet; fertile lemma bifid almost to the base; racemes 1–2.5 cm. long: **4**
 Column of awn twice as long as the sessile spikelet or longer; lower glume of the sessile spikelet pubescent (sometimes sparsely so in *S. djalonicum*): **7**
- 4 Culms 3–4 mm. diam., compressed; anthers 2–3 mm. long; leaf-blades 7–17 cm. long and 4–8 mm. broad; sheaths mostly longer than the internodes, strongly compressed and keeled; spikelets 3–4.5 mm. long **1.**

platyphyllum

- Culms up to 2 mm. diam.; anthers 0.5–1 mm. long; leaf-blades 2–6 cm. long and 2–7 mm. broad; sheaths mostly shorter than the internodes; spikelets 3–3.5 mm. long: **5**
- 5** Internodes of the rhachis narrowly clavate to linear with a cupuliform tip, narrower than the spikelet; lower glume of sessile spikelet keeled in the upper half, sharply indexed below 2. *brevifolium* **6**
..... **@**
- Internodes of the rhachis broadly clavate, swollen, wider than the spikelet; lower glume of sessile spikelet keeled to the base **3. macclaudii**
- 6** Lower glume of sessile spikelet, internodes and pedicels glabrous **2a. brevifolium var. brevifolium**
Lower glume of sessile spikelet, internodes and pedicels hispid to shortly villous with white hairs **2b. brevifolium var. flaccidum**
- 7** Internodes of the rhachis linear, ciliate on both sides, narrower than the sessile spikelet; lower glume of the latter narrowly lanceolate, not pinched between internode and pedicel, 3.5 mm. long; fertile lemma bifid for 2/3 of its length; racemes 2 cm. long **4. djalonicum**
Internodes of the rhachis swollen, subcylindrical, densely pubescent, broader than the sessile spikelet; lower glume of the latter linear, pinched between internode and pedicel, 4 mm. long; fertile lemma bifid for 3/4 of its length; racemes 4 cm. long **5. radicosum**
- 8** Lower glume of sessile spikelet lanceolate, not pinched between internode and pedicel, up to 6 mm. long, glabrous; pedicelled spikelets as long as or longer than the sessile: **9**
Lower glume of sessile spikelet linear, squeezed between internode and pedicel, 5–8 mm. long; pedicelled spikelets smaller than the sessile: **11**
- 9** Internodes and pedicels clavate to cylindrical, glabrous except for a tuft of hairs on one side at the top of the pedicel; lower glume of sessile spikelet wingless; upper glume awnless; upper lemma with an awn 10–15 mm. long; spikelets 4.5–6 mm. long **6. penicillatum**
Internodes and pedicels linear or narrowly widening upwards; spikelets seldom over 4 mm. long: **10**
- 10** Upper glume of sessile spikelets shortly awned; keels of lower glume wingless, rounded in the lower half; upper lemma with an awn 11–12 mm. long; pedicelled spikelet awnless **7. lomaense**
Upper glume of sessile spikelets without an awn; keels of lower glume sharp, narrowly winged; upper lemma with an awn 2–2.5 cm. long; pedicelled spikelet with a short bristle 1–3 mm. long **8. delicatum**
- 11** Rhachis internodes cylindrical, about 2 mm. broad at the top; racemes stout, cylindrical, 5 cm. long, at length just exerted from the spatheoles; leaf-blades up to 6 cm. long and 2 mm. broad, acuminate at the apex; fertile lemma bifid for rather more than 1/2 its length; spikelets 5–7 mm. long: **12**
Rhachis internodes clavate, about 1 mm. broad at the top; racemes slender; leaf-blades up to 30 cm. long and 2–10 mm. broad: **13**
- 12** Spikelets, internodes and pedicels glabrous except for the pubescent callus concealed within the joint **9. urceolatum**
Spikelets, internodes and pedicels densely pubescent, the callus bearded and forming a conspicuous ring of hairs above each node **10. nodulosum**
- 13** Plants perennial; lower glume of sessile spikelet keeled throughout, glabrous or sometimes pubescent to villous; pedicelled spikelet awnless or with an awn seldom over 3 mm. long; racemes 5–12 cm. long .. **11. sanguineum**
Plants annual: **14**
- 14** Internodes, pedicels and lower glume of the sessile spikelet villous with hairs 2 mm. long; lower glume of sessile spikelet sharply inflexed on the sides, keeled only at the very tip; racemes 2–8 cm. long, usually sessile, rarely on peduncles up to 3 cm. long **12. exile**
Internodes and pedicels shortly ciliate on one or both sides, the lower glume of the sessile spikelet glabrous though usually with ciliate margins, or rarely pubescent; lower glume of sessile spikelet keeled throughout; racemes 4–6 cm. long on peduncles 1–3 cm. long; pedicelled spikelet with an awn 3–10 mm. long **13. rudemale**
- 15** Racemes plumose with hairs 5–6 mm. long from internodes and pedicels, gathered into a terminal bunch; internodes 6–8 mm. long, the pedicels 1–2 mm. longer; awn about 6 mm. long, without a column; fertile lemma entire; leaf-blades abruptly acute **14. pulchellum**
Racemes almost glabrous to sparsely pilose, loosely paniculate; internodes 3–5 mm. long, the pedicels subequal or shorter; awn with a distinct column: **16**
- 16** Racemes compact, cylindrical, almost glabrous (apart from the sessile spikelet callus), long exerted from the spatheole; sessile spikelets twice as long as the internodes or more; internodes and pedicels obscurely ciliate on one side; sessile spikelets glabrous; fertile lemma bilobed to near the middle; leaf-blades narrowly linear, up to 30 cm. long and 3 mm. broad, gradually attenuate at the tip **15. schweinfurthii**
Racemes flexuous, distinctly hairy; sessile spikelets up to 1 1/2 times as long as the internodes; internodes and pedicels ciliate on the lower half of one side, and the upper half of the other; sessile spikelets mostly pilose: **17**
- 17** Annual; fertile lemma entire; leaf-blades gradually acuminate **16. scintillans**

Perennials; fertile lemma bilobed: **18**

18 Leaf-blades convolute, setaceous; fertile lemma bilobed for up to 1/3 its length [17. gresicolum](#)

Leaf-blades flat, shortly acute at the tip; fertile lemma bilobed for up to 1/4 its length; column of awn 5–7 mm.
long [18. rupestre](#)

1. Schizachyrium platyphyllum (Franch.) Stapf in F.T.A. 9: 188 (1917); A. Chev. in Rev. Bot. Appliq. 13: 862; Berhaut, Fl. Sén. ed. 2, 422. *APD acc*

Andropogon brevifolius var. *platyphyllus* Franch. in Bull. Soc. Hist. Nat. Autun 8: 324 (195).

A. platyphyllus (Franch.) Pilger in E. & P., Pflanzenfam. ed. 2, 14e: 166 (1940).

Perennial, or sometimes annual, 90–120 cm. high; grows as an understorey grass among taller species; **marshy soils.**

Sen.: Badé (Dec.) Berhaut 2734! Niokolo-Koba (Oct.) Adam 15720! **Guin.:** Baffing R. (Oct.) Pobéguin 1800! Ouassou (Nov.) Jac.-Fél. 7257! **S. L.:** Mano Salija (Nov.) Deighton 343! Yeraia (Apr.) [Closely allied to *S. thollonii* (Franch.) Stapf, which has the column of the awn only 1–2.5 mm. long.]

Imperfectly known species.

Andropogon simplex Vahl & Schumach. in Schumach., Beskr. Guin. Pl. 49 (1827); F.T.A. 9: 206 (1919). *APD acc*

Apparently a species of *Schizachyrium*, but the type is lost, and the description cannot confidently be equated to any of the present species.

123. CYMBOPOGON

Spreng., Pl. Pugill. 2: 14 (1815); F.T.A. 9: 265 (1919).

Lower glume of the sessile spikelet shallowly concave, the keels sharp throughout; racemes conspicuously villous with white hairs up to 4 mm. long; leaf-blades up to 3 mm. broad, mostly arising from the caespitose base ..[4. *schoenanthus*](#)

- 1 Lower glume of sessile spikelet lanceolate, almost flat to shallowly concave on the back with a V-shaped median groove in the lower half, laterally winged at the apex; leaf-blades with a broad (up to 2.5 cm.) rounded base, gradually tapering to a filiform tip; panicle 30 cm. long or more 1. *giganteus*[2 @](#)

Lower glume of sessile spikelet narrowly lanceolate, almost flat to deeply concave with the bottom of the depression rounded, wingless at the apex; leaf-blades linear to filiform, narrowing at the base:[3](#)

- 2 Fertile lemma awned, the awn geniculate with a twisted column 3–6 mm. long and a limb 4–7 mm. long[1a. *giganteus* var. *giganteus*](#)

Fertile lemma awnless, or provided with a straight untwisted awn up to 6 mm. long .. [1b. *giganteus* var. *inermis*](#)

Leaf-blades flat and up to 3 mm. broad, but often convolute or folded in dried specimens, and up to 35 cm. long; panicle compound, the raceme-pairs aggregated into dense clusters; old basal sheaths often curly like wood-shavings[4b. *schoenanthus* subsp. *proximus*](#)

- 3 Fertile lemma awnless; lower glume deeply concave between the keels; leaf-blades up to 60 cm. long or more and 15 mm. broad[2. *citratu*](#)

Fertile lemma awned; leaf-blades up to 4 mm. broad:[4](#)

- 4 Lower glume of the sessile spikelet deeply concave between the keels, these thickened and rounded in the lower half and separated by a gibbous swelling at the base; racemes scantily hairy, the hairs up to 2 mm. long; leaf-blades cauline, 2–4 mm. broad[3. *commutatus*](#)

Leaf-blades convolute, filiform, about 1 mm. broad, up to 15 cm. long; panicle scanty, the raceme-pairs borne singly or in clusters of 2–3, rarely more; old basal sheaths never curly[4a. *schoenanthus* subsp. *schoenanthus*](#)

1. **Cymbopogon giganteus** Chiov. Gram. da Essenze 12 (1909); F.T.A. 9: 288; A. Chev. in Rev. Bot. Appliq. 13: 871; Berhaut, Fl. Sén. ed. 2, 420.

APD: Synonym of Cymbopogon caesius subsp. giganteus (Chiov.) Sales

Andropogon giganteus Hochst. in Flora 27: 242 (1844), not of Ten. (1811).

Tall perennial up to 2.5 m. high with glaucous leaves and dense narrow panicles.

- 1 Lower glume of sessile spikelet pitted on either side of a median groove; internodes of rhachis and pedicels linear:2
- Lower glume not pitted:3
- 2 Annual; inflorescence of 1–3 distant raceme-pairs partially embraced by narrow spatheoles; pits 2, circular; pedicelled spikelet with an awn 6–8 mm. long[1. pusillus](#)
- Perennial; inflorescence terminal, long exserted, of 2–3 digitate racemes; pits 3–8, irregularly oblong; pedicelled spikelets awnless[2. lacunosus](#)
- 3 Internodes of the rhachis and pedicels linear to filiform:4
- Internodes of the rhachis and pedicels distinctly swollen upwards, clavate or cuneate, rarely almost linear and then the back of the lower glume of the sessile spikelet flat with a conspicuous median groove (A. tectorum);14
- 4 Racemes terminal on the culms; lower glume of sessile spikelet flat or slightly hollowed on the back with 5–11 intercarinal nerves, one of them median (except *A. mannii*); upper glume awned:5
- Racemes gathered into spathate false panicles; lower glume of sessile spikelet concave on the back, with no intercarinal nerves; upper glume acute:9
- 5 Base of plant silky hairy; sessile spikelet 9–11 mm. long; lower glume glabrous to puberulous, winged on the keels, with 7–11 intercarinal nerves; racemes paired[3. distachyos](#)
- Base of plant glabrous:6
- 6 Spikelets pilose, 6–7 mm. long; lower glume with 5–7 intercarinal nerves; internodes and pedicels ciliate on both margins, glabrous on the face; leaf-blades up to 4 mm. broad, herbaceous; racemes paired[4. amethystinus](#)
- Spikelets glabrous:7
- 7 Racemes usually 3–8, rarely 2 or 1; sessile spikelet 7–9 mm. long, the lower glume wingless and without intercarinal nerves; leaf-blades up to 4 mm. broad, stiff but not harshly scabrid, the midrib slender ...[5. mannii](#)
- Racemes 2; lower glume of sessile spikelet with winged keels and 5–7 intercarinal nerves:8
- 8 Leaf-blades up to 2 mm. broad and 30 cm. long or more, harsh and file-like to the touch, the midrib almost 1/3 the width; sessile spikelets 6–8 mm. long; caespitose[6. lima](#)
- Leaf-blades up to 3 mm. broad and about 10 cm. long, herbaceous, with a slender midrib, scabrid only on the

- margins; sessile spikelets 7–8 mm. long; stoloniferous [7. pratensis](#)
- 9 Racemes solitary; callus of sessile spikelet 0.8 mm. long; spikelets 3–4 mm. long: 10
- Racemes paired or digitate: 11
- 10 Lemma of fertile floret entire and awnless [8. festuciformis](#)
- Lemma of fertile floret bilobed and awned from the sinus [9. incomptus](#)
- 11 Racemes 5–6; sessile spikelets about 5 mm. long, the internodes a little longer; internodes and pedicels finely filiform, arcuate, long ciliate [10. tenuiberbis](#)
- Racemes 2, rarely 3: 12
- 12 Leaf-blades involute, filiform; sheaths ciliate at the mouth; sessile spikelets 4.5–6.5 mm. long; awn 16–22 mm. long; rhachis internodes 4–5 mm. long [11. curvifolius](#)
- Leaf-blades flat, 2–4 mm. broad, abruptly acute at the tip: 13
- 13 Awns 5–9 mm. long; fertile lemma bifid for 1/3 its length; rhachis internodes 3 mm. long; racemes dense, the spikelets appressed; sessile spikelets 4.5–5 mm. long [12. incanellus](#)
- Awns 12–25 mm. long; fertile lemma bifid for up to 1/2 its length; rhachis internodes 3–4.5 mm. long; racemes loose, the spikelets divergent; sessile spikelets 4.5–6 mm. long [13. africanus](#)
- 14 Lower glume of sessile spikelets linear, laterally compressed, wedged between internode and pedicel, the back deeply depressed with the keels dorsal and almost meeting over the depression; pedicels not, or obscurely, 2-lobed: 15
- Lower glume of sessile spikelet lanceolate, not wedged between internode and pedicel, flattened on the back with a shallow median groove, the keels lateral; racemes paired, in large spathate panicles: 22
- 15 Racemes solitary, in a fastigiate panicle; upper glume of sessile spikelet with an awn about 1 cm. long; awn of fertile floret up to 5 cm. long; lower glume of pedicelled spikelet obliquely obovate-oblong, nearly 1 cm. long, many-nerved, ending in a fine bristle [14. fastigiatus](#)
- Racemes paired: 16
- 16 Upper glume of sessile spikelet and both glumes of pedicelled spikelet with fine bristle-like awns up to about 10 mm. long; inflorescence a delicate much-branched spathate panicle with conspicuous dark brown awns: 17
- Upper glume of sessile spikelet and glumes of pedicelled spikelet awnless (with awn-points up to 2 mm. long in *A. perligulatus*); raceme-pairs few on each culm, sometimes in scanty spathaceous panicles; perennials: 18
- 17 Annual; awn of fertile floret 35–40 mm. long; leaf-sheaths and blades glabrous [15. pseudapricus](#)
- Perennial; awn of fertile floret 20–35 mm. long; leaf-sheaths and blades glabrous or pubescent [16. ascinodis](#)
- 18 Racemes markedly dorsiventral, the pedicelled spikelets lying flat upon the back, imbricate, and concealing the internodes and pedicels; no auricles; internodes and pedicels ciliate on both sides, not inflated: 19
- Racemes not dorsiventral, the pedicelled spikelets more or less lateral and not covering the internodes and pedicels: 21
- 19 Back of lower glume of sessile spikelet convexly rounded and 5–6-nerved on either side of the median depression, becoming keeled only in the upper half; internodes and pedicels stout, cylindric; palea absent [17. ivorensis](#)
- Back of lower glume of sessile spikelet sharply 2-keeled throughout, the keels dorsal and contiguous; internodes and pedicels clavate; upper floret with a palea: 20
- 20 Leaf-blades linear, up to 45 cm. long and 14 mm. broad, mostly cauline; racemes 6–12 cm. long; sessile spikelets 5–7 mm. long [18. schirensis](#)
- Leaf-blades lanceolate-linear, 5–15 cm. long and up to 5 mm. broad, clustered towards the base; racemes 3–7 cm. long; sessile spikelets 5 mm. long [19. dummeri](#)
- 21 Sheath-auricles and ligules 5–12 mm. long, usually glabrous at the throat; pedicels clavate, about as wide as the gap between internode and pedicel; upper glume usually aristulate [20. perligulatus](#)
- Sheath-auricles and ligules up to 2 mm. long, usually setose at the throat; pedicels inflated, about twice as wide as the gap between internode and pedicel; upper glume acute [21. canaliculatus](#)
- 22 Rhachis internodes and pedicels almost linear, slightly widening at the truncate tips, 3 mm. long, ciliate on both sides; leaf-blades thin, lanceolate, light green; panicle large, decompound; racemes 3–4 cm. long; sessile spikelet 4–5 mm. long with an awn 15–20 mm. long [22. tectorum](#)
- Rhachis internodes and pedicels clavate, conspicuously widening above, the pedicel more or less bilobed at the tip; leaf-blades firm; racemes 4–6 cm. long: 23
- 23 Leaf-blades very large, 20–40 mm. broad and up to 75 cm. long; pedicels broadly clavate, 4 mm. long, scantily ciliate on both sides and often puberulous on the face; lower glume of sessile spikelet 5–6 mm. long; awn of fertile floret 9–16 mm. long; pedicelled spikelet 4–5 mm. long, its awn up to about 1 mm. long; external ligule absent [23. macrophyllus](#)
- Leaf-blades usually less than 16 mm. broad, rarely up to 25 mm.: 24

- 24 Mouth of leaf-sheath produced into acute linear-lanceolate auricles 5–30 mm. long; lower glume of sessile spikelet with a line of hairs in the median groove; leaf-blades up to 10 mm. broad, but usually less: 25
Mouth of leaf-sheath forming rounded shoulders, or rarely produced into ovate auricles up to 3 mm. long: ... 26
- 25 Perennial, the basal sheaths compressed and keeled; internodes and pedicels glabrous or sparsely hairy on the face; sessile spikelet 5·5–7 mm. long, the awn 10–17 mm. long; upper glume glabrous to puberulous 24. [auriculatus](#)
Annual; internodes and pedicels pubescent to tomentose on the face; sessile spikelet 5·5–10 mm. long, the awn 18–25 mm. long; upper glume pubescent to tomentose 25. [chevalieri](#)
- 26 Sessile spikelet 9–11 mm. long, the keels of both glumes bearing a cartilaginous wing; pedicelled spikelet 8–10 mm. long, pilose; pedicels ciliate on both sides 26. [pteropholis](#)
Sessile spikelet up to 8 mm. long, the glumes inconspicuously winged: 27
- 27 Pedicels swollen, almost ovoid, about 4 mm. long and 1·8 mm. broad, ciliate both sides; sessile spikelet 5–6 mm. long, with an awn 15–22 mm. long; pedicelled spikelet glabrous or puberulous; annual 27. [pinguipes](#)
Pedicels clavate, up to 6 times as long as wide, their sides straight or only slightly convex; perennials: 28
- 28 Pedicels 3 mm. long, scantily ciliate on one or both sides, and often puberulous on the face; pedicelled spikelet 4–4·5 mm. long, awnless or with a mucro up to 1 mm. long; sessile spikelet 4–5 mm. long, usually with a line of hairs along the median groove; awn 9–12 mm. long; external ligule absent 28. [gabonensis](#)
Pedicels 4–5 mm. long, conspicuously ciliate, glabrous on the face; pedicelled spikelet 5–7 mm. long; sessile spikelet 5–8 mm. long, glabrous; external ligule often present as a membranous rim at the junction of sheath and blade on the abaxial side 29. [gayanus](#) 29
..... @
- 29 Internodes and pedicels ciliate on one side: 30
Internodes and pedicels ciliate on both sides; sessile spikelet 5–6 mm. long; awn of sessile spikelet 15–30 mm. long and of pedicelled 3–7 mm.: 31
- 30 Pedicelled spikelet glabrous; sessile spikelet 6 mm. long; awn of sessile spikelet 10–20 mm. long, and of pedicelled spikelet 1–2 mm. 29a. [gayanus](#) var. [gayanus](#)
Pedicelled spikelet villous or pubescent; sessile spikelet 6–8 mm. long; awn of sessile spikelet 15–30 mm. long, and of pedicelled spikelet 5–10 mm. 29b. [gayanus](#) var. [tridentatus](#)
- 31 Pedicelled spikelet glabrous 29c. [gayanus](#) var. [squamulatus](#)
Pedicelled spikelet villous 29d. [gayanus](#) var. [bisquamulatus](#)

1. **Andropogon pusillus** *Hook. f.* in J. Linn. Soc. 7: 233 (1864); Clayton in Kew Bull. 19: 455. *APD acc*

Hyparrhenia pusilla (*Hook. f.*) *Stapf* in F.T.A. 9: 379 (1919); F.W.T.A., ed. 1, 2: 591.

Annual up to 15 cm. high.

N. Nig.: Chappal Waddi, Mambila Plateau (Nov.) Jackson, Magaji & Tuley 2054! **W. Cam.:** Cam. Mt., 7,000 ft. (Dec.) Mann 2097!

2. **Andropogon lacunosus** *J.G. Anderson* in Bothalia 8: 113 (1962). *APD acc*

Perennial up to 60 cm. high; **wet places.**

W. Cam.: Mbiambi, 6,000 ft. (June) Brunt 746!

Also in **Transvaal.**

3. **Andropogon distachyos** *Linn.* Sp. Pl. 1046 (1753); F.T.A. 9: 218. *APD acc*

Perennial, 30–75 cm high.

W. Cam.: Mann 1345! Mann's Spring, Cam. Mt., 7,500 ft. (Feb., Dec.) Boughey GC 10621! Mann 2078! Steele 101! Mauve, 8,000 ft. (Feb.) Maitland 1035!

Europe, N. Africa, Levant and **Arabia**, highlands of tropical Africa and in S. Africa.

4. **Andropogon amethystinus** *Steud.* Syn. Pl. Glum. 1: 371 (1854); F.T.A. 9: 216, partly. *APD acc*

Andropogon abyssinicus of F.W.T.A., ed. 1, 2: 586, not of R. Br.

Perennial, tufted or with short underground rhizomes, about 30 cm. high.

W. Cam.: Cam. Mt., 7,800–9,000 ft. (Nov.–Jan.) Migeod 170! Hinds C43! Maitland! Keay FHI 28587! Bafut-Ngemba F.R., 6,990 ft. (Feb.) Hepper 2123! **F. Po:** S. Isabel Peak (Mar.) Guinea 2778!

Also in **Ethiopia**, **Kenya** and **Uganda**.

5. **Andropogon mannii** *Hook. f.* in J. Linn. Soc. 7: 232 (1864); F.T.A. 9: 226. *APD acc*

Densely tufted perennial 30–45 cm. high.

S. L.: Mt. Loma (Feb. –Apr.) Jaeger 9781! 9418! 9487! **iv. C.:** Mt. Momi (Oct.) Aké Assi 9165! **W. Cam.:** Cam. Mt., 9,500–12,000 ft. (Dec., Jan.) Mildbr. 10892! Maitland 1271! Hinds C35! C39! Keay FHI 28826! **F. Po:** Clarence Peak, 9,000 ft. (Dec.) Mann 654!

6. **Andropogon lima** (*Hack.*) *Stapf* in F.T.A. 9: 217 (1919). *APD acc*

Andropogon amethystinus var. **lima** *Hack.* in DC., Monogr. Phan. 6: 464 (1889).

Andropogon amethystinus var. **breviaristatus** *Hack.* l.c.

Andropogon amethystinus of F.T.A. 9: 216, partly.

Densely tufted perennial up to 1 m. high.

W. Cam.: Cam. Mt., 8,500 ft. (Dec.) Mildbr. 10856! Mauve, 8,000 ft. (Feb.) Maitland 1041! Ukele Camp, 8,000 ft. (Feb.) Maitland 1340! Johann-Albrechtshutte, 9,350 ft. (Jan., Dec.) Breteler et al. MC10! Mann 2084!

Also in the **Sudan**, **Ethiopia**, the **African highlands**, and **Malawi**.

7. **Andropogon pratensis** *Hochst. ex Hack.* in DC., Monogr. Phan. 6: 463 (1889); F.T.A. 9: 219.

APD: *Synonym of Andropogon amethystinus Steud.*

Stoloniferous perennial up to about 45 cm. high.

N. Nig.: Vom (Oct.) Gambles 26a!

Also in **Ethiopia**, **Kenya**, **Tanzania** and **Zambia**.

8. **Andropogon festuciformis** *Rendle* in Cat. Welw. 2: 145 (1899); Clayton in Kew Bull. 17: 469 (1964).

APD acc

Andropogon schlechteri *Hack.* in Bull. Herb. Boiss., ser. 2, 6: 703 (1906).

Hypogynium schlechteri (*Hack.*) *Pilger* (1940).

H. spathiflorum of F.T.A. 9: 168, not of Nees.

Caespitose perennial 1 m. high; **flood plains and damp grasslands**.

Mali: Sikasso, Chutes du Farako (Oct.) Demange 3039. **Guin.:** Fouta Djallon (Dec.) Jac.-Fél. 7430!

Also in the **Congo**, **Zambia**, **Angola** and **S. Africa**.

9. **Andropogon incomptus** *W. D. Clayton* in Kew Bull. 17: 467 (1964). *APD acc*

Caespitose perennial up to 2.5 m. high.

Guin.: Madina Tossekré (Oct.) Adam 12528!

10. **Andropogon tenuiberbis** *Hack.* in DC., Monogr. Phan. 6: 435 (1889); F.T.A. 9: 232. *APD acc*

Andropogon calvescens *Stapf* in F.T.A. 9: 232 (1919); F.W.T.A., ed. 1, 2: 586; A. Chev. in Rev. Bot. Appliq. 13: 863; Berhaut, Fl. Sén. ed. 2, 420.

Leptopogon tenuiberbis (*Hack.*) *Roberty* in Boissiera 9: 203 (1960).

Coarse tufted perennial up to 6 m. high, with sharply keeled and interleaved sheaths; **waterlogged soils**.

Sen.: Kaême (Oct.) Kerharo & Adam 1509. **Guin.:** Baffing R. (Oct.) Pobéguin 1802! **S. L.:** Gberia Timbako (Oct.) Small 465! Dankawali (Nov.) Glanville 323! **Lib.:** Siaple, Sanokwele Dist. Also in **C. African Rep.** and the **Sudan**.

Imperfectly known species.

Andropogon gambiensis A. Chev. in Rev. Bot. Appliq. 13: 870 (1933).

An inadequately described species from Senegal, of which the type is missing.

Andropogon guineensis Schumach. Beskr. Guin. Pl. 51 (1827).

Cymbachne guineensis (Schumach.) Roberty in Boissiera 9: 244 (1960).

The description suggests *A. gayanus*, but it is not conclusive and I have been unable to trace any authentic specimens.

Andropogon leucostachyus Kunth in Humb. & Bonpl., Nov. Gen. & Sp. 1: 187 (1816); F.W.T.A., ed. 1, 2: 586; A. Chev. in Rev. Bot. Appliq. 13: 866.

A tropical American species recorded from Senegal; probably introduced.

Andropogon sp. **A.** *APD acc*

N. Nig.: mile 69 Yola to Biu (Nov.) Magaji & Tuley 1842!

Apparently an annual form of *A. gayanus* var. *squamulatus*.

Stapf in Hook., Ic. Pl. t. 3093 (1922); Clayton in Kew Bull. 20: 73 (1966).

- 1 Leaf-blades not cordate at the base; pedicelled spikelets 16–25 mm. long, laterally winged towards the tip; sessile spikelets 7–8 mm. long, excluding the pungent callus which is 4–5 mm. long; awn 9–15 cm. long, pubescent; homogamous pairs 3–9 at the base of each raceme [1. grandiflorus](#)
- Leaf-blades cordate and semi-amplexicaul at the base; pedicelled spikelets 9–13 mm. long, wingless; sessile spikelets 6–7 mm. long, with an acute to pungent callus 1–2 mm. long; awn 4–8 cm. long; homogamous pairs 1 at the base of the lower raceme: **2**
- 2 Annual; awn hirtellous to hoary hirsute [2. hagerupii](#)
- Perennial; awn shortly pubescent to hirtellous [3a. amplexens var. catangensis](#)

1. *Diheteropogon grandiflorus* (Hack.) Stapf in Hook., Ic. Pl. t. 3093 (1922). *APD acc*

Andropogon grandiflorus Hack. in Flora 68 127 (1885).

Heteropogon grandiflorus (Hack.) Roberty in Boissiera 9: 137 (1960).

Perennial 1–2 m. high **poor sandy soils in drainage hollows or near streams.**

N. Nig.: Nupe Barter 1373! Chappal Waddi, Mambila (Nov.) Jackson, Magaji & Tuley 2079! **S. Nig.:** Udi, Onitsha Prov. (Sept., Oct.) Jones 6782! Onochie FBI 34114! Enugu (Sept.) Tuley 883!

Extends into the Congo, Tanzania, Zambia, Rhodesia, Malawi and **Angola.**

2. *Diheteropogon hagerupii* Hitchc. in Proc. Biol. Soc. Wash. 43: 89 (1930); A. Chev. in Rev. Bot. Appliq. 13: 870 Lebrun in Bull. Soc. Bot. Fr. 116: 259. *APD acc*

Heteropogon hagerupii (Hitchc.) Roberty in Boissiera 9: 137 (1960).

Annual, 1–1.5 m. high; **dry sandy or gravelly soils.**

Extends from the Congo, **Kenya** and Tanzania southwards to the Cape. (See Useful Plants.)

Fourn., Mex. Pl. 2: 51 (1886); F.T.A. 9: 291 (1919); Clayton in Kew Bull., Add. Ser. No. 2 (1969).

- 1 Callus of sessile spikelet broadly rounded, semicircular; spikelets glabrous; raceme-bases unequal, the upper more or less flattened, glabrous, 1.5–3 mm. long [1. *glabriuscula*](#)
- Callus of sessile spikelet acute to pungent, rarely obtuse but then the other characters not as above: **2**
- 2 Upper raceme-base terete or filiform, usually much longer than the lower, glabrous or sometimes softly hirtellous, without an appendage; spatheoles narrow: **3**
- Upper raceme-base flattened, scarcely longer than the lower: **18**
- 3 Spikelets wholly or partly rufously hairy: **4**
- Spikelets white-hairy or glabrous: **9**
- 4 Basal leaf-sheaths densely pubescent to tomentose below: **5**
- Basal leaf-sheaths glabrous: **7**
- 5 Sheath hairs white; callus of sessile spikelets 0.8–1.2 mm. long, acute [2. *nyassae*](#)
- Sheath hairs dark purplish red; callus of sessile spikelets 0.5–0.8 mm. long, obtuse to narrowly truncate at the tip
3. *smithiana* **6**
- [@](#)
- 6 Culms 40–100 cm. high; spikelet indumentum very dense, dark rufous to chocolate coloured [3a. *smithiana* var. *smithiana*](#)
- Culms 150–250 cm. high; spikelet indumentum rufous or fulvous [3b. *smithiana* var. *major*](#)
- 7 Fertile spikelets, or some of them, awnless, 12–19 per raceme-pair [4. *exarmata*](#)
- Fertile spikelets awned: **8**
- 8 Sessile spikelets 3–5 mm. long; upper raceme-base 2–3.5 mm. long, with or without 1 homogamous pair; callus obtuse, 0.2–0.8 mm. long; racemes with (7–)9–14 awns per pair; pedicelled spikelets awnless, rarely mucronate [5. *rufa*](#)
- Sessile spikelets 5.5–7 mm. long; upper raceme-base 3.5–7 mm. long, with 1–2 homogamous pairs; callus acute to pungent, 1–2 mm. long; racemes 4–7-awned per pair; pedicelled spikelet often with an awn-point up to 2 mm. long [6. *poecilotricha*](#)
- 9 Upper raceme with or without 1 homogamous pair at the base: **10**
- Upper raceme with 2 homogamous pairs: **15**
- 10 Plants perennial: **11**
- Plants annual: **13**
- 11 Spikelets glabrous to hispidulous; racemes 2–6-awned per pair; callus linear, 1–2 mm. long; upper raceme-base 1.5–2.5 mm. long, hirtellous; pedicelled spikelets with an awn up to 5 mm. long [7. *finitima*](#)
- Spikelets pubescent to villous: **12**
- 12 Racemes not deflexed [8. *hirta*](#)
- Racemes, or some of them, deflexed at maturity [9. *quarrei*](#)
- 13 Racemes 6–9-awned per pair; column of awn bearing hairs up to 1.5 mm. long; upper raceme-base 2–3 mm. long: **14**
- Racemes 2-awned per pair; awn hirsute with hairs 3–5 mm. long; upper raceme-base 4–7 mm. long .. [12. *barteri*](#)
- 14 Awn 2.5–4 cm. long, pubescent with hairs 0.1–0.5 mm. long; callus 0.8–1.2 mm. long, acute [10. *violascens*](#)
- Awn 5–8 cm. long, hirtellous with hairs 1–1.5 mm. long; callus 1.5–2.5 mm. long, pungent [11. *bagirmica*](#)
- 15 Peduncle with spreading yellow hairs towards the tip; racemes deflexed; awns 3–5 per raceme-pair; pedicelled spikelet with an awn 2–10 mm. long [13. *familiaris*](#)
- Peduncle with or without white hairs towards the tip; racemes not deflexed; pedicelled spikelet with an awnlet up to 5 mm. long; awn hirtellous with hairs 0.7–1.2 mm. long; upper raceme-base typically 4.5–8 mm. long; callus 1.8–3 mm. long: **16**
- 16 Annual; awn 5–7.5 cm. long [14. *figariana*](#)
- Perennial; awn 3–5.5 cm. long [15. *filipendula*](#)
- 17 Spikelets glabrous; racemes 2-awned per pair [15a. var. *filipendula*](#)
- Spikelets white villous; racemes 2–4-awned per pair [15b. var. *pilosa*](#)
- 18 Raceme-bases bearded; 1 pair of homogamous spikelets at base of lower raceme only: **19**
- Raceme-bases glabrous; 2 pairs of homogamous spikelets at the base of both racemes: **27**

- 19 Raceme-bases unappendaged, though sometimes with a scarious rim: 20
 Raceme-bases produced at the insertion of the lowest fertile spikelet into a scarious appendage 0.5–4 mm. long; racemes 2–4-awned per pair: 24
- 20 Pedicelled spikelets glabrous: 21
 Pedicelled spikelets villous; awns 4–7 per raceme-pair: 22
- 21 Spatheoles 0.8–1.8 cm. long, enclosing the racemes; awns 3–5 per raceme-pair, up to 1.6 cm. long; callus almost square, broadly obtuse [16. cymbaria](#)
 Spatheoles 3.5–5 cm. long, the racemes exserted; awns 6–11 per raceme-pair, 2.8–3.4 cm. long; callus oblong to cuneate, subobtuse [17. cyanescens](#)
- 22 Awn 0.7–1.3 cm. long; callus rounded; spatheole 1.2–2.3 cm. long; peduncle 3–13 mm. long; pedicelled spikelet muticous or with an awn-point up to 1 mm. long; culms robust and supported by stilt roots [18. umbrosa](#)
 Awn over 1.5 cm. long; callus cuneate; spatheole 2–4 cm. long; peduncle 10–25 mm. long: 23
- 23 Culms robust, supported by stilt roots; awn 2.2–4 cm. long; pedicelled spikelets usually with a bristle 2–6 mm. long [19. rudis](#)
 Culms slender, without stilt roots, arising in clumps from a short underground rhizome; awn 1.5–2.5 cm. long; pedicelled spikelets with a short awn-point 1–3 mm. long [20. collina](#)
- 24 Annuals; panicle loose and leafy; awn 4–6.5 cm. long; pedicelled spikelet with a bristle 2–10 mm. long: 25
 Perennials: 26
- 25 Awns 2 per raceme-pair; appendage narrowly oblong, 3.5–4 mm. long; sessile spikelet 7.5–10 mm. long [21. niariensis](#)
 Awns 3 per raceme-pair; appendage oblong, 0.5–2 mm. long; sessile spikelet 5–7 mm. long [22. welwitschii](#)
- 26 Pedicel tip with a short obtusely triangular lobe; sessile spikelet 4–6 mm. long, the awn 1–2.5 cm. long; pedicelled spikelet muticous or with a mucro up to 1 mm. long; panicle narrow, dense [23. bracteata](#)
 Pedicel tip drawn out into a subulate tooth 0.2–1.5 mm. long; sessile spikelet 6–10 mm. long, the awn 2.2–5.5 cm. long; pedicelled spikelet with a bristle 1–5 mm. long; panicle loose, often scanty [24. newtonii](#)
- 27 Sessile spikelets awnless [25. mutica](#)
 Sessile spikelets awned: 28
- 28 Perennials: 29
 Annual; awn 7–11 cm. long 30
- 29 Column of awn pubescent with hairs 0.2–0.4(–0.5) mm. long, the awn 2–5.5 cm. long; peduncles 3–15 mm. long; spatheoles 2–4.5 cm. long [26. diplandra](#)
 Column of awn hirtellous with hairs 0.5–1.7 mm. long, the awn 4.5–7.5 cm. long; peduncles 10–35 mm. long; spatheoles 3–7 cm. long [27. subplumosa](#)
- 30 Pedicelled spikelet with an awn 8–20 mm. long; awns 4 per raceme-pair; base of spatheole and supporting ray glabrous, or sometimes bearded at the node [28a. involocrata var. involocrata](#)
 Pedicelled spikelet with an awn 1–5 mm. long; awns 2(–4) per raceme-pair; base of spatheole and supporting ray pilose [28b. involocrata var. breviseta](#)

1. **Hyparrhenia glabriuscula** (*Hochst. ex A. Rich.*) *Anderss. ex Stapf* in F.T.A. 9: 372 (1919); Clayton in Kew Bull., Add. Ser. 2: 47 (1969). *APD acc*

Andropogon glabriusculus *Hochst. ex A. Rich.*, Tent. Fl. Abyss. 2: 468 (1851).

Hyparrhenia amoena *Jac.-Fél.* in J. Agric. Trop. 1: 46 (1954); Berhaut, Fl. Sén. ed. 2, 426.

Tufted perennial 1.2–1.8 m. high, closely resembling *Cymbopogon*; **seasonally swampy soils and river flood plains.**

Sen.: Niokolo-Koba (Sept., Oct.) Adam 15715! 15811! 17147! Kidira (Nov.) Berhaut 1896! **U. Volta:** Prost! Go (Oct.) Scholz 169! 170! Nanguédi (Nov.) Scholz 187! **Ghana:** Han to Tumu (Oct.) 4. *Hyparrhenia exarmata* (Stapf) Stapf in F.T.A. 9: 308 (1919); A. Chev. in Rev. Bot. Appliq. 13: 872; Clayton l.c. 60. *APD acc*

Cymbopogon exarmatus Stapf in Journ. de Bot. sér. 2, 2: 210 (1909).

Andropogon rufus var. *exarmatus* (Stapf) Stapf ex A. Chev., Sudania 1: 180 (1911).

Perennial, or perhaps sometimes annual, 1.5 m. high; in savanna, often bordering swampy soils.

U. Volta: Bobo-Dioulasso (Oct.) Kmoch 120!

Also in **C. African Rep.**, the **Congo** and **Sudan**.

Care should be taken not to confuse this species with specimens of *H. rufa* in which the awn has been destroyed by the attack of a smut fungus.

5. *Hyparrhenia rufa* (Nees) Stapf in F.T.A. 9: 304 (1919); A. Chev. in Rev. Bot. Appliq. 13: 872; Berhaut, Fl. Sén. ed. 2, 426; Clayton l.c. 60. *APD acc*

Trachypogon rufus Nees, Agrost. Bras. 345 (1829).

Perennial or sometimes annual, 0.3–2.4 m. high; typically a tall savanna grass, often preferring moister sites, but dwarfed forms may be found by roadsides and other frequented places.

Throughout tropical Africa, and also in tropical America. Introduced into most other tropical countries. (See Useful Plants.)

6. *Hyparrhenia poecilotricha* (Hack.) Stapf in F.T.A. 9: 309 (1919); Clayton l.c. 69. *APD acc*

Andropogon poecilotrichus Hack. in Bol. Soc. Brot. 3: 138 (1885).

Perennial, 0.6–1.5 m. high; in savanna

Guin.: Timbo (Dec.) Adam 2673! Nzérékoré to Beyla (May) Adam 5050! Labe (Nov.) Adames 410! **Ghana:** Gambaga (Oct.) Rose Innes GC 30764! Kintampo (Dec.) Vigne FH 3201! **N. Nig.:** Njawai (Nov.) Jackson, Magaji & Tuley 1923! **W. Cam.:** Bambui (June) Brunt 1185!

Throughout tropical Africa.

Perhaps the result of hybridization between *H. rufa* and *H. filipendula*.

7. *Hyparrhenia finitima* (Hochst.) Anderss. ex Stapf in F.T.A. 9: 299 (1919); Clayton l.c. 72. *APD acc*

Andropogon finitimus Hochst. in sched., Schimp. Iter. Abyss. 1797 (1844).

Cymbopogon finitimus (Hochst.) T. Thoms. in Speke, Journ. Discov. Source Nile 652 (1863).

Tufted perennial, 1–2 m. high; inflorescence dense, often fastigiate; a ruderal species of roadsides, waste land and farm fallows.

S. L.: Mateboi (Nov.) Jordan 843!

Rather widely distributed, but mainly in south tropical Africa and **Uganda**.

8. *Hyparrhenia hirta* (Linn.) Stapf in F.T.A. 9: 315 (1919); A. Chev. in Rev. Bot. Appliq. 13: 874; De Miré & Gillet in J. Agric. Trop. 8: 733; Clayton l.c. 75. *APD acc*

Andropogon hirtus Linn., Sp. Pl. 1046 (1753).

Perennial 30–60 cm. high with a dense basal tussock of narrowly linear or filiform leaves; dry soils in open places.

Niger: Aïr (fide de Miré & Gillet).

Shores of the Mediterranean, extending through the Middle East to Pakistan, and southwards through **Egypt** and **Arabia** to northern Tanzania; also in **South Africa**. Probably introduced in Australia and Central America.

9. *Hyparrhenia quarrei* Robyns Fl. Agrost. Congo Belge 1: 171 (1929); Clayton l.c. 82. *APD acc*

Tufted, with culms 1–2 m. high and leaf-blades up to 5 mm. broad; roadsides, clearings and disturbed sites.

N. Nig.: Maska (Nov.) Thatcher S510! Abuja (Dec.) Thatcher S585! Bokkos (Nov.) Magaji & Tuley 1816! Mayo Daga (Nov.) Magaji & Tuley 1879!

Throughout tropical Africa.

Perhaps the result of hybridization between *H. hirta* and *H. nyassae*.

10. *Hyparrhenia violascens* (Stapf) W. D. Clayton in Kew Bull., Add. Ser. 2: 88 (1969). *APD acc*

Hyparrhenia soluta var. *violascens* Stapf in F.T.A. 9: 319 (1919); F.W.T.A., ed. 1, 2: 591.

Annual about 1 m. high; [roadsides and old cultivation](#).

N. Nig.: Bimasa Bakuro-Tureta F.R. (Nov.) Latilo FHI 43780! Katagum Dalz. 263! Fika (Oct.) Daggash FHI 24880! Shendam (Nov.) Clayton 1469! Abinsi (Nov.) Dalz. 891! Gurum, Vogel Peak (Nov.) Hepper 1282!

Also in **E. Cameroun** and **Chad**. (See Useful Plants.)

11. **Hyparrhenia bagirmica** (*Stapf*) *Stapf* in F.T.A. 9: 319 (1919); A. Chev. in Rev. Bot. Appliq. 13: 874; Berhaut, Fl. Sén. ed. 2, 424; Clayton l.c. 89. *APD acc*

Cymbopogon bagirmicus *Stapf* in Journ. de Bot. sér. 2, 2: 214 (1909).

C. solutus *Stapf* l.c. 211 (1909).

Andropogon bagirmicus (*Stapf*) A. Chev., Sudania 1: 166 (1911).

A. brachypodus *Stapf ex A. Chev.*, Sudania 1: 167 (1911), without descr.

Hyparrhenia soluta (*Stapf*) *Stapf* in F.T.A. 9: 318 (1919).

Annual up to nearly 2 m. high; [roadsides and old cultivation](#).

Sen.: Niokolo-Koba (Oct.) Adam 15886! Tambacounda (Oct.) Adam 12720! Samba to Torodo (Oct.) Adam 18456! **N. Nig.:** Moshi, Katsina (Oct.) Clayton 1379! Samaru, Zaria (Oct., Nov.) Thatcher S497! S499! Darazo F.R., Bauchi Prov. (Oct.) De Leeuw & Magaji 1993! Damagum (Oct.) De Leeuw 1254!

Also in **Chad** and the **C. African Republic**.

12. **Hyparrhenia barteri** (*Hack.*) *Stapf* in F.T.A. 9: 321 (1919); A. Chev. in Rev. Bot. Appliq. 13: 874; Clayton l.c. 90. *APD acc*

Andropogon barteri *Hack.* in Flora 68: 124 (1885); Chev. Bot. 716.

Annual up to nearly 2 m. high; inflorescence narrow, dense, of up to 8 fastigiate tiers; [old farmland and roadsides](#).

Throughout tropical Africa and in **India**. (See Useful Plants.)

133. URELYTRUM

Hack. in E. & P., Pflanzenfam. 2, 2: 25 (1889); F.T.A. 9: 42 (1917).

- 1 Racemes numerous, usually 30 or more, in whorls along the axis of a panicle 30–60 cm. long; leaf-blades up to about 20 mm. broad; sessile spikelet 5–6 mm. long, its lower glume subacute and smooth between the spinously ciliate keels; callus rounded, obtuse; awn 7–15 mm. long, rarely wanting *l. giganteum*

- Racemes 1–9, subdigitate; leaf-blades up to 6 mm. broad:2
- 2 Lower glume of sessile spikelets conspicuously muricate on the keels:3
- Lower glume of sessile spikelets smooth on the keels or spinulose-ciliolate near the tip:4
- 3 Annual; racemes solitary; sessile spikelets 5–7 mm. long, glabrous; pedicelled spikelets 3–7 mm. long or almost suppressed; awns 2.5–3.5 cm. long, spirally coiled about the raceme below, the upper part horizontally spreading [2. *anuum*](#)
- Perennial; racemes 2–4; sessile spikelets 6–8 mm. long, usually shortly pubescent on the back; pedicelled spikelets more or less reduced; awns 5–7 cm. long, falcate [3. *muricatum*](#)
- 4 Ligule 4–16 mm. long, adnate to auricles from the top of the sheath:5
- Ligule 1–2 mm. long; pedicelled spikelets more or less reduced; awns falcate:6
- 5 Sessile spikelets 8–11 mm. long; pedicelled spikelets suppressed, the awn 6.5–10 cm. long, falcate; racemes 1–3; ligule 7–16 mm. long [4. *auriculatum*](#)
- Sessile spikelets 6 mm. long; pedicelled spikelets 5 mm. long, the awn 4.5 cm. long and spirally coiled about the raceme with the upper part spreading horizontally; racemes 1; ligule 4–5 mm. long [5. *semispirale*](#)
- 6 Racemes 4–9; sessile spikelet 6–7 mm. long, glabrous; awns 2.5–4 cm. long [6. *fasciculatum*](#)
- Racemes solitary:7
- 7 Awn up to 5 cm. long; sessile spikelets 6–8 mm. long, pubescent [7. *gracilius*](#)
- Awn 1–2 cm. long; sessile spikelets 8–10 mm. long, glabrous [8. *pallidum*](#)

1. **Urelytrum giganteum** *Pilger* in Engl., Bot. Jahrb. 34: 125 (1904); F.T.A. 9: 46. *APD acc*

Urelytrum thyrsoides *Stapf* in F.T.A. 9: 47 (1917); F.W.T.A., ed. 1, 2: 599; A. Chev. in Rev. Bot. Appliq. 13: 850.
Rhytachne gigantea *Stapf* (1908).

Robust perennial up to 2.5 m. high; **swampy places**.

N. Nig.: Ward 703! Abinsi (Aug.) Dalz. 902! Fadan Karshi, Wamba (Oct.) Kennedy FHI 8041! Yankari (Sept.) Oche & Tuley 1657! **S. Nig.:** Ogoja (Aug.) Nwanzo 770! **W. Cam.:** Boku, Donga plain Brunt 999!

Extends south to the Congo and east to the **Sudan**. (See Useful Plants.)

2. **Urelytrum annuum** *Stapf* in Mém. Soc. Bot. Fr. 2, 8: 99 (1908); F.T.A. 9: 44; Chev. Bot. 714; Berhaut, Fl. Sén. ed. 2, 389. *APD acc*

Erect annual about 1.2 m. high; **shallow or rocky soils**.

4. **Urelytrum auriculatum** *C. E. Hubbard* in Kew Bull. 4: 368 (1949). *APD acc*

Perennial, 90–120 cm. high.

N. Nig.: Vodni, Pankshin Saunders 36a!

5. **Urelytrum semispirale** *W. D. Clayton* in Kew Bull. 20: 257 (1966).

APD: *Synonym of Urelytrum agropyroides (Hack.) Hack.*

Ghana: Ahamansu (Sept.) Rose Innes GC 31325!

6. *Urelytrum fasciculatum* Stapf ex C. E. Hubbard in Kew Bull. 4: 370 (1949).

APD: Synonym of Urelytrum digitatum K. Schum.

Caespitose perennial up to nearly 2 m. high.

N. Nig.: Gembu to Donga R., Mambila (Aug.) De Leeuw 1804! **W. Cam.:** Jakiri (June) Brunt 689!

Also in **E. Cameroun** and **C. African Rep.**

7. *Urelytrum gracilius* C. E. Hubbard in Kew Bull. 4: 369 (1949).

APD: Synonym of Urelytrum agropyroides (Hack.) Hack.

Perennial about 1 m. high.

N. Nig.: Shika, Zaria Bumpus 29!

8. *Urelytrum pallidum* C. E. Hubbard in Kew Bull. 4: 376 (1949).

APD: Synonym of Urelytrum agropyroides (Hack.) Hack.

Perennial up to 2·5 m. high.

Ghana: Yendi (Aug.) Hinds 6! Yendi to Gambaga (Sept.) Ankrah GC 20255! Kpandai to Salaga (Oct.) Ankrah GC 20404!

134. JARDINEA

Steud., Syn. Pl. Glum. 1: 360 (1854); F.T.A. 9: 50 (1917).

- 1 Racemes numerous, up to 25 cm. long, fasciculate from a short common axis; sessile spikelets 4–7 mm. long, acuminate to apiculate, muricate on sides and back or the smaller spikelets on the sides only; callus truncate; pedicelled spikelets similar, with or without an awn-point up to 2 mm. long [congoensis](#)

Jardinea congoensis (Hack.) Franch. in Bull. Soc. Hist. Nat. Autun 8: 321 (1895); F.T.A. 9: 53; A. Chev. in Rev. Bot. Appliq. 13: 850. *APD acc*

Rhytachne congoensis Hack. in DC., Monogr. Phan. 6: 277 (1889).

Perennial, 1·6–3·6 m. high; best distinguished from awnless forms of *Urelytrum giganteum* by the truncate, square-cornered callus of the sessile spikelets; **swampy places**.

Ghana: Avedo, Sogakope, Adidome junction (Sept.) Rose Innes GC 31280! Kete Krachi to Yendi (Oct.) Rose Innes GC 30950! Navrongo to Lawra (Oct.) Rose Innes GC 30290! Tumu (Oct.) Rose Innes GC 32292! **Togo Rep.:** Lomé Warnecke 235! Kande to Lama Kara (Oct.) Rose Innes GC 31402! **N. Nig.:** Ilorin (Aug.) Ward L104! Badeggi (Sept.) Clayton 300! Nupe Barter 1381! Zaria (Aug.) Extends east to the **Sudan**, and south through the Congo to **Angola** and Zambia. (See Useful Plants.)

135. LASIURUS

Boiss., Diagn. Pl. Nov. Or. sér. 2, 4: 145 (1859); F.T.A. 9: 60 (1917).

- 1 Perennial, almost subwoody at the base, with wiry glaucous culms; blades linear, long-attenuate to a setaceous tip, glaucous, glabrous except for a few hairs near the ligule; racemes up to 10 cm. long, densely white villous, the spikelets often three at each node, two sessile and one pedicelled; sessile spikelets 6–9 mm. long, pale green, the lower glume flat, hirsute, emarginate or 2-toothed at the tip [hirsutus](#)

Lasiurus hirsutus (Forsk.) Boiss. Diagn. Pl. Nov. Or. sér. 2, 4: 146 (1859); F.T.A. 9: 60; A. Chev. in

Rev. Bot. Appliq. 13: 851; De Miré & Gillet in J. Agric. Trop. 3: 733.

APD: Synonym of Lasiurus scindicus Henrard

Saccharum hirsutum Forsk., Fl. Aegypt.-Arab. 16 (1775).

Up to 90 cm. high; **dry soils**.

Mali: Bouresaa to Tessalit (Sept.) Rossetti 194/1959! **Niger:** Agades (Feb.) Bradley 3! Aïr (fide De Miré & Gillett).

Also in N. Africa and eastwards through Iraq, **Egypt**, **Sudan**, **Somalia** and **Arabia** to India.

136. ELIONURUS

Kunth ex Willd., Sp. Pl. 4: 941 (1806); F.T.A. 9: 62 (1917).

- 1 Lower glume of the sessile spikelet with tooth-like warts bearing tufts of hair on the margin:2
- Lower glume of the sessile spikelet merely ciliate:4
- 2 Perennial; leaf-sheaths villous to tomentose; blades stiff, glabrescent to villous above, closely ribbed and scaberulous on the veins below; racemes long-exserted [1. hirtifolius](#)
- Annuals:3
- 3 Racemes distant, long-exserted; leaf-sheaths glabrous to pilose; blades thin, usually rolled, glabrescent or with a few sparse hairs [2. elegans](#)
- Racemes gathered in bundles, embraced below by the spatheoles [3. royleanus](#)
- 4 Lower glume of both spikelets with awns up to 20 mm. long [4. euchaetus](#)
- Lower glume of sessile spikelet with awns up to 4 mm. long, the pedicelled spikelet at most apiculate:5
- 5 Culms much branched, the flowering branches 2–3-nate, forming a spathate false panicle; leaf-blades 2–5 mm. broad, often involute:6
- Culms simple, with a terminal raceme and sometimes 1–2 axillary racemes; leaf-blades filiform, or (in our area) up to 3 mm. broad [7. argenteus](#)
- 6 Callus of sessile spikelet 2 mm. long, the lower glume glabrous on the back; hairs fringing glume short, stiff, up to 0.5 mm. long 5. platypus..... [5. platypus](#)
- Callus of sessile spikelet 1 mm. long, the lower glume glabrescent to villous; hairs fringing glume usually longer, up to 1 mm. long [6. pobeguinii](#)

1. *Elionurus hirtifolius* Hack. in DC., Monogr. Phan. 6: 341 (1889); F.T.A. 9: 63; A. Chev. in Rev. Bot. Appliq. 13: 851. *APD acc*

Tufted perennial, 30–60 cm. high.

Ghana: Burufo (Dec.) Adams 4423! Zuarungu (Dec.) Adams & Akpabla 4306! Lawra (May) Morton GC 7617! **N. Nig.:** Zongon Daji, Kabba Prov. (Nov.) Clayton 597! Abinsi (Mar.) Dalz. 878! Nupe Barter 1176! Throughout tropical and S. Africa.

[Specimens from W. Africa, Congo, Uganda and Ethiopia differ from typical *E. argenteus* in their harder basal sheaths and broader leaf-blades; but the two forms intergrade and cannot be reliably separated.

The generic name was spelled *Elyonurus* by Willd., but eventually published by Kunth (1816) as *Elionurus*; the etymology leaves no doubt that Willd. miscopied it. Several of the species are closely allied to, perhaps conspecific with, American species, but the taxonomy of the latter is not clear and it would be premature to attempt a correlation.]

137. LOXODERA

Launert in Bol. Soc. Brot. 37: 80 (1963), and in Senck. Biol. 46: 121 (1965).

- 1 Pedicelled spikelets awnless *1. ledermannii*
 Pedicelled spikelets with awns 5–15 mm. long *2. strigosa*

1. *Loxodera ledermannii* (Pilger) W. D. Clayton ex Launert in Senck. Biol. 46: 121 (1965); Clayton in Kew Bull. 20: 258 (1966). *APD acc*

Elionurus ledermannii Pilger in Engl., Bot. Jahrb. 45: 207 (1910).

Lasiurus maitlandii Stapf & C. E. Hubbard in Kew Bull. 1927: 264.

Densely caespitose perennial about 60 cm. high.

Niger: Gaya (Oct.) Boudet 5259! **N. Nig.:** 17 miles N. of Kaduna (May) Keay FHI 25759! Shaganu (June) J. Hall 1283!

Also in **E. Cameroun** and **Uganda**.

2. *Loxodera strigosa* (Gledhill) W. D. Clayton in Kew Bull. 23: 295 (1969). *APD acc*

Urelytrum strigosum Gledhill in Bol. Soc. Brot. sér. 2, 41: 58 (1967).

Tufted, perennial up to 1 m. high, the basal sheaths becoming fibrous at maturity.

S.L.: Loma Mts. (Feb.) Gledhill 369!

138. HACKELOCHLOA

O. Ktze., Rev. Gen. 2: 776 (1891).

- 1 Leaf-blades linear-lanceolate, rounded and amplexicaul at the base, coarsely setose with tubercle-based hairs, up to 10 cm. long and about 1 cm. broad; racemes solitary, 1–2 cm. long, supported by spatheoles; sessile spikelet 1.5 mm. long, the lower glume pitted and tubercled; pedicelled spikelet ovate, 1.5 mm. long, herbaceous; pedicel fused to the adjacent internode *granularis*

Hackelochloa granularis (Linn.) O. Ktze. Rev. Gen. Pl. 2: 776 (1891); Berhaut, Fl. Sén. ed. 2, 421. *APD acc*

Cenchrus granularis Linn., Mant. 2, App. 575 (1771).

Manisuris granularis (Linn.) Linn. f., Nov. Gram. Gen. 40 (1779); F.T.A. 9: 57; Chev. Bot 715, and in Rev. Appliq. 13: 850.

M. polystachya P. Beauv. (1804).

Rottboellia granularis (Linn.) Roberty (1960).

Annual, up to 60 cm. high or more; **weed of cultivated land**.

Gam.: Saunders 35! **Mali:** Nyamino to Koulikoro (Oct.) Chev. 2280! Labézenga (Sept.) Hagerup 438! Dioura (Sept.) Davey 074! **Guin.:** Chillou 976! Kindia Jac.-Fél. 176! Timbo (Oct.) Pobéguin 1770! Cam.:** Gurum, Vogel Peak (Nov.) Hepper 1314! Gangumi, Gashaka (Dec.) Latilo & Daramola FHI 28798!

Throughout the tropics. (See Useful Plants.)

139. OXYRHACHIS

Pilger in Not. Bot. Gart. Berl. 11: 655 (1932).

- 1 Spikes solitary on the end of the culms, erect, up to 16 cm. long, the spikelets sunk in hollows; internodes of the rhachis 5–10 mm. long, disarticulating very obliquely along a line some 3 mm. long; spikelets lanceolate, 4–6 mm. long, subacute, furnished with 2 glumes and 2 lemmas, the lower barren, the upper bisexual and sometimes accompanied by a tiny palea [gracillima](#)

Oxyrhachis gracillima (Baker) C. E. Hubbard in Hook., Ic. Pl. t. 3454 (1947), incl. subsp. *occidentalis* Gledhill in Bol. Soc. Brot. 41: 61 (1967). *APD acc*

Rottboellia gracillima Baker in J. Linn. Soc. Bot. 22: 553 (1887).

Oxyrhachis mildbraediana Pilger in Not. Bot. Gart. Berl. 11: 655 (1932).

Caespitose perennial with filiform leaves; **marshy soils**.

S. L.: Loma Mts. (Jan.) Jaeger 9409! 9485! **N. Nig.:** Maisamari, Mambila (Aug.) De Leeuw 1746! **W. Cam.:** Jakiri, Bamenda Div. (Feb.) Hepper 2069!

Also in **Tanzania**, **Zambia** and **Madagascar**.

140. HEMARTHRIA

R. Br., Prodr. Fl. Nov. Holl. 207 (1810); F.T.A. 9: 54 (1917).

- 1 Racemes solitary to fasciculate, 5–7 cm. long; sessile spikelet linear-oblong to oblong, 5–7 mm. long, glabrous; lower glume laterally 2-keeled, obtuse at the tip; pedicelled spikelet similar, but with the lower glume acute [altissima](#)

Hemarthria altissima (Poir.) Stapf & C. E. Hubbard in Kew Bull. 1934: 109; Berhaut, Fl. Sén. ed. 2, 421. *APD acc*

Rottboellia altissima Poir., Voy. Barb. 2: 105 (1789).

R. fasciculata Lam., Tab. Encycl. Méth. Bot. 1: 204 (1791).

Hemarthria fasciculata (Lam.) Kunth, Rev. Gram. 1: 153 (1829); F.T.A. 9: 55; A. Chev. in Rev. Bot. Appliq. 13: 850.

Manisuris altissima (Poir.) Hitchc. (1934).

Perennial up to 1.6 m. high; the culms ascending from a decumbent rooting base; **wet places**.

Sen.: fide Raynal in Adansonia 7: 331 (1967). **Mali:** N. of Mopti (July) Lean 48! **N. Nig.:** Ward 54! Argungu (July) Latilo FHI 62756! Kworre (Sept.) Palmer 32! Daura (Aug.) J. Hall 467!

Chad, **Tanzania**, **south tropical** and **S. Africa**, extending east through Madagascar and Mauritius to India and Burma; also on the shores of the Mediterranean and, probably introduced, in tropical America.

141. ROTTBOELLIA

Linn. f., Nov. Gram. Gen. 23 (1779); F.T.A. 9: 72 (1917); nom. cons.

- 1 Racemes cylindric, 8–15 cm. long, borne in a leafy panicle, the uppermost spikelets barren and forming a slender tail-like appendage; internodes of the rhachis 4–6 mm. long; sessile spikelets a little shorter than the internodes; lower glume coriaceous, ovate, subacute; upper glume boat-shaped, sharply keeled, laterally compressed; pedicelled spikelet as long as the sessile, but green, striate, chartaceous and dorsally compressed [exaltata](#)

Rottboellia exaltata Linn. f. Nov. Gram. Gen. 40, t. 1 (1779); F.T.A. 9: 73; Chev. Bot. 713 and in Rev. Bot. Appliq. 13: 852; Berhaut, Fl. Sén. ed. 2, 392.

APD: *Synonym of Rottboellia cochinchinensis* (Lour.) Clayton

A tall annual up to 3·5 m. high, often supported by stilt roots, with leaf-blades up to 2·5 cm. broad; lower sheaths painfully hispid with stiff hairs; **fallow land, particularly where fertility is high.**

Gam.: McCarthy Is. (Sept.) Pirie 49/33! Wallikunda (Sept.) Macluskie 18! **Guin.:** Dyeke (Oct.) Baldwin 9675! Kindia Jac.-Fél. 212! Timbo (Oct.) Pobéguin 1804! Kouroussa (Nov.) Pobéguin 532! **S. Throughout the Old World tropics, and in the **West Indies**. (See Useful Plants.)

142. ROBYNSIOCHLOA

Jac.-Fél. in J. Agric. Trop. 7: 406 (1960).

- 1 Racemes 4–10 cm. long, borne in a scanty leafy panicle; internodes of the rachis 3–4 mm. long; sessile spikelets about as long as the internodes; lower glume coriaceous, oblong, laterally 2-keeled, the apex truncate, emarginate and winged; upper glume boat-shaped, with a winged keel; pedicelled spikelet 5–7 mm. long, ovate, acute, green, chartaceous, striate *purpurascens*

Robynsiochloa purpurascens (Robyns) Jac.-Fél. in J. Agric. Trop. 7: 406 (1960).

APD: *Synonym of Chasmopodium purpurascens (Robyns) Clayton*

Rottboellia purpurascens Robyns, Fl. Agrost. Congo Belge 1: 66 (1929); F.W.T.A., ed. 1, 2: 602; *Jac.-Fél.* in Rev. Bot. Appliq. 32: 548; Ballard in Hook., Ic. Pl. t. 3139.

Robust swamp grass up to 1·6 m. high, rooting at the lower nodes.

Guin.: Baffing R. (Oct.) Pobéguin 1806! **S. L.:** Bandakor (Sept.) Fisher 1768! Rokon, Samu (Oct.) Jordan 570! Subu, Nongoba Bullom (Oct.) Jordan 598! Bumbe (Apr.) Glanville 234! Kambia (Sept.) Jordan 307!

Also in the **Congo**.

143. CHASMOPODIUM

Stapf in F.T.A. 9: 76 (1917).

- 1 Culms 2–4 m. high; leaf-blades 1–4·5 cm. broad, smooth or scaberulous, often with a false petiole at the base; racemes fragile, 5–13 cm. long, the glumes of the terminal spikelet foliaceous and produced into a tail up to 2·5 cm. long; joints and pedicels glabrous or ciliate; lower glume of the sessile spikelet rigidly coriaceous, ovate to oblong, smooth, laterally winged towards the tip and bifid or emarginate at the apex, 20–35-nerved; pedicelled spikelet almost as long as the sessile, its lower glume variously winged at the tip, usually on one side only *caudatum*

Chasmopodium caudatum (Hack.) Stapf in F.T.A. 9: 76 (1917); A. Chev. in Rev. Bot. Appliq. 13: 854; Berhaut, Fl. Sén. ed. 2, 392. *APD acc*

Rottboellia caudata Hack. in DC., Monogr. Phan. 6: 298 (1889).

R. afzelii Hack. l.c. 300.

R. kerstingii Pilger in Engl., Bot. Jahrb. 34: 126 (1904).

Chasmopodium afzelii (Hack.) Stapf in F.T.A. 9: 77 (1917).

Annual **savanna** grass, with a considerable range of variation in both spikelet and vegetative characters.

Guin.: Kindia Jac.-Fél. 180! Timbo (Mar.) Pobéguin 1805! Macenta (Oct.) Baldwin 9839! **S. L.:** (Dec.) Sc. Elliot 3938! Bumbuna (Oct.) Thomas 3346! Makump (Oct.) Glanville 59! Rokupr (Nov.) Throughout tropical Africa. (See Useful Plants.)

145. RHYTACHNE

Desv. in Hamilt., Prodr. Fl. Ind. Occ. 11 (1825); F.T.A. 9: 81 (1917); Clayton in Kew Bull. 20: 258 (1966), and in Kew Bull. 24: 309 (1970).

- 1 Plants perennial:2
Plants annual:6
- 2 Pedicelled spikelets similar to the sessile:3
Pedicelled spikelets suppressed or up to 1 mm. long; basal sheaths not fibrous; spikelets glabrous:4
- 3 Spikelets and internodes glabrous; basal sheaths fibrous; lower glume longitudinally striate, and sometimes also transversely rugose; spikelets at most mucronate [1. glabra](#)
Spikelets and internodes densely pubescent; basal sheaths not fibrous; lower glume smooth; spikelets with an awn 2–2·5 cm. long from their upper glumes [2. perfecta](#)
- 4 Lower glume smooth; rhachis internodes 6–8 mm. long; leaf-blades flat or convolute, up to 4 mm. broad; spikelets awnless; upper glume concealed [3. megastachya](#)
Lower glume transversely rugose, at least on the keels:5
- 5 Leaf-blades filiform; rhachis internodes 3–5 mm. long; glumes of sessile spikelet and rudimentary pedicelled spikelet with or without awns up to 5 mm. long; upper glume smooth, concealed [4. rotthoellioides](#)
Leaf-blades flat, basal sheaths compressed and keeled; internodes of rhachis 6–7 mm. long; glumes awnless; upper glume rugose on the keel, visible between the slightly parted pedicel and internode [5. furtiva](#)
- 6 Rhachis internodes 4–6 mm. long, the pedicel 1–2 mm. longer; lower glume with deep transverse corrugations; glumes of sessile and rudimentary pedicelled spikelets with awns usually 5–7 mm. long [6. triaristata](#)
Rhachis internodes 2–3 mm. long, the pedicel as long; lower glume inconspicuously rugose; glumes of sessile and rudimentary pedicelled spikelets with awns usually 3–5 mm. long [7. gracilis](#)

1. **Rhytachne glabra** (*Gledhill*) *W. D. Clayton* in Kew Bull. 23: 295 (1969). *APD acc*

Lepargochloa glabra *Gledhill* in Bol. Soc. Brot. 40: 65 (1966).

Densely tufted perennial 30–45 cm. high; mountain [grassland](#).

Guin.: Mt. Nimba Schnell 969. **S. L.:** Tingi Mts. (Apr., Dec.) Morton & Gledhill SL 1885! SL 3083! Loma Mts. (Jan.–Apr.) Morton & Gledhill SL 1096! Jaeger 8845! 9779!

2. *Rhytachne perfecta* Jac.-Fél. in J. Agric. Trop. 1: 41 (1954). *APD acc*

Caespitose plant about 60 cm. high.

Guin.: Massif du Benna Brun 7!

3. *Rhytachne megastachya* Jac.-Fél. in Rev. Bot. Appliq. 32: 552 (1952). *APD acc*

Robust perennial about 1 m. high; [wet land subject to flooding](#).

146. ZEA

Linn., Sp. Pl. 971 (1753), and Gen. Pl. ed. 5, 419 (1754); F.T.A. 9: 26 (1917).

- 1** Leaf-blades linear-lanceolate, up to about 1 m. long and 10 cm. broad or more; male spikelets paired, one sessile or subsessile, the other stalked, in large terminal panicles (the “tassel”); female spikelets in axillary sheathed “ears”, the spikelets paired, both sessile, in longitudinal rows on a thick spongy axis (the “cob”); styles very long, exserted from the ear in a silky tassel (the “silk”) [mays](#)

Zea mays **Linn.** Sp. Pl. 971 (1753); F.T.A. 9: 26; Chev. Bot. 712, and in Rev. Bot. Appliq. 13: 848; De Miré & Gillet in J. Agric. Trop. 3: 740. **APD acc**

The common maize, cultivated throughout the area. Originally from the New World, now introduced to all tropical and warm temperate regions. (See Useful Plants.)

147. COIX

Linn., Sp. Pl. 972 (1753), and Gen. Pl. ed. 5, 419 (1754); F.T.A. 9: 27 (1917).

- 1** Annual up to about 2 m. high; leaf-blades lanceolate, rounded or subcordate at the base, up to 45 cm. long and 5 cm. broad; male spikelets paired or in threes, one pedicelled, the other(s) sessile, in a raceme 2.5–5 cm. long, subtended by a hard, polished, white or bluish sheath 8–10 mm. long; female inflorescence reduced to a solitary spikelet enclosed within the sheath and forming with it a false fruit [lacryma-jobi](#)

Coix lacryma-jobi **Linn.** Sp. Pl. 972 (1753); F.T.A. 9: 27; Mimeur in Rev. Bot. Appliq. 31: 198; Vallayes in Bull. Agric. Congo Belge 39: 247; Chev. Bot. 712, and in Rev. Bot. Appliq. 13: 848; Berhaut, Fl. Sén. ed. 2, 420. **APD acc**

“Job’s Tears”; **stream banks and moist places**.

A native of tropical Asia, and probably introduced into Africa. (See Useful Plants.)

The false fruit can vary much in shape and size, but so far only the typical form (var. *lacryma-jobi*) has been found in W. Africa

KEY TO THE PRINCIPAL GROUPS OF PLANTS AS ARRANGED IN THIS FLORA

KEY TO THE PRINCIPAL GROUPS OF PLANTS AS ARRANGED IN THIS FLORA

- 1 Plants without flowers or seeds; producing spores which develop into prothalli bearing the reproductive organs, antheridia (male) and archegonia (female):
Plants with flowers and seeds; pollen-grains (containing within their walls the microgametophytes which do not produce antheridia) represent the male gametophytes; the embryo-sac represents the megaspore, which develops into a minute parasitic prothallus within the ovule (equivalent to the megasporangium) and after fertilization develops into a seed (SPERMATOPHYTA):2
- 2 Ovules not enclosed in an ovary; plants dioecious or monoecious; apparent flowers usually arranged (in one or both sexes) in cones of slender spikes; no-perianth; pollen-sacs ("anther-cells") ovoid, closely set on the lower face of the cone-scales, or (when flowers spicate) borne on free or fused filaments (Gnetum); female cone-scales imbricate, stipitate and peltate, or fertile scales solitary or paired, bearing a pair of sessile inverted ovules on the lower side; seeds drupe-like, with a fleshy outer coat or sometimes an aril; endosperm copious with a slender embryo; cotyledons 2:.....3
Ovules enclosed in a closed ovary; flowers not or very rarely arranged in cones; stamens usually differentiated into filament and anther; seeds with or without endosperm; cotyledons 2 or 1 (ANGIOSPERMAE):5
- 3 Leaves parallel-veined, alternate; male flowers in cones; shrubs or trees (GYMNOSPERMAE):.....4
Leaves net-veined, simple, opposite; male and female flowers in spikes; sperm cells eciliate, not motile; slender climber (CHLAMYDOSPERMAE, GNETALES)3. [Gnetaceae](#)
- 4 Leaves pinnatisect, in a terminal tuft crowning the thick simple stem, circinate in bud; sperm cells ciliate, motile; female flowers in large cones (CYCADALES)1. [Cycadaceae](#)
Leaves simple, alternate; sperm cells eciliate, not motile; female fertile cone-scale solitary or paired (CONIFERALES)2. [Podocarpaceae](#)
- 5 Leaves usually net-veined, alternate or opposite; floral parts mostly in fours or fives, or in multiples of these numbers, very rarely in threes or sixes (Annonaceae and Menispermaceae); cotyledons 2, rarely more; herbs, shrubs or trees; stem in cross-section showing the vascular bundles arranged in a ring or rings: [DICOTYLEDONES](#)
Leaves usually parallel-veined, mostly alternate; floral parts usually in threes or sixes; cotyledon 1; mostly herbs, rarely trees; stem in cross-section showing the vascular bundles scattered and not arranged in regular rings:[MONOCOTYLEDONES](#)

KEY TO THE FAMILIES OF MONOCOTYLEDONS

KEY TO THE FAMILIES OF MONOCOTYLEDONS

- 1 Gynoecium composed of 2 or more free or almost free carpels with separate styles and stigmas: [Group 1](#)
 Gynoecium composed of 1 carpel or of 2 or more united carpels with free or united styles and stigmas: [2](#)
- 2 Ovary superior; perianth present or absent: [3](#)
 Ovary inferior or Semi-inferior; perianth present: [6](#)
- 3 Perianth present, composed of 4 or more free or united segments, not reduced to bristles: [4](#)
 Perianth absent or reduced to bristles or to 1-3 free or united scales: [5](#)
- 4 Perianth composed of separate calyx and corolla, the calyx often herbaceous, the corolla petaloid or otherwise different from the calyx, the sepals and petals either free or united among themselves but not all united into a single perianth-tube [Group 2](#)
 Perianth composed of similar or subsimilar segments in 2 series, petaloid or sometimes herbaceous or dry and glumaceous, either free or all united into a single perianth-tube [Group 3](#)
- 5 Flowers solitary or few together or arranged in heads or spikes, not enclosed by scale-like bracts; ovary 1- or more-locular with 1 or more ovules [Group 4](#)
 Flowers (florets) arranged in small spikes (spikelets) and enclosed by scale-like bracts (glumes or lemmas), the spikelets sometimes 1-flowered; ovary 1-locular with 1 ovule; grasses and sedges [Group 5](#)
- 6 Androecium composed of 2 or more fertile stamens [Group 6](#)
 Androecium composed of 1 fertile stamen sometimes accompanied by 1 or more petaloid staminodes .. [Group 7](#)

Group 1

- 1 Saprophytic herbs; leaves reduced to scales [166. Triuridaceae](#)
 Plants not saprophytic; leaves well developed, not reduced to scales: [2](#)
- 2 Leaves pinnate; palms [193. Palmae](#)
 Leaves simple; aquatic or marsh herbs: [3](#)
- 3 Perianth absent; stamens 2, free or united; submerged aquatic plants with narrow linear leaves: [4](#)
 Perianth present, composed of 2-6 free segments; stamens 3 or more: [5](#)
- 4 Flowers bisexual, in 2-flowered spikes; anthers free; carpels 4 or more, with sessile peltate stigmas; plants of saline water [169. Ruppiaceae](#)
 Flowers dioecious, solitary, axillary; anthers united; carpels 2, with 2 filiform stigmas; plants marine [170. Zannichelliaceae](#)
- 5 Flowers with bracts, whorled in simple or compound inflorescences, the inflorescence sometimes spike-like or forming an umbel of 1 or more flowers; perianth composed of 3 sepals and 1-3 petals, or sometimes without petals: [6](#)
 Flowers without bracts, spicate; perianth composed of 2-4 similar segments; plants aquatic: [7](#)
- 6 Carpels slightly united at the base, in 1 whorl, with numerous ovules scattered over the wall of the ovary; marsh plants; inflorescence an umbel, sometimes with an additional whorl of flowers below [163. Butomaceae](#)
 Carpels free, in 1 whorl or spirally arranged, with 1 basal ovule; aquatic or marsh plants [165. Alismataceae](#)
- 7 Leaves radical; spikes simple or 2-branched on elongated peduncles, at first enclosed in a spathe; perianth-segments 2-3; anthers borne on elongated filaments; ovules 2 or more in each carpel ... [167. Aponogetonaceae](#)
 Leaves borne on elongated stems; spikes simple on axillary peduncles, without a spathe; perianth-segments 4; anthers sessile; ovule 1 in each carpel [168. Potamogetonaceae](#)

Group 2

- 1 Leaves pinnate or flabellate or bifurcate; palms, sometimes climbing [193. Palmae](#)
 Leaves simple, not flabellate or bifurcate; herbs: [2](#)
- 2 Ovary 1-locular with 3 parietal placentas bearing numerous ovules; petals united below into a tube; stamens 3, inserted at the mouth of the corolla-tube and alternating with staminodes; leaves all or mostly radical; flowers in bracteate spikes or heads on elongated peduncles [174. Xyridaceae](#)
 Ovary 2-3-locular with axile or apical placentas bearing 1 or more ovules; petals free or united; stamens 6 or fewer, sometimes accompanied by staminodes: [3](#)
- 3 Style 2-6-branched; flowers monoecious, small, in bracteate heads on elongated peduncles; corolla inconspicuous, not brightly coloured, often minute in the male flowers; leaves narrow, radical or crowded [176. Eriocaulaceae](#)
 Style simple, unbranched; flowers bisexual or polygamous; corolla conspicuous, often blue or yellow: [4](#)

KEY TO THE FAMILIES OF MONOCOTYLEDONS

- 4 Anthers opening by a terminal pore; flowers actinomorphic, in shortly pedunculate bracteate heads; petals united, below into a slender tube; stamens 6, all fertile; ovary with 1 ovule in each loculus [175. Rapateaceae](#)
- Anthers opening by longitudinal slits; flowers actinomorphic or zygomorphic, in lax or dense cymes or panicles often subtended by spathaceous bracts; petals free or united below; stamens 6, all or only 2-5 fertile; ovary with 1 or more ovules in each loculus [172. Commelinaceae](#)

Group 3

- 1 Perianth-segments dry and glumaceous, free; flowers small, clustered in lax or dense (sometimes head-like) terminal panicles; leaves narrow or reduced to sheaths; rushes [200. Juncaceae](#)
- Perianth-segments petaloid or herbaceous, free or united: **2**
- 2 Aquatic herbs; leaves with a lanceolate to ovate-orbicular lamina, or linear and submerged; flowers solitary or in spikes or racemes; perianth-segments free or united below into a tube [184. Pontederiaceae](#)
- Plants terrestrial: **3**
- 3 Leaves reduced to spines, their function fulfilled, by leaf-like acicular or flattened branches (cladodes); herbs or shrubs, often climbing [182. Liliaceae](#)
- Leaves well developed, sometimes appearing after the flowers: **4**
- 4 Inflorescence a spadix enclosed in a spathe; ovary 1-2-locular; leaves radical, with a cordate or sagittate or hastate lamina [186. Araceae](#)
- Inflorescence not a spadix enclosed in a spathe; ovary 3-locular: **5**
- 5 Flowers dioecious, small, in axillary umbels; leaves with reticulate venation and stipular tendrils; climbing shrubs with prickly branches [185. Smilacaceae](#)
- Flowers bisexual; leaves without stipular tendrils: **6**
- 6 Ovary with 2 or more ovules in each loculus; fruit a loculicidal or septicidal capsule; herbs, sometimes climbing [182. Liliaceae](#)
- Ovary with 1 ovule in each loculus; fruit not a capsule: **7**
- 7 Perianth-segments free; fruit a drupe; climbing herbs, the leaves ending in tendrils [173. Flagellariaceae](#)
- Perianth-segments united below into a tube; fruit a berry or with a thin pericarp falling away from the berry-like seeds; herbs or shrubs or trees, sometimes climbing, the leaves not ending in tendrils [192. Agavaceae](#)

Group 4

- 1 Leaves absent; minute aquatic herbs, the plant body reduced to a thallus-like "frond" with or without 1 or more pendent rootlets [187. Lemnaceae](#)
- Leaves (or solitary leaf) present, well developed, sometimes appearing after the flowers: **2**
- 2 Leaves (or solitary leaf) petiolate, sometimes 3-partite or much divided, the lamina if undivided often cordate or sagittate or hastate; inflorescence a spadix subtended by or enclosed in a spathe, sometimes with a terminal sterile appendix above the flowers; flowers small, unisexual or sometimes bisexual; herbs or woody climbers, sometimes epiphytic or aquatic [186. Araceae](#)
- Leaves sessile, simple and undivided, not cordate or sagittate or hastate; flowers unisexual: **3**
- 3 Leaves opposite, linear, coarsely or minutely toothed, borne on elongated stems; flowers solitary or few together in the axils of the leaves; submerged aquatic herbs [171. Najadaceae](#)
- Leaves alternate; flowers in spikes or heads: **4**
- 4 Trees with aerial roots; leaves broadly linear, armed with spiny teeth on the margin and often also on the midrib beneath [194. Pandanaceae](#)
- Herbs, often aquatic; leaves without spiny teeth: **5**
- 5 Floating aquatic plants; leaves obovate or oblong-spathulate, hairy, arranged in a cup-like rosette; inflorescence a spadix enclosed in a spathe and adnate to it below, with 1 female flower at the base and several male flowers above [186. Araceae](#)
- Plants not floating; leaves linear or filiform, glabrous: **6**
- 6 Flowers in bracteate heads; ovary 2-3-locular with 1 ovule in each loculus; style branched, with 2-3 filiform stigmas [176. Eriocaulaceae](#)
- Flowers in dense cylindric spikes, the female below, the male above; ovary 1-locular with 1 ovule; style simple, unbranched, with 1 stigma [188. Typhaceae](#)

Group 5

- 1 Florets each enclosed by a bract (lemma) on the outside and a bracteole (palea) on the inside, the spikelet often having 2 empty bracts (glumes) at its base; perianth absent or represented by 2-3 minute scales (lodicules); stems terete or compressed and often with hollow internodes; seed adnate to or sometimes free from the pericarp of the fruit; grasses, herbaceous or sometimes woody (bamboos) [202. Gramineae](#)

KEY TO THE FAMILIES OF MONOCOTYLEDONS

Florets each enclosed by a single bract (glume) on the outside, without a bracteole or female florets each surrounded by a closed bracteole (utricle); perianth absent or represented by bristles or scales; stems often triquetrous and often solid; seed free from the pericarp of the fruit; sedges, herbaceous or sometimes arborescent[201. Cyperaceae](#)

Group 6

- 1 Aquatic herbs with submerged leaves:[2](#)
Plants terrestrial:.....[3](#)
- 2 Perianth composed of 3 free sepals and 3 free petals, or the petals sometimes vestigial or absent; flowers bisexual or dioecious, borne in 1- or more-flowered tubular spathes; ovary 1-locular with parietal placentas; styles 3 or more, simple or 2-branched[164. Hydrocharitaceae](#)
Perianth composed of 6 similar petaloid segments united below into an elongated tube; flowers bisexual, borne in few-flowered umbels subtended by 2 free spathaceous bracts; ovary 3-locular with axile placentas; style 1, simple[189. Amaryllidaceae](#)
- 3 Fertile stamens 5; flowers bisexual or unisexual, zygomorphic, in clusters subtended by large spathaceous bracts; perianth 2-lipped, the median inner segment free, the others united into a 3-5-toothed sheath; tall herbaceous plants with large leaves[178. Musaceae](#)
Fertile stamens 3 or 6:[4](#)
- 4 Flowers unisexual, small; leaves simple or digitate, with reticulate venation; fruit a 3-winged capsule; climbing plants[191. Dioscoreaceae](#)
Flowers bisexual:.....[5](#)
- 5 Leaves deeply divided with pinnately lobed segments, radical; flowers in bracteate umbels, the outer bracts broad, the inner bracts long and filiform; herbs with a tuberous rootstock[197. Taccaceae](#)
Leaves (or solitary leaf) simple and undivided, sometimes reduced to scales:[6](#)
- 6 Stamens 3:[7](#)
Stamens 6:[8](#)
- 7 Stamens opposite to the inner perianth-segments; flowers actinomorphic; perianth-segments united below into a tube; saprophytic herbs with a few narrow basal leaves or the leaves all reduced to scales [198. Burmanniaceae](#)
Stamens opposite to the outer perianth-segments; flowers actinomorphic or zygomorphic; perianth-segments free or united below into a tube; narrow-leaved herbs with a cormous or rhizomatous rootstock, not saprophytic[190. Iridaceae](#)
- 8 Saprophytic herbs, the leaves reduced to scales; ovary 1-locular with 3 parietal placentas; perianth with an inflated tube[198. Burmanniaceae](#)
Plants not saprophytic, the leaves (or solitary leaf) well developed; ovary 3-locular:.....[9](#)
- 9 Flowers in umbels (sometimes 1-flowered) subtended by 1 or more spathaceous bracts and borne on naked peduncles; herbs with a bulbous rootstock and radical leaves[189. Amaryllidaceae](#)
Flowers solitary or in racemes or fascicles not subtended by spathaceous bracts; rootstock not a bulb: [10](#)
- 10 Anthers opening by an apical pore; ovary semi-inferior, with 2 ovules in each loculus; herbs with a cormous rootstock, each corm bearing a solitary petiolate ovate-cordate leaf[183. Tecophilaeaceae](#)
Anthers opening by longitudinal slits; ovary with numerous ovules in each loculus; leaves not solitary or ovate-cordate:..... [11](#)
- 11 Perianth composed of 3 free sepals and 3 longer free petals; ovary semi-inferior; herbs with flowers in racemes[177. Bromeliaceae](#)
Perianth composed of 6 subequal segments free or united below into a slender tube; ovary completely inferior: [12](#)
- 12 Anthers sagittate; perianth (at least the outer segments) hairy outside; ovules 2-seriate on axile placentas; herbs with a cormous or tuberous rootstock[195. Hypoxidaceae](#)
Anthers not sagittate; perianth glabrous outside; ovules multiseriate on axile placentas intruded into the loculi; plants with a woody stem densely covered with the persistent bases of fallen leaves[196. Velloziaceae](#)

Group 7

- 1 Stamen not accompanied by petaloid staminodes; pollen agglutinated into masses (pollinia); ovary 1-locular with numerous ovules on parietal placentas; flowers zygomorphic, the median petal (lip or labellum) more or less different from the lateral petals; terrestrial or epiphytic herbs, sometimes climbing or saprophytic[199. Orchidaceae](#)
Stamen accompanied by 1 or more petaloid staminodes; pollen granular, not agglutinated into masses; terrestrial herbs:.....[2](#)
- 2 Calyx tubular; flowers zygomorphic; stamen with a 2-theous anther, the filament sometimes petaloid; ovary 3-locular with numerous ovules in each loculus[179. Zingiberaceae](#)

KEY TO THE FAMILIES OF MONOCOTYLEDONS

Calyx composed of 3 free sepals; flowers asymmetric; stamen semi-staminodial with a 1-theous anther, the staminodial part petaloid:**3**

3 Ovary 3-locular with numerous ovules in each loculus [180. Cannaceae](#)

Ovary 1-3-locular with 1 ovule in each loculus [181. Marantaceae](#)

KEY TO THE FAMILIES OF DICOTYLEDONS

KEY TO THE FAMILIES OF DICOTYLEDONS

By J. E. Dandy

(This key is specially designed to cover plants represented in this Flora. The basic arrangement is that of Hutchinson, *The Families of Flowering Plants*, ed. 2, vol. I, Dicotyledons, Oxford, 1959.)

Key to Groups

- 1 Gynoecium composed of 2 or more free or almost free carpels with separate styles and stigmas :.....2
Gynoecium composed of 1 carpel or of 2 or more united carpels with free or united styles and stigmas, or if carpels free below then the styles or stigmas united into 1 :.....3
- 2 Petals present, free at least at the base..... [Group 1](#)
Petals present, all united at least at the base [Group 2](#)
Petals absent..... [Group 3](#)
- 3 Ovules 2 or more in the gynoecium, attached to the wall or walls of the ovary (placentation parietal) :4
Ovules 1 or more in the gynoecium, if more than 1 then attached to the central axis or the base or apex of the ovary :7
- 4 Ovary superior :.....5
Ovary inferior or semi-inferior :.....6
- 5 Petals present, free at least at the base..... [Group 4](#)
Petals present, all united at least at the base [Group 5](#)
Petals absent..... [Group 6](#)
- 6 Petals present, free at least at the base..... [Group 7](#)
Petals present, all united at least at the base [Group 8](#)
Petals absent..... [Group 9](#)
- 7 Ovary superior :.....8
Ovary inferior or semi-inferior :.....9
- 8 Petals present, free at least at the base..... [Group 10](#)
Petals present, all united at least at the base [Group 11](#)
Petals absent..... [Group 12](#)
- 9 Petals present, free at least at the base..... [Group 13](#)
Petals present, all united at least at the base [Group 14](#)
Petals absent..... [Group 15](#)

Group 1

- 1 Leaves opposite, simple ; stamens and carpels as many as the petals ; herbs, often succulent [24. Crassulaceae](#)
Leaves alternate:.....2
- 2 Sepals 6–18 in 2 or more series, free or the inner ones united ; flowers dioecious, small ; leaves simple or sometimes 3-foliolate ; woody climbers or sometimes erect shrubs or small trees [12. Menispermaceae](#)
Sepals 5 or fewer in 1 series, free or united, sometimes forming a spatheous calyx :3
- 3 Leaves all or mostly compound with 3 or more leaflets :4
Leaves simple or 1-foliolate, sometimes lobed or deeply divided. :8
- 4 Stamens numerous, more than twice as many as the petals ; carpels indefinite in number, often numerous ; leaves with stipules or sheathing at the base ; leaflets toothed or lobed :5
Stamens as many or twice as many as the petals ; carpels 2–5 ; leaves without stipules, not sheathing at the base ; leaflets entire or crenate ; trees or shrubs, sometimes climbing :6
- 5 Shrubs, erect or scrambling, with prickles ; sepals united below ; petals and stamens perigynous, inserted at the mouth of the calyx-tube ; carpels with 2 ovules, drupaceous in fruit [87. Rosaceae](#)
Herbs, without prickles ; sepals free ; petals and stamens hypogynous, not inserted on the calyx ; carpels with 1 ovule, achenial in fruit..... [9. Ranunculaceae](#)

KEY TO THE FAMILIES OF DICOTYLEDONS

- 6 Flowers bisexual ; stamens twice as many as the petals ; leaves pinnate or 1-3-foliolate[122. Connaraceae](#)
 Flowers unisexual or polygamous ; stamens as many as the petals ; leaves pinnate :7
- 7 Leaflets dotted with pellucid glands ; carpels with 2 ovules ; branches armed with prickles [114. Rutaceae](#)
 Leaflets without pellucid glands ; carpels with 1 ovule ; branches unarmed [115. Simaroubaceae](#)
- 8 Sepals valvate or forming a spathaceous calyx ; trees or shrubs, sometimes climbing :9
 Sepals imbricate, not forming a spathaceous calyx : 11
- 9 Leaves without stipules ; petals 6 in 2 series, or 6 or 4 or 3 in 1 series ; anthers commonly with a prolongation of the connective above the thecae [4. Annonaceae](#)
 Leaves with stipules ; petals 5 in 1 series ; anthers without a prolongation of the connective above the thecae :10
- 10 Flowers bisexual, with an androgynophore bearing the stamens and carpels at its apex ; stamens accompanied on the inside by 5 petaloid staminodes [75. Sterculiaceae](#)
 Flowers unisexual, without an androgynophore ; stamens not accompanied by petaloid staminodes [74. Tiliaceae](#)
- 11 Herbs ; leaves palmately lobed or deeply divided ; flowers zygomorphic ; sepals petaloid, the median (adaxial) one spurred at the base ; upper (adaxial) pair of petals spurred at the base, the spurs fitting into the calyx-spur [9. Ranunculaceae](#)
 Trees or shrubs, sometimes climbing ; leaves entire or toothed ; flowers actinomorphic ; sepals and petals not spurred : 12
- 12 Stamens twice as many as the petals ; carpels with 2 ovules.....[122. Connaraceae](#)
 Stamens numerous, more than twice as many as the petals ; carpels with several (more than 2) ovules[49. Dilleniaceae](#)

Group 2

- 1 Leaves opposite or the lower ones peltate ; corolla-lobes 4–5, as many as the sepals or calyx-lobes ; corolla-tube often longer than the lobes ; herbs or shrubs, often succulent [24. Crassulaceae](#)
 Leaves alternate, not peltate ; corolla-lobes 6, twice as many as the sepals ; corolla- tube much shorter than the lobes ; trees or shrubs, sometimes climbing [4. Annonaceae](#)

Group 3

- 1 Flowers zygomorphic, unisexual, the perianth produced unilaterally into an elongated lobe ; anthers opening by upcurving valves ; carpels sunk in the receptacle ; trees or shrubs [5. Monimiaceae](#)
 Flowers actinomorphic ; anthers opening by slits ; carpels not sunk in the receptacle :2
- 2 Stamens united into a column or synandrium ; flowers unisexual :3
 Stamens free :4
- 3 Leaves with stipules ; sepals or calyx-lobes 3-8 in 1 series ; trees or shrubs..... [75. Sterculiaceae](#)
 Leaves without stipules ; sepals 6-12 in 2 or more series ; woody climbers..... [12. Menispermaceae](#)
- 4 Sepals united below ; stamens perigynous, inserted at the mouth of the calyx-tube ; leaves all or mostly compound or palmately lobed, with stipules ; shrubs or herbs, sometimes scrambling with prickles[87. Rosaceae](#)
 Sepals free ; stamens hypogynous, not inserted on the calyx :5
- 5 Leaves all or mostly compound ; sepals more or less petaloid ; herbs or woody climbers or trailers [9. Ranunculaceae](#)
 Leaves simple ; sepals not petaloid :6
- 6 Herbs with opposite or subopposite leaves ; flowers bisexual or unisexual [30. Molluginaceae](#)
 Woody climbers with alternate leaves ; flowers dioecious :7
- 7 Sepals 6-18 in 2 or more series ; stamens 3-6 ; flowers in clustered cymes [12. Menispermaceae](#)
 Sepals 5 in 1 series ; stamens 10-15 ; flowers in elongated racemes[35. Phytolaccaceae](#)

Group 4

- 1 Gynoecium composed of 1 carpel, thus with only 1 placenta in the ovary :2
 Gynoecium composed of 2 or more united carpels, thus with 2 or more placentas in the ovary :9

KEY TO THE FAMILIES OF DICOTYLEDONS

- 2 Leaves 2-pinnate, with stipules or stipular spines :3
- Leaves simple or 1-pinnate or 1-3-foliolate :4
- 3 Petals valvate, sometimes coherent above the base ; flowers in heads or spikes or spike-like racemes ; trees or shrubs or herbs, sometimes climbing or aquatic.....[90. Mimosaceae](#)
- Petals imbricate ; flowers in lax or dense racemes or spikes, sometimes paniculate ; trees or shrubs, sometimes climbing[89. Caesalpiniaceae](#)
- 4 Flowers zygomorphic ; leaves simple or compound ; trees or shrubs or herbs, sometimes climbing:.....5
- Flowers actinomorphic :6
- 5 Corolla papilionaceous; petals 5, the uppermost (adaxial) one outside the others in bud, the lower (abaxial) pair forming a carina enclosing the stamens and ovary[91. Papilionaceae](#)
- Corolla not papilionaceous ; petals 1–6, the uppermost (adaxial) one often inside the others in bud, the lower ones not forming a carina[89. Caesalpiniaceae](#)
- 6 Leaves with stipules :7
- Leaves without stipules ; trees or shrubs, sometimes climbing :8
- 7 Stamens as many as and opposite to the petals, the filaments united below into a tube ; ovary with 2 ovules ; leaves simple, toothed ; herbs or shrublets[75. Sterculiaceae](#)
- Stamens more numerous than the petals, or as many as the petals and alternating with them, free or the filaments united towards the base ; ovary with 2 or more ovules ; leaves simple or pinnate or 2-foliolate ; trees or shrubs[89. Caesalpiniaceae](#)
- 8 Flowers bisexual; stamens as many as the petals, not accompanied by staminodes; leaves pinnate or 3-foliolate, the leaflets dotted with pellucid glands ; branches often armed with prickles[114. Rutaceae](#)
- Flowers unisexual; stamens twice as many as the petals, or as many as the petals and alternating with staminodes ; leaves pinnate or 1–3-foliolate, without pellucid glands ; branches unarmed[122. Connaraceae](#)
- 9 Stamens 6, tetradynamous (the outer 2 shorter than the inner 4) ; sepals 4 ; petals 4 or fewer ; ovary divided by a false septum connecting the 2 placentas ; herbs, sometimes aquatic[19. Cruciferae](#)
- Stamens 2 or more, if 6 then not tetradynamous :10
- 10 Leaves all or mostly compound :11
- Leaves simple (sometimes lobed) or absent :14
- 11 Leaves 1-3-pinnate ; trees or shrubs :12
- Leaves digitate, or mostly digitate and some 1-foliolate :13
- 12 Leaves 2-3-pinnate ; flowers zygomorphic ; stamens as many as the petals, free, alternating with staminodes[18. Moringaceae](#)
- Leaves 1-pinnate ; flowers actinomorphic ; stamens twice as many as the petals, the filaments united into a tube, not accompanied by staminodes[118. Meliaceae](#)
- 13 Styles 3, free or united at the base ; ovary subsessile ; stamens as many as the petals, surrounded by a fimbriate corona ; flowers actinomorphic ; climbing shrubs with tendrils.....[58. Passifloraceae](#)
- Style 1 or stigma sessile ; ovary often borne on an elongated gynophore ; stamens numerous or few, sometimes accompanied by staminodes but not surrounded by a fimbriate corona ; flowers actinomorphic or zygomorphic ; trees or shrubs or herbs, sometimes climbing, without tendrils[17. Capparidaceae](#)
- 14 Flowers unisexual :15
- Flowers bisexual :20
- 15 Leaves opposite ; stamens numerous, united into 5 spatulate bundles opposite to the petals ; trees.....[72. Guttiferae](#)
- Leaves alternate :16
- 16 Petals in the male flowers united into an elongated tube, free in the female flowers ; stamens twice as many as the corolla-lobes, inserted at the mouth of the corolla- tube ; trees with palmately lobed leaves.....[61. Caricaceae](#)
- Petals free in both the male and female flowers :17
- 17 Stamens more numerous than the petals ; trees or shrubs, sometimes climbing :18
- Stamens as many as the petals :19
- 18 Ovary borne on an elongated gynophore ; sepals 4 ; branches armed with stipular spines[17. Capparidaceae](#)
- Ovary sessile or shortly stipitate ; sepals 2-5 ; branches unarmed.....[53. Flacourtiaceae](#)
- 19 Petals smaller than the sepals ; leaves with 1–2 glands at the top of the petiole, the lamina sometimes palmately lobed ; herbaceous or woody climbers with tendrils[58. Passifloraceae](#)
- Petals larger than the sepals ; leaves without glands at the top of the petiole, the lamina unlobed ; trees or shrubs, without tendrils.....[50. Pittosporaceae](#)

KEY TO THE FAMILIES OF DICOTYLEDONS

- 20 Stamens as many as the petals : 21
- 21 Herbaceous or woody climbers with tendrils ; flowers with a fimbriate corona outside the stamens ; leaves entire or 3-lobed [58. Passifloraceae](#)
Plants without tendrils ; flowers with or without a corona : 22
- 22 Style 1, elongated and unbranched : 23
Styles 3-5, free or united below, sometimes branched : 25
- 23 Stamens alternating with petaloid staminodes, surrounded by an outer series of filiform staminodes ; leaves with pectinate stipules ; herbs..... [63. Ochnaceae](#)
Stamens not accompanied by staminodes : 24
- 24 Connective of the anthers prolonged above the thecae into an appendage ; leaves with stipules ; flowers actinomorphic or zygomorphic ; trees or shrubs or herbs..... [20. Violaceae](#)
Connective of the anthers not prolonged above the thecae ; leaves without stipules; flowers actinomorphic ; trees or shrubs..... [50. Pittosporaceae](#)
- 25 Leaves bearing numerous sticky stipitate glands ; styles 3, deeply 2-branched : 26
- 26 insectivorous herbs..... [26. Droseraceae](#)
Leaves without sticky stipitate glands ; styles unbranched ; plants not insectivorous : 27
- 27 Flowers with a hairy fimbriate corona outside the stamens ; stigmas capitate : 28
Stamens more numerous than the petals : 30
- 28 trees or shrubs [58. Passifloraceae](#)
Flowers without a corona but sometimes with a hairy scale at the base of each petal ; stigmas not capitate : ... 29
- 29 Herbs ; sepals united below into a tube ; seeds arillate at the base ; leaves often pinnately lobed . 16. Turneraceae
Trees ; sepals free ; seeds not arillate ; leaves unlobed..... [53. Flacourtiaceae](#)
- 30 Flowers zygomorphic : 31
Flowers actinomorphic : 32
- 31 Sepals 5-6 ; petals at least the upper (adaxial) ones lacinate ; fruit a capsule gaping at the apex ; leaves entire or 3-lobed ; herbs with flowers in dense terminal racemes [21. Resedaceae](#)
Sepals 4 ; petals not lacinate ; fruit indehiscent or dehiscent throughout its length by 2 valves ; leaves entire or sometimes absent ; herbs or shrubs [17. Capparidaceae](#)
- 32 Leaves opposite ; herbs : 33
Leaves alternate : 34
- 33 Sepals free ; stamens numerous ; styles 2-4, free ; leaves dotted with minute pellucid glands.... [71. Hypericaceae](#)
Sepals united below into a tube ; stamens 6 ; style 1, 2-4-branched at the apex ; leaves without pellucid glands [56. Frankeniaceae](#)
- 34 Anthers opening at the top by 1-2 pores or short pore-like slits : 35
Anthers opening by longitudinal slits : 37
- 35 Leaves palmately lobed ; seeds covered with long cottony hairs ; shrubs or shrublets [52. Cochlospermaceae](#)
Leaves not palmately lobed ; seeds without long hairs ; trees or shrubs : 36
- 36 Anthers horseshoe-shaped, opening at the top of the bend ; sepals 5, caducous, leaving large persistent glands at the base of the flower ; fruit a 2-valved bristly capsule [51. Bixaceae](#)
Anthers straight, opening at the apex ; sepals 3 ; fruit a 5-8-valved smooth or prickly capsule [53. Flacourtiaceae](#)
- 37 Leaves pinnately lobed ; sepals 2-3, horned at the apex, caducous ; fruit a capsule dehiscent by short valves at the top ; prickly herbs..... [15. Papaveraceae](#)
Leaves not pinnately lobed : 38
- 38 Ovary borne on an elongated gynophore ; trees or shrubs, often climbing or scrambling with stipular spines [17. Capparidaceae](#)
Ovary sessile or subsessile : 39
- 39 Herbs ; stamens 6 ; flowers in racemes [77. Capparidaceae](#)
Trees or shrubs, sometimes climbing ; stamens 10 or more : 40
- 40 Stamens 10, twice as many as the petals ; seeds few, large, disciform, with an annular wing, developing in the open capsule ; leaves often 2-hooked at the apex, or sometimes reduced to the midrib bearing stipitate glands ; climbing shrubs [54. Dioncophyllaceae](#)
Stamens numerous, more than twice as many as the petals ; seeds unwinged, with apical hooks, not reduced to the midrib ; erect shrubs or trees : 41

KEY TO THE FAMILIES OF DICOTYLEDONS

- 41 Stamens arranged in bundles opposite to the petals ; petals twice as many as the sepals ; styles 3-4 [55. *Samydaceae*](#)
- Stamens not arranged in bundles ; petals as many as the sepals or more numerous ; styles 1-5 : 42
- 42 Flowers with a fimbriate or hairy corona outside the stamens..... [58. *Passifloraceae*](#)
- Flowers without a corona but sometimes with a hairy scale at the base of each petal [53. *Flacourtiaceae*](#)

Group 5

- 1 Gynoecium composed of 1 carpel, thus with only 1 placenta in the ovary ; leaves compound, with stipules or stipular spines ; flowers in heads or spikes or spike-like racemes : 2
- Gynoecium composed of 2 or more united carpels, thus with 2 or more placentas in the ovary ; leaves simple or 1-pinnate, without stipules, sometimes reduced to scales : 3
- 2 Leaves 3-foliolate ; corolla zygomorphic, papilionaceous, with imbricate lobes, the uppermost (adaxial) lobe outside the others in bud, the lowest (abaxial) pair of lobes forming a carina enclosing the stamens and ovary ; herbs [91. *Papilionaceae*](#)
- Leaves 2-pinnate ; corolla actinomorphic, with valvate lobes ; trees or shrubs or herbs, sometimes climbing [90. *Mimosaceae*](#)
- 3 Flowers zygomorphic ; stamens fewer than the corolla-lobes, inserted on the corolla- tube : 4
- Flowers actinomorphic ; stamens as many as the corolla-lobes or more numerous : 6
- 4 Leaves reduced to scales ; fleshy herbs parasitic on roots ; stamens 4 [154. *Orobanchaceae*](#)
- Leaves (or solitary leaf) well developed ; plants not parasitic : 5
- 5 Trees ; leaves pinnate ; stamens 4 ; fruit large, subcylindric, indehiscent [157. *Bignoniaceae*](#)
- Herbs, sometimes epiphytic ; leaves (or solitary leaf) simple ; stamens 2 or 4 ; fruit a capsule [156. *Gesneriaceae*](#)
- 6 Flowers unisexual, the petals united into a tube in the male flowers but often free in the female flowers ; leaves palmately lobed ; trees..... [61. *Caricaceae*](#)
- Flowers bisexual ; leaves not palmately lobed : 7
- 7 Stamens more numerous than the corolla-lobes, not inserted on the corolla; corolla- lobes twice as many as the sepals or calyx-lobes or more numerous ; trees or shrubs with alternate leaves : 8
- Stamens as many as the corolla-lobes, inserted on the corolla-tube ; corolla-lobes as many as the sepals or calyx-lobes : 9
- 8 Corolla-lobes 6 in 1 series or in 2 unequal series ; anthers subsessile, with a broad prolongation of the connective above the thecae ; ovary with numerous ovules and sessile radiating stigmas [4. *Annonaceae*](#)
- Corolla-lobes more than 10 in 3-4 irregular series ; anthers borne on elongated filaments, without a prolongation of the connective above the thecae ; ovary with 4 ovules and a 2-branched style [128. *Hoplostigmataceae*](#)
- 9 Leaves alternate, the lamina cordate-orbicular ; corolla-lobes induplicate-valvate : aquatic herbs [141. *Menyanthaceae*](#)
- Leaves opposite, sometimes reduced to scales ; corolla-lobes contorted ; plants terrestrial : 10
- 10 Trees or shrubs, often climbing, sometimes with tendrils ; fruit a large berry..... [134. *Apocynaceae*](#)
- Herbs, sometimes saprophytic with the leaves reduced to scales ; fruit a septicidal capsule..... [140. *Gentianaceae*](#)

Group 6

- 1 Leaves opposite ; fruit a circumscissile capsule ; herbs..... [31. *Ficoidaceae*](#)
- Leaves alternate ; fruit not circumscissile : 2
- 2 Gynoecium composed of 1 carpel, thus with only 1 placenta in the ovary ; leaves pinnate or 1-3-foliolate, with stipules ; trees or shrubs [89. *Caesalpinaceae*](#)
- Gynoecium composed of 2 or more united carpels, thus with 2 or more placentas in the ovary : 3
- 3 Herbs ; leaves pinnate ; fruit a 2-valved silique..... [19. *Cruciferae*](#)
- Trees or shrubs ; leaves simple : 4
- 4 Perianth absent ; flowers in catkins, unisexual ; seeds with a basal tuft of long fine hairs [93. *Salicaceae*](#)
- Perianth present ; flowers not in catkins ; seeds without a tuft of long fine hairs : 5
- 5 Ovary borne on an elongated gynophore ; stigma sessile or terminating a short style [17. *Capparidaceae*](#)
- Ovary sessile : 6
- 6 Style 1 ; sepals more or less united below ; stamens perigynous, inserted at the mouth of the calyx-tube ; flowers bisexual ; branches unarmed [55. *Samydaceae*](#)
- Styles 2-6, free or united at the base ; sepals free ; stamens hypogynous, not inserted on the calyx ; flowers

KEY TO THE FAMILIES OF DICOTYLEDONS

bisexual or unisexual ; branches often armed with spines[53. Flacourtiaceae](#)

Group 7

- 1 Flowers unisexual ; stamens 3–5, the anthers straight or flexuous or folded ; climbing or trailing herbs or shrubs with tendrils ; leaves often palmately lobed or divided[59. Cucurbitaceae](#)
Flowers bisexual ; stamens with straight anthers ; plants without tendrils :[2](#)
- 2 Leaves absent or reduced to scales ; succulent shrubs, sometimes epiphytic[62. Cactaceae](#)
Leaves present, well developed, not reduced to scales :[3](#)
- 3 Aquatic herbs ; leaves peltate, cordate, long-petiolate ; flowers solitary, long-pedunculate, large and conspicuous ; petals and stamens numerous ; ovary multilocular[11. Nymphaeaceae](#)
Trees or shrubs ; leaves not peltate ; flowers grouped in inflorescences ; petals 5-8, persistent and often accrescent in fruit ; stamens arranged singly or in bundles opposite to the petals ; ovary 1-locular[55. Samydaceae](#)

Group 8

- 1 Flowers unisexual ; leaves alternate, often lobed or divided or sometimes digitate or pedate ; stamens 3-5, the anthers straight or curved or flexuous or folded ; climbing or trailing herbs or shrubs with tendrils[59. Cucurbitaceae](#)
Flowers bisexual ; leaves opposite or verticillate, simple, entire, with interpetiolar stipules ; stamens with straight anthers ; trees or shrubs, sometimes climbing but without tendrils[137. Rubiaceae](#)

Group 9

- 1 Herbs or shrubs, often climbing, with alternate simple leaves ; perianth with an elongated tube inflated below, the mouth 2-6-lobed or produced unilaterally into a single lobe ; stamens 6-24, the anthers adnate to the style[13. Aristolochiaceae](#)

Group 10

- 1 Ovary 1-locular, sometimes septate towards the base :[2](#)
Ovary 2- or more-locular, completely or almost completely septate :[31](#)
- 2 Leaves compound :[3](#)
Leaves simple :[6](#)
- 3 Flowers bisexual ; leaves 1-2-pinnate, with stipules :[4](#)
Flowers unisexual ; leaves 1-pinnate or 3-foliolate, without stipules ; trees or shrubs, sometimes climbing :[5](#)
- 4 Herbs ; corolla papilionaceous, the uppermost (adaxial) petal outside the others in bud, the lowest pair forming a carina enclosing the stamens and ovary ; stamens diadelphous, the uppermost (adaxial) one free, the filaments of the others united into a sheath ; leaves 1-pinnate[91. Papilionaceae](#)
Trees ; corolla not papilionaceous, the uppermost (adaxial) petal inside the others in bud, the lower ones not forming a carina ; stamens free or the filaments shortly united at the base ; leaves 1-2-pinnate[89. Caesalpiniaceae](#)
- 5 Ovary with 2 ovules ; leaflets dotted with pellucid glands[114. Rutaceae](#)
Ovary with 1 ovule ; leaflets without pellucid glands[121. Anacardiaceae](#)
- 6 Leaves opposite or verticillate :[7](#)
Leaves alternate :[12](#)
- 7 Herbs ; ovary with 3 or more ovules on a free-basal or free-central placenta :[8](#)
Trees or shrubs ; ovary with 1-2 ovules :[10](#)
- 8 Leaves with stipules[29. Caryophyllaceae](#)
Leaves without stipules :[9](#)
- 9 Petals and stamens perigynous, inserted on the calyx-tube ; style 1[47. Lythraceae](#)
Petals and stamens hypogynous or subhypogynous, not inserted on the calyx ; styles 2-6[29. Caryophyllaceae](#)
- 10 Flowers unisexual or polygamous ; styles 3, free or united at the base ; stamens as many as and alternating with the petals or twice as many, free[121. Anacardiaceae](#)
Flowers bisexual ; style 1 :[11](#)

KEY TO THE FAMILIES OF DICOTYLEDONS

- 11 Leaves with stipules ; stamens as many as and opposite to the petals, free ; ovules 2, erect from the base of the ovary [112. Rhamnaceae](#)
 Leaves without stipules ; stamens numerous, united into 5 bundles fused to form a 5-lobed tube surrounding the ovary ; ovule 1, pendulous from the apex of the ovary [71. Hypericaceae](#)
- 12 Leaves peltate or subpeltate ; woody climbers with small dioecious flowers [12. Menispermaceae](#)
 Leaves not peltate : 13
- 13 Stamens as many as and opposite to the petals ; trees or shrubs, sometimes climbing : 14
 Stamens as many as and alternating with the petals, or more numerous or fewer : 19
- 14 Stamens alternating with as many or fewer staminodes : 15
 Stamens not accompanied by staminodes : 16
- 15 Petals imbricate ; staminodes much longer than the petals ; ovary with 6–8 ovules pendulous from the apex of a free-central axis ; styles 3–4, short [107. Medusandraceae](#)
 Petals valvate ; staminodes shorter than the petals ; ovary with 3 ovules pendulous from the apex of a free-basal placenta ; style 1 [104. Olacaceae](#)
- 16 Leaves with stipules ; ovary with 1-2 basal ovules [112. Rhamnaceae](#)
 Leaves without stipules : 17
- 17 Petals imbricate ; flowers unisexual or polygamous [130. Myrsinaceae](#)
 Petals valvate ; flowers bisexual : 18
- 18 Stamens united into a tube surrounding the ovary ; anthers opening by down- curving valves ; ovary with 2-3 ovules pendulous from the apex of a free- basal placenta ; fruit surrounded by the persistent accrescent calyx [104. Olacaceae](#)
 Stamens free ; anthers opening by longitudinal slits ; ovary with 1 ovule pendulous from the apex of a free-basal placenta ; fruit not surrounded by a persistent calyx [106. Opiliaceae](#)
- 19 Ovary with 1 ovule : 20
 Ovary with 2 or more ovules : 24
- 20 Perianth zygomorphic, the lowest (abaxial) petal or pair of petals forming a carina enclosing the stamens and ovary : 21
 Perianth actinomorphic, the petals not forming a carina : 22
- 21 Herbs ; leaves with stipules ; carina composed of 2 coherent petals ; fruit not winged [91. Papilionaceae](#)
 Trees or shrubs, sometimes climbing ; leaves without stipules ; carina composed of 1 petal ; fruit with an elongated subterminal wing [22. Polygalaceae](#)
- 22 Leaves with stipules ; ovary with 3 subsessile stigmas ; herbs [34. Illecebraceae](#)
 Leaves without stipules ; ovary with 1-3 styles : 23
- 23 Flowers bisexual, in involucre heads or solitary or few together in the axils of the leaves ; petals and stamens perigynous, inserted high up on the elongated calyx-tube ; stamens twice as many as the petals, not accompanied by staminodes ; herbs or shrubs or trees [46. Thymelaeaceae](#)
 Flowers unisexual or polygamous, in lax or dense panicles ; petals and stamens hypogynous, not inserted on the calyx ; stamens as many or twice as many as the petals, or reduced to 1-2 and accompanied by staminodes ; trees or shrubs [121. Anacardiaceae](#)
- 24 Leaves minute, scale-like ; ovary with 3 short styles and numerous ovules on basal placentas ; trees or shrubs [57. Tamaricaceae](#)
 Leaves well developed, not scale-like ; ovary with 1-3 styles : 25
- 25 Petals valvate ; trees or shrubs, sometimes climbing : 26
 Petals imbricate or contorted : 28
- 26 Stamens as many as the petals, not accompanied by staminodes ; ovules 2, pendulous from the apex of the ovary ; flowers bisexual or unisexual [102. Icacinaceae](#)
 Stamens more numerous than the petals, or fewer than the petals and accompanied by staminodes ; ovules 2 or more on a basal or free-basal placenta ; flowers bisexual : 27
- 27 Ovules 6 on a basal placenta ; stamens twice as many as the petals ; flowers solitary or paired in the axils of the leaves [131. Styracaceae](#)
 Ovules 2-4, pendulous from the apex of a free-basal placenta ; stamens twice as many as the petals, or fewer and accompanied by staminodes ; flowers in axillary racemes [104. Olacaceae](#)
- 28 Herbs with fleshy leaves ; sepals 2, free ; flowers in lax terminal racemes or panicles [32. Portulacaceae](#)
 Trees or shrubs, sometimes climbing ; sepals 5 or more, free or united below : 29

KEY TO THE FAMILIES OF DICOTYLEDONS

- 29** Styles 3 ; ovules 6, pendulous from the apex of a free-central axis ; flowers in axillary spikes [107. Medusandraceae](#)
- Style 1 ; ovules 2 or more, basal : **30**
- 30** Sepals free, persistent and accrescent in fruit, 2 becoming wing-like and one of these much larger than the other ; petals and stamens hypogynous, not inserted on the calyx ; ovary central, with a terminal style and numerous ovules [63. Ochnaceae](#)
- Sepals united below, not becoming wing-like in fruit ; petals and stamens perigynous, inserted at the mouth of the calyx-tube ; ovary central or inserted laterally on the calyx-tube, with a terminal or basal style and 2 ovules [87. Rosaceae](#)
- 31** Stamens as many as and opposite to the petals : **32**
- Stamens as many as and alternating with the petals, or more numerous or fewer : **37**
- 32** Filaments united at least below into a tube or cup and sometimes alternating with staminodes : **33**
- Filaments free, sometimes very short or absent, not alternating with staminodes : **34**
- 33** Leaves with stipules ; anthers opening by longitudinal slits ; fruit a capsule, not surrounded by a persistent calyx ; shrubs or herbs, sometimes climbing [75. Sterculiaceae](#)
- Leaves without stipules ; anthers opening by downcurving valves ; fruit a drupe surrounded by the persistent accrescent calyx ; trees or shrubs [104. Olacaceae](#)
- 34** Ovary with 4–5 ovules in each loculus ; fruit a loculicidal capsule ; herbs [75. Sterculiaceae](#)
- Ovary with 1–2 ovules in each loculus ; fruit a berry or drupe : **35**
- 35** Ovules 2 in each loculus ; inflorescences leaf-opposed, sometimes pseudo-axillary ; leaves simple (sometimes palmately lobed) or digitate or pedate, sometimes caducous ; herbs or shrubs, often climbing or trailing with tendrils [113. Ampelidaceae](#)
- Ovule 1 in each loculus ; inflorescences axillary ; leaves simple, undivided ; trees or shrubs without tendrils : **36**
- 36** Leaves with stipules or stipular spines ; ovules erect from the base of the loculi ; fruit not enclosed by an accrescent receptacle [112. Rhamnaceae](#)
- Leaves without stipules or stipular spines ; ovules pendulous from the apex of the loculi or central axis ; fruit wholly or partly enclosed by the accrescent receptacle [104. Olacaceae](#)
- 37** Leaves compound with 2 or more leaflets : **38**
- Leaves simple or 1-foliolate, sometimes lobed or deeply divided : **52**
- 38** Inflorescences bearing tendrils ; leaves pinnate or biternate ; climbing shrubs or herbs [119. Sapindaceae](#)
- Inflorescences without tendrils : **39**
- 39** Anthers 1-theous ; leaves digitate ; trees with large flowers [76. Bombacaceae](#)
- Anthers 2-theous : **40**
- 40** Styles 3–5 : **41**
- Style 1 or stigma sessile : **42**
- 41** Herbs ; flowers bisexual ; petals contorted ; ovary with 1 or more ovules in each loculus ; fruit capsular ; leaves pinnate or 3-foliolate [40. Oxalidaceae](#)
- Trees or shrubs ; flowers unisexual or polygamous ; petals imbricate or valvate ; ovary with 1 ovule in each loculus ; fruit drupaceous ; leaves pinnate [121. Anacardiaceae](#)
- 42** Leaves opposite, pinnate or 2–3-foliolate, with stipules or stipular spines ; herbs or shrublets ; stamens twice as many as the petals [85. Zygophyllaceae](#)
- Leaves alternate ; trees or shrubs, sometimes climbing : **43**
- 43** Leaves with intrapetiolar stipules, pinnate ; flowers zygomorphic, in racemes ; stamens 4–6. [120. Melianthaceae](#)
- Leaves without stipules ; flowers actinomorphic or zygomorphic : **44**
- 44** Filaments united into an entire or lobed tube, the anthers included within the tube or exerted from it ; leaves 1–3-pinnate [118. Meliaceae](#)
- Filaments free : **45**
- 45** Leaflets dotted with pellucid glands ; leaves pinnate or digitately 3–5-foliolate [114. Rutaceae](#)
- Leaflets without pellucid glands : **46**
- 46** Ovary with 2 ovules in each loculus : **47**
- Ovary with 1 ovule in each loculus : **48**
- 47** Leaves paripinnate ; flowers unisexual [119. Sapindaceae](#)
- Leaves imparipinnate or 3-foliolate ; flowers bisexual or unisexual [117. Burseraceae](#)

KEY TO THE FAMILIES OF DICOTYLEDONS

- 48 Ovules erect or ascending from the middle or below the middle of the loculi ; leaves paripinnate or 2-3-foliolate ; flowers unisexual [119. Sapindaceae](#)
- Ovules pendulous from the apex or upper part of the loculi : 49
- 49 Leaves 2-foliolate ; branches often armed with straight spines ; flowers bisexual [85. Zygophyllaceae](#)
- Leaves 3- or more-foliolate ; flowers bisexual or unisexual : 50
- 50 Filaments each with a hairy scale-like appendage at the base ; branches unarmed or armed with hooked prickles [115. Simaroubaceae](#)
- Filaments without a scale-like appendage ; branches unarmed : 51
- 51 Petals 5, hairy ; stamens 10, with hairy filaments [115. Simaroubaceae](#)
- Petals 4, glabrous ; stamens 8, with glabrous filaments [121. Anacardiaceae](#)
- 52 Flowers strongly zygomorphic, the median sepal petaloid and produced dorsally into a spur ; median petal free ; lateral petals united into 2 pairs, the pairs free from each other or sometimes coherent ; stamens 5, the anthers united round the ovary ; fruit an explosively dehiscent capsule ; herbs [41. Balsaminaceae](#)
- Flowers actinomorphic or zygomorphic, the sepals not spurred ; petals all free : 53
- 53 Leaves opposite or verticillate, not fasciculate : 54
- 54 Stamens more than twice as many as the petals : 55
- Stamens twice as many as the petals or fewer : 61
- 55 Leaves with free or interpetiolar stipules : 56
- Leaves without stipules : 57
- 56 Trees or shrubs ; petals laciniate at the apex ; stamens 15-45, the filaments not united into bundles [70. Rhizophoraceae](#)
- Herbs ; petals not laciniate ; stamens 15, the filaments united below into 5 bundles of 3 [39. Geraniaceae](#)
- 57 Petals and stamens perigynous, inserted on the calyx-tube ; stamens free ; leaves without glands ; herbs or shrublets [42. Lythraceae](#)
- Petals and stamens hypogynous, not inserted on the calyx ; stamens free or united into 2-5 bundles ; leaves often dotted or streaked with pellucid or opaque glands : 59
- 59 Styles 4-5, free or united in the lower part ; trees or shrubs or herbs ; flowers bisexual [71. Hypericaceae](#)
- Style 1 or stigma sessile ; trees or shrubs : 60
- 60 Fruit a capsule ; style elongated, the stigma small and subentire ; flowers bisexual ; leaves sessile [71. Hypericaceae](#)
- Fruit a berry ; style elongated or short or absent, the stigma disciform or 2-5-lobed ; flowers bisexual or unisexual ; leaves petiolate or sometimes subsessile [72. Guttiferae](#)
- 61 Sepals united below into a tube : 62
- Sepals free or almost free : 65
- 62 Petals and stamens inserted on the calyx-tube ; ovary with numerous ovules in each loculus ; herbs or shrubs or trees ; leaves without stipules : 63
- Petals and stamens not inserted on the calyx ; ovary with 2-4 ovules in each loculus ; trees or shrubs, sometimes climbing : 64
- 63 Anthers opening by an apical pore ; connective often appendaged below the anther ; leaves with 3 or more parallel longitudinal nerves [68. Melastomataceae](#)
- Anthers opening by longitudinal slits ; connective unappendaged ; leaves without parallel longitudinal nerves [42. Lythraceae](#)
- 64 Stamens 10, twice as many as the petals, the filaments free or united into a tube ; leaves with interpetiolar stipules [70. Rhizophoraceae](#)
- Stamens 3, fewer than the petals, the filaments free ; leaves with or without small free stipules [100. Celastraceae](#)
- 65 Ovary with 1 ovule in each fertile loculus (sometimes 1 or 2 of the loculi empty) : 66
- Ovary with 2 or more ovules in each loculus : 67
- 66 Shrubs, often climbing ; ovary 3-locular, sometimes with 1 or 2 empty loculi ; styles 3, elongated ; fruit winged, indehiscent or separating into 2-3 cocci [78. Malpighiaceae](#)
- Herbs ; ovary 2-locular, without empty loculi ; styles 2, short ; fruit not winged, separating into 2 cocci [30. Molluginaceae](#)
- 67 Leaves palmately lobed or deeply divided, with stipules ; ovary beaked, the beak surmounted by a 5-branched style ; herbs [39. Geraniaceae](#)
- Leaves not lobed or divided ; ovary unbeaked : 68

KEY TO THE FAMILIES OF DICOTYLEDONS

68	Styles 3-5, free :	69
	Leaves alternate, sometimes fasciculate :	73
69	Leaves with stipules ; sepals entire ; ovules numerous in each locus :	70
	Style 1 or stigma sessile :	71
70	herbs or shrublets, sometimes aquatic	28. Elatinaceae
	Leaves without stipules ; sepals toothed or lobed at the apex ; ovules 2 in each locus ; annual herbs	84. Linaceae
71	Stamens as many as or fewer than the petals ; trees or shrubs, often climbing	100. Celastraceae
	Stamens twice as many as the petals :	72
72	Trees with flowers in short terminal panicles ; leaves with interpetiolar stipules ; ovary 2-locular with a 2-branched style ; seeds with a fibrous pectinate aril	83. Ctenolophonaceae
	Herbs or small shrublets with solitary axillary flowers ; leaves with free stipules or stipular spines ; ovary 4-5-locular with an unbranched style ; seeds without an aril	85. Zygophyllaceae
73	Ovary with 1 ovule in each fertile locus (sometimes 1 or 2 of the loculi empty) :	74
	Ovary with 2 or more ovules in each locus :	92
74	Flowers unisexual or polygamous :	75
	Flowers bisexual :	78
75	Leaves without stipules ; petals 4 ; shrubs with small flowers in narrow spikelike or raceme-like panicles	119. Sapindaceae
	Leaves with stipules ; petals 5-6 or sometimes reduced to 3 :	76
76	Calyx cupular, open in bud ; style-branches 3-4, entire ; fruit a drupe ; stamens twice as many as the petals ; trees	101. Pandaceae
	Calyx composed of 5 sepals or splitting into 2-5 valvate lobes ; styles or style- branches 2 or more, lobed or divided ; fruit a capsule ; stamens as many as the petals or more numerous ; trees or shrubs or herbs, sometimes climbing	86. Euphorbiaceae
78	Anthers 1-theous ; stamens numerous, the filaments more or less united into a tube ; sepals valvate, with or without an epicalyx of bracteoles ; herbs or shrublets, often with stellate hairs	77. Malvaceae
	Anthers 2-theous :	79
79	Leaves with stipules ; trees or shrubs :	80
	Leaves without stipules :	84
80	Petals and stamens perigynous, inserted at the mouth of the calyx-tube ; ovary lateral, inserted on one side of the calyx-tube ; style arising laterally from the base of the ovary	87. Rosaceae
	Petals and stamens hypogynous, not inserted on the calyx ; ovary central ; style or styles central or terminal on the ovary :	81
81	Ovary deeply lobed, with 1 style, the carpels separating in fruit ; stamens free, twice as many as the petals or more numerous	63. Ochnaceae
	Ovary entire, with 1 or 3 styles, the carpels not separating in fruit ; stamens free or the filaments united below :	82
82	Filaments united below into a tube or cup, twice as many as the petals ; styles or style-branches 3 ; ovary with 1 fertile locus and 2 empty loculi	81. Erythroxylaceae
	Filaments free ; style 1, unbranched ; ovary with 2-6 fertile loculi :	83
83	Shrubs with spiny branches ; leaves mostly fasciculate ; stipules not leaving annular scars round the nodes ; stamens twice as many as the petals or more numerous	85. Zygophyllaceae
	Trees without spines ; leaves not fasciculate ; stipules leaving annular scars round the nodes ; stamens twice as many as the petals	116. Irvingiaceae
84	Herbs ; sepals 4 ; petals 4 ; stamens 6 ; leaves (at least the basal ones) more or less pinnately divided	19. Cruciferae
	Trees or shrubs, sometimes climbing ; sepals 4-6 ; petals 4-10 ; stamens 8 or more ; leaves entire or crenulate :	85
85	Styles 2-5 :	87
	Style 1 :	88
87	Stamens numerous, united into 5 bundles opposite to the petals ; styles 5 ; fruit a berry, not winged	71. Hypericaceae
	Stamens twice as many as the petals, free ; styles 2-3 ; fruit winged	78. Malpighiaceae
88	Petals 8-10, twice as many as the sepals ; stamens as many as and alternating with the petals	46. Thymelaeaceae

KEY TO THE FAMILIES OF DICOTYLEDONS

Petals 4-6, as many as the sepals :	89
89 Petals valvate ; stamens twice as many as the petals or more numerous ; ovary 3-4-locular, sometimes incompletely septate at the top	<u>104. Olacaceae</u>
Petals imbricate ; stamens twice as many as the petals ; ovary 4-5- locular, completely septate :	90
90 Leaves dotted with pellucid glands ; petals glabrous, gland-dotted ; filaments equal	<u>114. Rutaceae</u>
Leaves without pellucid glands ; petals hairy outside, not gland-dotted ; filaments unequal	<u>79. Humiriaceae</u>
92 Stamens as many as or fewer than the petals :	93
Stamens more numerous than the petals :	101
93 Ovary 5-locular :	94
Ovary 2-4-locular :	96
94 Sepals valvate, surrounded by an epicalyx of 3 bracteoles ; stamens alternating with liguliform staminodes ; herbs or shrublets with stellate hairs.....	<u>75. Sterculiaceae</u>
Sepals imbricate, without an epicalyx ; stamens not accompanied by staminodes ; trees or shrubs :	95
95 Anthers opening by apical pores ; ovules numerous in each loculus ; seeds winged, without an aril.....	<u>63. Ochnaceae</u>
Anthers opening by longitudinal slits ; ovules 2 in each loculus ; seeds with an aril, not winged.....	<u>80. Ixonanthaceae</u>
96 Styles 2-3, free or united at the base, often lobed or branched ; flowers unisexual ; trees or shrubs	<u>86. Euphorbiaceae</u>
Style 1 or stigmas sessile ; flowers bisexual or unisexual :	97
97 Herbs ; sepals valvate ; fruit covered with hooked prickles	<u>74. Tiliaceae</u>
Trees or shrubs, sometimes climbing ; sepals imbricate ; fruit without hooked prickles :	98
98 Stamens 3, fewer than the petals ; ovules 2 or more in each loculus	<u>100. Celastraceae</u>
Stamens 4-5, as many as the petals ; ovules 2 in each loculus :	99
99 Ovules erect from the base of the loculi	<u>100. Celastraceae</u>
Ovules pendulous from the apex or near the apex of the loculi :	100
100 Style absent, the stigmas sessile ; flowers unisexual ; petals short and scale-like, entire ; fruit a capsule	<u>86. Euphorbiaceae</u>
Style present, elongated ; flowers bisexual or unisexual ; petals 2-lobed or sometimes entire ; fruit a drupe	<u>88. Chaillotiaceae</u>
101 Leaves without stipules ; trees or shrubs, sometimes climbing :	102
Leaves with stipules :	107
102 Ovules 2 in each loculus :	103
Ovules numerous in each loculus :	105
103 Filaments united into a tube ; petals imbricate ; fruit a capsule	<u>118. Meliaceae</u>
Filaments free or shortly united at the base ; petals valvate :	104
104 Stamens twice as many as the petals ; calyx 4-lobed ; fruit drupaceous ; flowers bisexual or unisexual	<u>117. Burseraceae</u>
Stamens numerous, more than twice as many as the petals ; calyx cupular ; fruit a capsule or drupe ; flowers bisexual	<u>73. Scytopetalaceae</u>
105 Leaves dotted with pellucid glands ; branches often armed with axillary spines.....	<u>114. Rutaceae</u>
Leaves without pellucid glands ; branches unarmed :	106
106 Petals valvate ; calyx cupular ; stamens numerous ; anthers opening by apical pore-like slits ; flowers bisexual	<u>73. Scytopetalaceae</u>
Petals imbricate, with thick scale-like bases ; calyx composed of 5 free sepals ; stamens 9-13 ; anthers opening by longitudinal slits ; flowers polygamous.....	<u>105. Pentadiplandraceae</u>
107 Sepals imbricate ; ovules 2 in each loculus ; trees or shrubs, sometimes climbing :	108
Sepals or calyx-lobes valvate, sometimes with an epicalyx of bracteoles ; ovules 2 or more in each loculus :	111
108 Flowers unisexual, in short sessile catkin-like racemes or fascicles ; petals imbricate ; petioles jointed at the top	<u>82. Lepidobotryaceae</u>
Flowers bisexual ; petals contorted ; petioles not jointed :	109
109 Stamens numerous, more than twice as many as the petals ; fruit indehiscent, surrounded by the 5 persistent accrescent wing-like sepals	<u>65. Dipterocarpaceae</u>
Stamens twice as many as the petals ; fruit not surrounded by persistent wing-like sepals :	110

KEY TO THE FAMILIES OF DICOTYLEDONS

- 110** Styles 3-5 ; petals fugacious ; fruit a drupe ; branches often armed with hooked spines [84. Linaceae](#)
 Style 1 ; petals persistent ; fruit a septicidal capsule ; branches unarmed [80. Ixonanthaceae](#)
- 111** Anthers 1-theous ; filaments united into a tube surrounding the ovary ; calyx with or without an epicalyx ; trees or shrubs or herbs [77. Malvaceae](#)
 Anthers 2-theous : **112**
- 112** Stamens all fertile, not accompanied by staminodes, free or the filaments united below into a short tube or into bundles opposite to the petals ; trees or shrubs or herbs [74. Tiliaceae](#)
 Stamens accompanied by staminodes : **113**
- 113** Stamines petaloid or liguliform or filiform, inserted inside or in the same whorl as the stamens and often united with them to form a tube or cup ; stamens often grouped into bundles of 2-4 alternating with the staminodes ; trees or shrubs [75. Sterculiaceae](#)
 Stamines filiform, inserted outside the stamens and free from them ; stamens not grouped into bundles ; herbs or shrubs [74. Tiliaceae](#)

Group 11

- 1** Ovary 1-locular, sometimes septate towards the base : **2**
 Ovary 2- or more-locular, completely or almost completely septate or the loculi free : **12**
- 2** Leaves peltate or subpeltate ; flowers dioecious, the males with united petals, the females with 1-3 free petals ; stamens united into a synandrium ; woody climbers [12. Menispermaceae](#)
 Leaves not peltate ; flowers bisexual or sometimes dioecious, all with united petals ; stamens free or with united filaments : **3**
- 3** Ovary with 1 ovule : **4**
 Ovary with 2 or more ovules : **6**
- 4** Stamens twice as many as the calyx-lobes, inserted on the elongated calyx-tube ; corolla ring-like, inserted at the mouth of the calyx-tube ; ovule pendulous from the apex of the ovary ; shrubs [46. Thymelaeaceae](#)
 Stamens as many as the calyx-lobes, not inserted on the calyx ; corolla 4-5-lobed ; ovule arising from the base of the ovary : **5**
- 5** Leaves alternate ; stamens opposite to the corolla-lobes ; calyx covered outside with stalked glands ; climbing shrubs [143. Plumbaginaceae](#)
 Leaves opposite ; stamens alternating with the corolla-lobes ; calyx without stalked glands ; trees or shrubs [103. Salvadoraceae](#)
- 6** Stamens fewer than the corolla-lobes ; flowers more or less zygomorphic : **7**
 Stamens as many as the corolla-lobes ; flowers actinomorphic or slightly zygomorphic : **9**
- 7** Ovules 2 ; calyx enclosed by 2 opposite ovate bracteoles ; climbing plants with opposite leaves ; stamens 4 [159. Acanthaceae](#)
 Ovules numerous ; calyx not enclosed by bracteoles ; herbs, often aquatic or sub-aquatic or sometimes epiphytic : **8**
- 8** Stamens 2 ; corolla-tube spurred ; leaves undivided or much divided and often bearing insectivorous bladders [155. Lentibulariaceae](#)
 Stamens 4 ; corolla-tube not spurred ; leaves undivided, without bladders [153. Scrophulariaceae](#)
- 9** Stamens opposite to the corolla-lobes : **10**
 Stamens alternating with the corolla-lobes : **11**
- 10** Trees or shrublets ; fruit a berry ; flowers in fascicles of 3 or more [130. Myrsinaceae](#)
 Herbs ; fruit a capsule ; flowers solitary or in fascicles of 2-3 [142. Primulaceae](#)
- 11** Ovules 4, pendulous from the apex of a 4-winged free-basal placenta ; fruit a compressed 2-valved capsule ; flowers bisexual ; corolla-lobes and stamens 4 ; leaves opposite ; littoral trees or shrubs [161. Avicenniaceae](#)
 Ovules 2, pendulous from the apex of the ovary ; fruit a drupe ; flowers bisexual or unisexual ; corolla-lobes and stamens 3-5 ; leaves alternate or opposite ; trees or shrubs, sometimes climbing [102. Icacinaceae](#)
- 12** Corolla-lobes numerous ; trees or shrubs, sometimes climbing or epiphytic : **13**
 Corolla-lobes fewer than 12 : **15**
- 13** Leaves opposite ; corolla-lobes contorted ; stamens as many as the corolla-lobes, the filaments united below into a tube or cup ; ovary with numerous ovules in each loculus [132. Loganiaceae](#)
 Leaves alternate ; corolla-lobes imbricate or valvate : **14**

KEY TO THE FAMILIES OF DICOTYLEDONS

- 14 Ovary with numerous ovules in each loculus ; corolla-lobes in 1 series, much shorter than the broad-campanulate many-ribbed tube ; stamens numerous, not accompanied by staminodes ; branches with foliaceous wings [67. Lecythidaceae](#)
 Ovary with 1 ovule in each loculus ; corolla-lobes imbricate in 2 or more series, as long as or longer than the tube ; stamens as many as and opposite to the inner corolla-lobes and alternating with staminodes ; branches not winged [129. Sapotaceae](#)
- 15 Stamens more numerous than the corolla-lobes : **16**
 Stamens as many as or fewer than the corolla-lobes : **22**
- 16 Leaves with stipules ; trees or shrubs or herbs, sometimes climbing : **17**
 Leaves without stipules : **18**
- 17 Flowers bisexual ; anthers 1-theous ; filaments united into a tube surrounding the ovary ; leaves simple, sometimes palmately lobed or divided [77. Malvaceae](#)
 Flowers unisexual ; anthers 2-theous ; filaments free or some or all united ; leaves simple (often palmately lobed) or digitate [86. Euphorbiaceae](#)
- 18 Flowers zygomorphic, the lowest (abaxial) corolla-lobe forming a carina bearing 1.00 stamens and enclosing the ovary ; herbs or shrublets ; ovary 2-locular with 1 ovule in each loculus [22. Polygalaceae](#)
 Flowers actinomorphic, the corolla not forming a carina ; trees or shrubs : **19**
- 19 Anthers opening by apical pores or pore-like slits ; ovary with more than 2 ovules in each loculus ; leaves alternate or opposite or verticillate, sometimes small and heath-like [126. Ericaceae](#)
 Anthers opening by longitudinal slits ; ovary with 1-2 ovules in each loculus ; leaves alternate : **20**
- 20 Leaves pinnate or 1-3-foliolate ; flowers bisexual ; corolla-lobes valvate ; stamens twice as many as the corolla-lobes, united into a tube [118. Meliaceae](#)
 Leaves simple ; flowers unisexual or sometimes bisexual ; corolla-lobes imbricate or contorted ; stamens free or the filaments united in pairs or at the base : **21**
- 21 Corolla-lobes imbricate ; stamens arranged in groups opposite to the corolla-lobes and alternating with staminodes ; style 1, unbranched [129. Sapotaceae](#)
 Corolla-lobes contorted ; stamens sometimes paired but not arranged in groups alternating with staminodes ; styles (or style-branches) 2-5 [127. Ebenaceae](#)
- 22 Stamens fewer than the corolla-lobes : **23**
 Stamens as many as the corolla-lobes : **35**
- 23 Ovary with numerous (more than 4) ovules in each loculus : **24**
 Ovary with 1-4 ovules in each loculus : **29**
- 24 Leaves pinnate ; stamens 4 ; fruit a loculicidal capsule with winged seeds ; trees or shrubs [157. Bignoniaceae](#)
 Leaves simple or digitate, sometimes deeply divided or reduced to scales : **25**
- 25 Stamen 1 ; climbing shrubs with opposite entire leaves ; fruit a septicidal capsule with winged seeds [132. Loganiaceae](#)
 Stamens 2-4 : **26**
- 26 Ovary completely or incompletely 4-chambered, each of the 2 original loculi becoming divided into 2 by a false septum ; flowers solitary or cymose in the axils of the leaves ; stamens 4 ; herbs [158. Pedaliaceae](#)
 Ovary 2-locular, the loculi not divided by false septa : **27**
- 27 Ovules arranged in 1-2 series on each placenta ; fruit a loculicidal capsule, the seeds often borne on hardened hook-like funicles (retinacula) ; leaves opposite or sometimes alternate ; herbs or shrublets.. [159. Acanthaceae](#)
 Ovules arranged in more than 2 series on each placenta ; fruit a septicidal or loculicidal capsule, the seeds not borne on hardened hook-like funicles : **28**
- 28 Corolla-lobes very short, alternating with claviform processes ; stamens 2 ; leaves alternate ; herbs [151. Solanaceae](#)
 Corolla-lobes not alternating with claviform processes ; stamens 2-4 ; leaves alternate or opposite or verticillate, sometimes reduced to scales ; herbs or shrublets, sometimes aquatic or parasitic on roots [153. Scrophulariaceae](#)
- 29 Peduncles adnate to the petioles of the subtending leaves ; leaves alternate, simple, with stipules ; stamens 2-3 ; trees [88. Chailletiaceae](#)
 Peduncles free from the leaves ; leaves without stipules : **30**
- 30 Perianth actinomorphic ; stamens 2 ; leaves simple or 3-foliolate, opposite or sometimes ternate ; trees or shrubs, sometimes climbing [133. Oleaceae](#)
 Perianth zygomorphic : **31**
- 31 Ovary more or less deeply 4-lobed, the style gynobasic ; fruit separating into 4 nutlets (or fewer by abortion) ;

KEY TO THE FAMILIES OF DICOTYLEDONS

- leaves simple, opposite or verticillate or sometimes alternate ; herbs or shrubs, often aromatic [162. Labiatae](#)
- Ovary not deeply 4-lobed, the style not gynobasic : **32**
- 32** Fruit a loculicidal capsule, the seeds often borne on hardened hook-like funicles (retinacula) ; leaves simple, opposite ; herbs or shrubs, sometimes climbing [159. Acanthaceae](#)
- Fruit indehiscent or separating into 2-4 pyrenes or cocci, the seeds not borne on hardened hook-like funicles : **33**
- 33** Flowers solitary, axillary ; fruit indehiscent, armed with 4 lateral spines ; stamens 4 ; leaves simple, opposite ; herbs [158. Pedaliaceae](#)
- Flowers grouped in inflorescences ; fruit drupaceous or separating into 2-4 pyrenes or cocci, without spines ; stamens 4 or 2 ; leaves simple or digitate, opposite or verticillate ; herbs or shrubs or trees, sometimes climbing [160. Verbenaceae](#)
- 35** Leaves absent or reduced to scales : **36**
- Leaves present, well developed, sometimes appearing after the flowers : **37**
- 36** Slender twining parasitic herbs ; corolla-tube with a series of fimbriate scales below and opposite to the stamens ; ovary with 2 ovules in each loculus ; fruit a capsule [152. Convolvulaceae](#)
- Shrubs (sometimes climbing) or succulent plants, not parasitic ; corolla-tube with a 1-2-seriate corona above the stamens or adnate to the outside of the united filaments ; ovary with numerous ovules in each loculus ; fruit formed of 2 separated follicular carpels (or 1 by abortion) [136. Asclepiadaceae](#)
- 37** Leaves opposite or verticillate, not all radical : **38**
- Leaves alternate, sometimes all radical : **53**
- 38** Stamens hypogynous, not inserted on the corolla, the anthers opening by apical pore-like slits ; heath-like shrubs with small verticillate leaves [126. Ericaceae](#)
- Stamens inserted on the corolla-tube ; plants not heath-like : **39**
- 39** Ovary with 1-2 ovules in each loculus : **40**
- Ovary with 3 or more ovules in each loculus : **45**
- 40** Style 2-branched, the branches again 2-branched ; trees or shrubs : **41**
- Style unbranched or with 2 simple branches : **42**
- 41** Calyx-lobes longer than the tube ; ovary 2-locular with 2 ovules in each loculus ; fruit a compressed 2-lobed loculicidal capsule [132. Loganiaceae](#)
- Calyx-lobes shorter than the tube ; ovary 4-locular with 1 ovule in each loculus ; fruit a drupe [150. Boraginaceae](#)
- 42** Corolla-lobes valvate ; leaves with interpetiolar stipules ; trees or shrubs [137. Rubiaceae](#)
- Corolla-lobes imbricate or contorted ; leaves without stipules : **43**
- 43** Corolla-lobes 4, imbricate ; herbs or shrubs or trees, sometimes climbing [160. Verbenaceae](#)
- Corolla-lobes 5, contorted : **44**
- 44** Herbs, often hispid with bulbous-based hairs ; anthers hairy, connivent into a twisted cone protruding from the corolla-tube ; ovary 4-locular [150. Boraginaceae](#)
- Trees or shrubs ; anthers glabrous, included in the corolla-tube, not connivent into a twisted cone [134. Apocynaceae](#)
- 45** Ovary-loculi free or almost free, connected above by the style ; fruit formed of 2 or more separated carpels (or 1 by abortion) : **46**
- Ovary-loculi completely united ; fruit a capsule or berry : **48**
- 46** Pollen granular, liberated freely, without pollen-carriers ; corolla-tube without a corona or sometimes with scales or appendages at the mouth or above the stamens ; fruiting carpels follicular or baccate ; seeds with or without hairs, sometimes arillate ; trees or shrubs, sometimes climbing [134. Apocynaceae](#)
- Pollen granular or waxy, transported by 5 pollen carriers at first resting on the style ; corolla-tube with a 1-2-seriate corona above the stamens or adnate to the outside of the filaments ; fruiting carpels follicular ; seeds with an apical tuft of silky hairs ; herbs or shrubs, often climbing : **47**
- 47** Pollen agglutinated into waxy masses (pollinia) attached in pairs or fours to the pollen-carriers ; filaments united into a tube or ring [136. Asclepiadaceae](#)
- Pollen granular, in tetrads, transported on glandular spatulate carriers ; filaments free [135. Periplocaceae](#)
- 48** Corolla-lobes valvate ; trees or shrubs or herbs, sometimes climbing, the branches often bearing spines or hooked tendrils [132. Loganiaceae](#)
- Corolla-lobes imbricate or contorted : **49**
- 49** Corolla-lobes imbricate : **50**
- Corolla-lobes contorted : **51**

KEY TO THE FAMILIES OF DICOTYLEDONS

- 50 Herbs ; flowers solitary or paired in the axils of the leaves [153. Scrophulariaceae](#)
 Trees or shrubs ; flowers in cymes or cymose panicles [132. Loganiaceae](#)
- 51 Herbs ; fruit a septicidal capsule [140. Gentianaceae](#)
 Trees or shrubs, sometimes climbing or epiphytic ; fruit a berry : **52**
- 52 Corolla-lobes and stamens 6–11; filaments united below into a tube or cup [132. Loganiaceae](#)
 Corolla-lobes and stamens 5 ; filaments free [134. Apocynaceae](#)
- 53 Leaves all radical ; corolla-lobes and stamens 4 ; fruit a circumscissile capsule ; scapigerous herbs with small flowers in spikes [144. Plantaginaceae](#)
 Leaves not all radical : **54**
- 54 Ovary with numerous ovules in each loculus : **55**
 Ovary with 1-2 ovules in each loculus : **60**
- 55 Corolla-lobes contorted ; fruit formed of 2 separated follicular carpels (or 1 by abortion) ; shrubs [134. Apocynaceae](#)
 Corolla-lobes imbricate or valvate or plicate ; fruit a capsule or berry : **56**
- 56 Styles 2 ; corolla-lobes imbricate ; fruit a capsule ; herbs [149. Hydrophyllaceae](#)
 Style 1 : **57**
- 57 Corolla-lobes plicate or valvate ; herbs or shrubs or trees, sometimes climbing [151. Solanaceae](#)
 Corolla-lobes imbricate : **58**
- 58 Flowers subsessile in long scorpioid cymes ; fruit a circumscissile capsule enclosed in the persistent accrescent calyx ; herbs [151. Solanaceae](#)
 Flowers solitary or paired in the axils of the leaves, pedicellate ; fruit not circumscissile : **59**
- 59 Spiny shrubs ; fruit a berry [151. Solanaceae](#)
 Herbs or shrublets, not spiny ; fruit a capsule [153. Scrophulariaceae](#)
- 60 Petals united below into a sheath open on the upper (adaxial) side and bearing the stamens, the filaments also united below into a sheath ; flowers zygomorphic ; trees or shrubs, sometimes climbing [22. Polygalaceae](#)
 Petals united at least at the base into a tube ; flowers actinomorphic or slightly zygomorphic : **61**
- 61 Stamens opposite to the corolla-lobes ; fruit a berry ; trees or shrubs : **62**
 Stamens alternating with the corolla-lobes : **63**
- 62 Leaves 2-3-pinnate ; corolla-lobes valvate ; filaments united into a lobed tube [113. Ampelidaceae](#)
 Leaves simple ; corolla-lobes imbricate ; filaments free, sometimes alternating with staminodes [129. Sapotaceae](#)
- 63 Flowers unisexual ; style absent, the stigma sessile ; trees [99. Aquifoliaceae](#)
 Flowers bisexual ; styles 1–2, sometimes branched : **64**
- 64 Ovules pendulous from the apex of the loculi ; leaves with stipules ; trees or shrubs, sometimes climbing **88. Chaillotiaceae**
 Ovules erect from the base of the loculi ; leaves without stipules : **65**
- 65 Styles 2, free, sometimes 2-branched : **66**
 Style 1, sometimes with 2 or 4 branches : **67**
- 66 Corolla-lobes and stamens 4 ; leaves toothed or pinnately lobed ; annual herbs **150. Boraginaceae**
 Corolla-lobes and stamens 5 ; leaves entire ; herbs or shrubs, sometimes climbing **152. Convolvulaceae**
- 67 Fruit separating into 2-4 nutlets ; style terminal or gynobasic ; herbs or shrublets **150. Boraginaceae**
 Fruit not separating into nutlets ; style terminal : **68**
- 68 Corolla-lobes imbricate; sepals united at least at the base ; fruit drupaceous ; trees or shrubs .. **150. Boraginaceae**
 Corolla-lobes plicate or valvate ; sepals free ; fruit a capsule or sometimes indehiscent ; herbs or shrubs, often trailing or climbing [152. Convolvulaceae](#)

Group 12

- 1 Ovary 1- or more-locular with 2 or more ovules in each loculus : **2**
 Ovary 1- or more-locular with 1 ovule in each loculus : **24**
- 2 Plants aquatic, moss-like or liverwort-like in habit, growing on rocks ; flowers small and inconspicuous, with 1–2 stamens ; ovary with numerous ovules ; fruit a capsule [27. Podostemaceae](#)

KEY TO THE FAMILIES OF DICOTYLEDONS

	Plants terrestrial or sometimes aquatic but not moss-like or liverwort-like in habit :	3
3	Leaves compound ; trees or shrubs with unisexual or polygamous flowers ; ovary or more-locular :	4
	Leaves simple, sometimes lobed :	6
4	Leaves pinnate ; ovary with 2 ovules in each loculus.....	<u>119. Sapindaceae</u>
	Leaves digitate :	5
5	Leaves alternate ; stamens united into a column ; ovules numerous (more than 2) in each loculus ; fruit formed of 3 or more separated follicular carpels (or fewer by abortion).....	<u>75. Sterculiaceae</u>
	Leaves opposite ; stamens free ; ovules 2 in each loculus ; fruit a woody loculicidal capsule ..	<u>86. Euphorbiaceae</u>
6	Leaves all or some opposite or verticillate, sometimes all radical :	7
	Leaves alternate, not all radical :	13
7	Flowers unisexual ; woody plants :	8
	Flowers bisexual ; herbs, sometimes aquatic :	9
8	Climbing shrubs with tendrils ; perianth-segments valvate ; stamens as many as and alternating with the perianth-segments ; ovary 1-locular with 2 pendulous apical ovules.....	<u>102. Icacinaceae</u>
	Shrubs or trees without tendrils ; perianth-segments imbricate ; stamens 6, 2 opposite to the outer perianth-segments, 4 in pairs opposite to the inner perianth- segments ; ovary 3-locular with 2 ovules in each loculus	<u>92. Buxaceae</u>
9	Style 1 :	10
	Styles 2-5 :	11
10	Leaves with stipules ; sepals free ; stamens hypogynous ; style with 3 stigmatic branches ...	<u>29. Caryophyllaceae</u>
	Leaves without stipules ; sepals united into a tube ; stamens or single stamen perigynous, inserted on the calyx-tube ; style unbranched.....	<u>42. Lythraceae</u>
11	Ovary 1-locular with a free-basal or free-central placenta ; leaves without stipules	<u>29. Caryophyllaceae</u>
	Ovary 2-5-locular with axile placentas ; leaves with or without stipules :	12
12	Sepals united below ; stamens perigynous, inserted on the calyx-tube ; fruit a circumscissile capsule	<u>31. Ficoidaceae</u>
	Sepals free ; stamens hypogynous or subhypogynous ; fruit a loculicidal capsule	<u>30. Molluginaceae</u>
13	Ovary 1-locular :	14
	Ovary 2- or more-locular :	17
14	Stamens numerous (more than 10) ; style arising from the base of the ovary ; flowers polygamous, in panicles ; trees	<u>87. Rosaceae</u>
	Stamens 3-8 ; style or sessile stigma terminal or lateral, not arising from the base of the ovary ; flowers in racemes or spikes or fascicles :	15
15	Herbs, sometimes climbing ; flowers bisexual ; fruit a circumscissile capsule	<u>37. Amaranthaceae</u>
	Trees or shrubs, sometimes climbing ; flowers unisexual ; fruit indehiscent, often drupaceous :	16
16	Leaves with stipules ; perianth-segments imbricate ; stamens as many as and opposite to the perianth-segments or more numerous.....	<u>86. Euphorbiaceae</u>
	Leaves without stipules ; perianth-segments valvate ; stamens as many as and alternating with the perianth-segments.....	<u>102. Icacinaceae</u>
17	Flowers bisexual :	18
	Flowers unisexual or polygamous :	19
18	Ovary borne on an elongated gynophore ; stamens numerous (more than 10) ; fruit indehiscent, unwinged ; flowers solitary, axillary, pedunculate ; shrubs or herbs.....	<u>17. Cappariaceae</u>
	Ovary sessile or subsessile ; stamens 5-8 ; fruit a septeidal capsule with 2 or more longitudinal membranous wings ; flowers in panicles or racemes ; shrubs or trees.....	<u>119. Sapindaceae</u>
19	Filaments completely united into a column :	20
	Filaments all or some free at least above :	21
20	Calyx-segments valvate ; anthers 5 or more ; fruit formed of 3 or more separated follicular or indehiscent carpels (or fewer by abortion) ; trees or shrubs	<u>75. Sterculiaceae</u>
	Calyx-segments imbricate ; anthers 2-3 ; fruit a capsule ; herbs or shrubs.....	<u>86. Euphorbiaceae</u>
21	Stamens 10 or more ; trees or shrubs :	22
	Stamens fewer than 10 :	23

KEY TO THE FAMILIES OF DICOTYLEDONS

- 22 Stigmas terminating 2 or more styles ; branches often armed with axillary spines [53. Flacourtiaceae](#)
 Stigmas sessile or subsessile, 2 or more, entire or 2-lobed ; branches without spines [86. Euphorbiaceae](#)
- 23 Leaves with stipules or stipular spines ; styles 2-4, free or united below, or stigmas sessile ; fruit an unwinged capsule or indehiscent or separating into 2 winged cocci ; trees or shrubs or herbs, sometimes climbing [86. Euphorbiaceae](#)
 Leaves without stipules ; style 1 ; fruit a septieidal capsule with 2 or more longitudinal membranous wings ; shrubs or trees [119. Sapindaceae](#)
- 24 Ovary 2- or more-locular : 25
 Ovary 1-locular : 34
- 25 Flowers bisexual : 26
 Flowers unisexual or polygamous, sometimes grouped in involucre inflorescences simulating bisexual or male flowers : 27
- 26 Trees or shrubs ; sepals united into a tube ; stamens twice as many as the calyx-lobes, perigynous, inserted on the calyx-tube ; fruit a drupe [46. Thymelaeaceae](#)
 Herbs ; sepals free ; stamens hypogynous or subhypogynous ; fruit separating into 2 cocci sometimes winged along the back [30. Molluginaceae](#)
- 27 Male flowers reduced to a single stamen with or without a minute vestigial calyx : 28
 Male flowers with 2 or more stamens and with a calyx of 2 or more free or united sepals : 29
- 28 Flowers solitary or paired in the axils of the leaves ; ovary 4-locular ; leaves opposite ; aquatic or subaquatic herbs [45. Haloragaceae](#)
 Flowers grouped in involucre inflorescences, the involucre either cupular or composed of free bracts and containing a number of male flowers with or without a female flower ; ovary 2-4-locular ; leaves alternate or opposite, sometimes reduced to scales or stipular spines ; terrestrial herbs or shrubs or trees, sometimes succulent [86. Euphorbiaceae](#)
- 29 Leaves pinnate ; trees or shrubs [119. Sapindaceae](#)
 Leaves simple or digitately 3-foliolate : 30
- 30 Filaments completely united into a column bearing 8-20 anthers ; trees with simple or 3-foliolate leaves [86. Euphorbiaceae](#)
 Filaments all or some free at least above ; leaves simple, sometimes lobed or deeply divided : 31
- 31 Stamens 2-5 ; trees or shrubs or herbs, sometimes climbing [86. Euphorbiaceae](#)
 Stamens 6 or more : 32
- 32 Branches armed with axillary spines ; fruit a berry ; shrubs or trees [53. Flacourtiaceae](#)
 Branches without spines : 33
- 33 Leaves with stipules ; ovary 2-4-locular ; styles or stigmas 1-4, often branched or lobed ; fruit a capsule, sometimes tardily dehiscent or indehiscent ; trees or shrubs or herbs, sometimes climbing .. [86. Euphorbiaceae](#)
 Leaves without stipules ; ovary 5-7-locular ; styles 5-7, not branched or lobed ; fruit a berry ; climbing shrubs with flowers in elongated racemes [35. Phytolaccaceae](#)
- 34 Leaves absent or reduced to scales ; flowers spicate : 35
 Leaves present, not reduced to scales : 36
- 35 Slender twining parasitic plants ; flowers not immersed in the rachis of the spike ; stamens 6-9, accompanied by staminodes ; anthers opening by upcurving valves [6. Lauraceae](#)
 Succulent salt-marsh herbs with articulated branches, not parasitic ; flowers immersed in the rachis of the spike ; stamens 1-2 ; anthers opening by longitudinal slits [36. Chenopodiaceae](#)
- 36 Leaves with stipules or with a sheathing or annular base surrounding the stem : 37
 Leaves without stipules, the base not sheathing or surrounding the stem : 49
- 37 Leaves 1-4-pinnate or 2-foliolate : 38
 Leaves simple or digitate with 3 or more leaflets : 39
- 38 Herbs ; leaves 2-4-pinnate ; fruit a small stipitate achene, not winged [9. Ranunculaceae](#)
 Trees ; leaves 1-pinnate or 2-foliolate ; fruit large, sessile or stipitate, woody or winged [89. Caesalpiniaceae](#)
- 39 Ovule pendulous from the apex or near the apex of the ovary ; flowers unisexual or polygamous : 40
 Ovule arising from the base or near the base of the ovary : 43
- 40 Leaves all or mostly digitate ; male flowers in elongated panicles, female flowers spicate and enclosed by bracts ; annual herbs [98. Cannabinaceae](#)
 Leaves simple : 41

KEY TO THE FAMILIES OF DICOTYLEDONS

- 41 Flowers densely spicate or capitate, or arranged on or in a flat or cupular receptacle or inside a hollow almost closed receptacle (fig), the females sometimes solitary on a bracteate receptacle or sometimes immersed in the tissue of the receptacle ; perianth present or absent ; trees or shrubs or herbs, sometimes epiphytic [96. Moraceae](#)
 Flowers solitary or fasciculate or in cymes or racemes or panicles ; perianth present ; trees or shrubs : 42
- 42 Style 2-branched with simple or divided stigmas ; fruit a drupe or a membranous-winged samara.. [95. Ulmaceae](#)
 Style short, unbranched ; fruit a capsule or indehiscent, not winged [86. Euphorbiaceae](#)
- 43 Leaves opposite : 44
 Leaves alternate : 45
- 44 Flowers unisexual ; stamens as many as and opposite to the calyx-segments or reduced to 1 ; leaves marked with cystoliths ; herbs or shrubs [97. Urticaceae](#)
 Flowers bisexual ; stamens as many as and alternating with the calyx-segments ; leaves small, fleshy, not marked with cystoliths ; herbs..... [31. Ficoidaceae](#)
- 45 Perianth absent ; flowers minute, in dense spikes ; shrubs, sometimes climbing [14. Piperaceae](#)
 Perianth present, sometimes vestigial in female flowers : 46
- 46 Styles or style-branches 2–3 ; stamens 5 or more ; leaves often with a basal sheath (ocrea) or annulus surrounding the stem ; herbs or shrubs or trees, sometimes climbing or aquatic [33. Polygonaceae](#)
 Style 1, unbranched, or stigma sessile ; stamens 1–8 : 47
- 47 Flowers bisexual, in spike-like racemes ; stamens as many as and alternating with the calyx-segments or more numerous ; herbs or shrublets..... [35. Phytolaccaceae](#)
 Flowers unisexual ; stamens as many as and opposite to the calyx-segments or reduced to 1 : 48
- 48 Stamens or single stamen erect in bud ; flowers dioecious, the males densely crowded in panicle spikes or heads, the females in pedunculate heads ; leaves simple or digitately compound ; trees or shrubs [96. Moraceae](#)
 Stamens inflexed in bud ; flowers monoecious or dioecious, cymose, the cymes often dense or head-like and sometimes enclosed in an involucre ; leaves simple, sometimes pinnately lobed or palmately 3-lobed, often marked with cystoliths ; herbs or shrubs, sometimes climbing or epiphytic [97. Urticaceae](#)
- 49 Submerged aquatic herbs ; leaves verticillate, deeply dichotomously divided into linear or filiform segments ; flowers unisexual, solitary and sessile in the axils of the leaves [10. Ceratophyllaceae](#)
 Plants terrestrial ; leaves alternate or opposite or verticillate, sometimes pinnately lobed but not dichotomously divided : 50
- 50 Perianth absent ; flowers in spikes : 51
 Perianth present : 52
- 51 Trees ; flowers unisexual ; stamens 3–12 ; styles 2, free or shortly united below ; leaves alternate, mostly toothed [94. Myricaceae](#)
 Herbs, sometimes climbing or epiphytic ; flowers bisexual; stamens 2 ; style absent, the stigma sessile ; leaves alternate or opposite or verticillate, entire [14. Piperaceae](#)
- 52 Stamens united into a column ; seed arillate ; flowers dioecious, in small solitary or clustered (sometimes paniculate) umbels or heads ; trees or climbing shrubs [8. Myristicaceae](#)
 Stamens free or the filaments united at the base into a cup ; seed not arillate : 53
- 53 Anthers opening by upcurving valves ; calyx with 6–8 lobes in 2 series ; stamens 6–12 in 2-3 series, accompanied on the inside by staminodes ; trees or shrubs [6. Lauraceae](#)
 Anthers opening by longitudinal slits ; calyx with 3-6 segments or lobes in 1 series : 54
- 54 Stamens more numerous than the calyx-segments or -lobes : 55
 Stamens as many as or fewer than the calyx-segments or -lobes, sometimes alternating with staminodes : 57
- 55 Ovule arising from the base of the ovary ; stamens fewer than twice as many as the calyx-lobes ; calyx tubular, petaloid, the lower portion persistent round the fruit and often bearing glands on the outside ; herbs or shrubs, sometimes climbing..... [47. Nyctaginaceae](#)
 Ovule pendulous from the apex of the ovary ; stamens twice as many as the calyx-segments or -lobes or more numerous : 56
- 56 Flowers bisexual ; sepals united into an elongated tube ; stamens inserted on the calyx-tube ; leaves alternate or opposite ; shrubs or herbs, sometimes climbing [46. Thymelaeaceae](#)
 Flowers unisexual ; sepals shortly united at the base ; stamens not inserted on the calyx ; leaves opposite or subopposite ; shrubs or trees [5. Monimiaceae](#)
- 57 Leaves opposite : 58
 Leaves alternate : 59
- 58 Calyx petaloid, the sepals united into a tube constricted above the ovary, the lower portion persistent round the

KEY TO THE FAMILIES OF DICOTYLEDONS

- fruit and often bearing glands on the outside ; stamens not accompanied by staminodes ; herbs, sometimes climbing [47. Nyctaginaceae](#)
- Calyx dry and scarious, the sepals free or shortly united at the base, not forming a tube constricted above the ovary ; stamens often alternating with staminodes ; herbs or shrubs, sometimes climbing ... [37. Amaranthaceae](#)
- 59** Calyx with 3-4 valvate segments or lobes : **60**
- Calyx with 3-5 imbricate segments or lobes : **61**
- 60** Trees or shrubs ; flowers bisexual, in large bracteate heads or in elongated spikes; stamens inserted on the calyx-segments [48. Proteaceae](#)
- Herbs, sometimes climbing ; flowers unisexual or polygamous, in small dense or lax cymes in the axils of the leaves ; stamens not inserted on the calyx [97. Urticaceae](#)
- 61** Stamens 4, as many as and alternating with the calyx-segments ; calyx zygomorphic; herbs with flowers in racemes [35. Phytolaccaceae](#)
- Stamens 1-5, as many as and opposite to the calyx-segments or -lobes or fewer ; calyx actinomorphic : **62**
- 62** Sepals united below into a tube with 2 adnate bracteoles outside ; twining herbs with flowers in axillary pedunculate spikes [38. Basellaceae](#)
- Sepals free or shortly united below, without adnate bracteoles ; herbs or shrubs, not twining : **63**
- 63** Calyx dry and more or less searious ; stamens sometimes alternating with staminodes ; leaves entire [37. Amaranthaceae](#)
- Calyx herbaceous ; stamens not accompanied by staminodes ; leaves entire or toothed or pinnately lobed [36. Chenopodiaceae](#)

Group 13

- 1** Parasitic shrubs growing on branches of other shrubs or trees ; ovule scarcely distinguishable from the surrounding tissue of the ovary ; calyx truncate or shortly lobed ; stamens as many as and inserted on the petals ; leaves simple, entire [109. Loranthaceae](#)
- Plants not parasitic ; ovule or ovules clearly distinguishable within the ovary : **2**
- 2** Ovary 1-locular : **3**
- Ovary 2- or more-locular, septate up to or almost up to the apex : **11**
- 3** Ovule 1 : **4**
- Ovules 2 or more : **7**
- 4** Leaves digitate with 3-5 leaflets ; anthers opening by upcurving valves ; stamens as many as the petals ; fruit with 2-4 broad lateral wings ; climbing shrubs [7. Hernandiaceae](#)
- Leaves simple, sometimes palmately lobed ; anthers or single anther opening by longitudinal slits : **5**
- 5** Leaves opposite ; flowers zygomorphic, the median (adaxial) sepal with 2 superposed spurs ; stamen 1 ; fruit indehiscent, crowned by the persistent accrescent sepals, 2 much larger than the others and wing-like ; trees [23. Vochysiaceae](#)
- Leaves alternate ; flowers actinomorphic ; stamens as many as or more numerous than the petals : **6**
- 6** Petals contorted ; fruit indehiscent, crowned by the persistent accrescent winglike sepals ; leaves equal-sided ; climbing shrubs with hooked spines [64. Ancistrocladaceae](#)
- Petals valvate ; fruit a drupe, not crowned by accrescent wing-like sepals ; leaves often unequal-sided; trees without spines [123. Alangiaceae](#)
- 7** Style 1, unbranched ; trees or shrubs, sometimes climbing : **8**
- Styles or style-branches 2-6 ; herbs or shrublets : **9**
- 8** Ovules pendulous from the apex or near the apex of the ovary ; fruit indehiscent, often with 2-6 longitudinal wings or angles ; flowers in racemes or spikes or heads ; leaves opposite or verticillate or alternate [69. Combretaceae](#)
- Ovules borne on a free-basal or free-central placenta ; fruit a berry, not winged or angled ; flowers in lax or dense cymes or fascicles or umbels, sometimes paniculate ; leaves opposite [68. Melastomataceae](#)
- 9** Ovules numerous on 1 or more free-basal placentas ; sepals 2, often deciduous ; fruit a circumscissile capsule [32. Portulacaceae](#)
- Ovules pendulous from the apex of the ovary or on pendulous apical placentas ; sepals or calyx-lobes 4-5 ; fruit not circumscissile : **10**
- 10** Ovules numerous on 2-3 pendulous placentas ; flowers bisexual, in axillary pairs ; petals and stamens 5 ; leaves opposite [25. Saxifragaceae](#)

KEY TO THE FAMILIES OF DICOTYLEDONS

- Ovules 4, pendulous from the apex of the ovary ; flowers bisexual or unisexual, in axillary clusters ; petals and stamens 4 ; leaves opposite or alternate..... [45. Haloragaceae](#)
- 11** Ovary with 2 or more ovules in each loculus : **12**
- Ovary with 1 ovule in each loculus : **17**
- 12** Leaves with free or interpetiolar stipules : **13**
- Leaves without stipules : **14**
- 13** Leaves alternate, sometimes all radical, often unequal-sided ; flowers unisexual ; stamens numerous, more than twice as many as the petals ; ovules numerous in each loculus ; herbs or shrubs, sometimes climbing or epiphytic, not viviparous [60. Begoniaceae](#)
- Leaves opposite ; flowers bisexual ; stamens twice as many as the petals ; ovules 2 in each loculus ; viviparous littoral trees or shrubs [70. Rhizophoraceae](#)
- 14** Anthers opening by a terminal pore ; connective often appendaged below the anther ; leaves with 3 or more longitudinal parallel nerves, opposite, sometimes all radical ; herbs or shrubs, sometimes climbing or epiphytic [68. Melastomataceae](#)
- Anthers opening by longitudinal slits ; connective unappendaged ; leaves without parallel longitudinal nerves : **15**
- 15** Stamens as many or twice as many as the petals ; herbs or shrubs, sometimes aquatic [43. Onagraceae](#)
- Stamens numerous, more than twice as many as the petals : **16**
- 16** Leaves alternate ; fruit with 4 longitudinal membranous wings ; trees [67. Lecythidaceae](#)
- Leaves opposite ; fruit a berry, unwinged ; trees or shrubs or sometimes herbs [66. Myrtaceae](#)
- 17** Stamens twice as many as the petals : **18**
- Stamens as many as the petals : **19**
- 18** Annual herbs ; leaves toothed or pinnately lobed ; flowers solitary, axillary ; fruit a prickly capsule [87. Rosaceae](#)
- Trees or shrubs ; leaves entire ; flowers in solitary or aggregated spikes ; fruit a drupe, not prickly [70. Rhizophoraceae](#)
- 19** Stamens opposite to the petals : **20**
- Stamens alternating with the petals : **21**
- 20** Ovules erect from the base of the loculi ; leaves with stipules ; fruit unwinged or with 1–3 wings, sometimes separating into 3 cocci ; trees or shrubs, sometimes climbing with or without tendrils [112. Rhamnaceae](#)
- Ovules pendulous from the apex or near the apex of the loculi ; leaves without stipules ; fruit drupaceous, not winged ; trees [104. Olacaceae](#)
- 21** Flowers solitary in the axils of the leaves ; floating aquatic herbs ; leaves alternate, rosulate, with a more or less inflated petiole ; fruit large, indehiscent, with hard endocarp and armed with 2 horns [44. Trapaceae](#)
- Flowers grouped in inflorescences ; plants not floating on water : **22**
- 22** Fruit separating into 2 cocci ; herbs or sometimes shrubs or trees ; flowers in simple or compound umbels, sometimes capitate or spicate ; leaves often much divided or compound [125. Umbelliferae](#)
- Fruit drupaceous, not separating into cocci ; trees or shrubs, sometimes climbing : **23**
- 23** Leaves pinnate or digitate ; flowers in umbels or racemes or spikes or heads, sometimes paniculate [124. Araliaceae](#)
- Leaves simple, often unequal-sided ; flowers in axillary cymes [123. Alangiaceae](#)

Group 14

- 1** Parasitic shrubs growing on branches of other shrubs or trees ; ovule scarcely distinguishable from the surrounding tissue of the ovary ; calyx truncate or lobed ; stamens as many as and inserted on the corolla-lobes ; leaves simple, entire [109. Loranthaceae](#)
- Plants not parasitic ; ovule or ovules clearly distinguishable within the ovary : **2**
- 2** Ovary 1-locular : **3**
- Ovary 2- or more-locular : **7**
- 3** Ovule 1 ; flowers actinomorphic or zygomorphic, in involucre heads ; fruit indehiscent, often crowned by the persistent calyx forming a pappus of bristles or scales : **4**
- Ovules numerous or several on 1 or more free-basal placentas ; flowers actinomorphic, not in involucre heads : **5**
- 4** Anthers united into a tube surrounding the style ; ovule erect from the base of the ovary ; herbs or shrubs or trees, sometimes climbing ; corolla of the outer (ray) flowers often differing from that of the inner (disk) flowers [139. Compositae](#)

KEY TO THE FAMILIES OF DICOTYLEDONS

- Anthers free ; ovule pendulous from the apex of the ovary ; herbs with opposite leaves [138. *Dipsacaceae*](#)
- 5** Calyx composed of 2 often deciduous sepals ; stamens more numerous than the corolla-lobes ; fruit a circumscissile capsule ; herbs.....[32. *Portulacaceae*](#)
- Calyx 4-5-lobed ; stamens as many as and opposite to the corolla-lobes ; fruit not circumscissile :**6**
- 6** Herbs ; flowers bisexual, in terminal racemes ; fruit a 5-valved capsule.....[142. *Primulaceae*](#)
- Trees or shrubs, sometimes climbing ; flowers unisexual or polygamous, in axillary racemes or panicles ; fruit a berry [130. *Myrsinaceae*](#)
- 7** Climbing herbs with tendrils ; flowers unisexual ; stamens 3, with flexuous anthers[59. *Cucurbitaceae*](#)
- Plants without tendrils ; flowers bisexual or unisexual ; anthers not flexuous :**8**
- 8** Corolla forming a deciduous cap (calyptra) ; stamens very numerous ; trees or shrubs with gland-dotted leaves[66. *Myrtaceae*](#)
- Corolla not forming a deciduous cap :**9**
- 9** Leaves opposite or verticillate, with interpetiolar or intrapetiolar stipules, the stipules sometimes leaf-like ; trees or shrubs or herbs, sometimes climbing [137. *Rubiaceae*](#)
- Leaves alternate or sometimes opposite, without stipules : **10**
- 10** Flowers with a 2-seriate lacinate corona outside the stamens ; corolla many-ribbed, the ribs ending in short teeth ; trees or shrubs, sometimes climbing[67. *Lecythidaceae*](#)
- Flowers without a corona ; corolla 5-lobed : **11**
- 11** Corolla zygomorphic, split down the upper (adaxial) side : **12**
- Corolla actinomorphic, not split down one side ; herbs : **13**
- 12** Anthers united into a tube surrounding the style ; ovules numerous in each loculus; fruit a capsule ; herbs[147. *Lobeliaceae*](#)
- Anthers free ; ovule 1 in each loculus ; fruit a drupe ; littoral shrubs or herbs[148. *Goodeniaceae*](#)
- 13** Corolla-lobes imbricate ; fruit a circumscissile capsule ; flowers in terminal spikes [145. *Sphenocleaceae*](#)
- Corolla-lobes valvate ; fruit a capsule dehiscent by apical valves ; flowers in cymes or panicles[146. *Campanulaceae*](#)

Group 15

- 1** Ovary 2- or more-locular with numerous clearly distinguishable ovules in each loculus ; plants with well-developed, leaves :**2**
- Ovary 1-locular, the ovule or ovules sometimes scarcely distinguishable from the surrounding tissue ; plants with or without well-developed leaves :**3**
- 2** Flowers unisexual ; perianth composed of 2 or more free petaloid segments ; stamens numerous, the anthers free ; leaves with stipules, often unequal-sided ; herbs or shrubs, sometimes climbing or epiphytic [60. *Begoniaceae*](#)
- Flowers bisexual ; perianth with an elongated tube inflated below, the mouth 2-6-lobed or produced unilaterally into a single lobe; stamens 6-24, the anthers adnate to the style ; leaves without stipules ; herbs or shrubs, often climbing [13. *Aristolochiaceae*](#)
- 3** Leaves reduced to scales ; plants parasitic on roots :**4**
- Leaves well developed, not scale-like :**5**
- 4** Flowers unisexual, in involucre heads ; ovule 1, scarcely distinguishable from the surrounding tissue of the ovary ; fleshy herbs with unbranched flowering stems densely covered with scale-leaves [111. *Balanophoraceae*](#)
- Flowers bisexual, solitary or clustered or in short spikes ; ovules 2-4, pendulous from the apex of a slender free-basal placenta ; herbs or shrublets with slender branches.....[110. *Santalaceae*](#)
- 5** Parasitic shrubs growing on branches of other shrubs or trees ; ovule or ovules scarcely distinguishable from the surrounding tissue of the ovary ; flowers unisexual ; anthers as many as and sessile on the perianth-segments ; leaves opposite [109. *Loranthaceae*](#)
- Plants terrestrial, not parasitic ; ovule or ovules clearly distinguishable within the ovary :**6**
- 6** Ovule 1 :**7**
- Ovules 2 or more :**9**
- 7** Flowers unisexual, densely capitate or arranged on or in a flat or cupular receptacle, the females sometimes solitary in the receptacle ; anthers opening by longitudinal slits ; leaves with stipules ; trees or shrubs or herbs[96. *Moraceae*](#)
- Flowers bisexual or unisexual, in cymes or panicles ; anthers opening by up-curving valves ; leaves without stipules :**8**

KEY TO THE FAMILIES OF DICOTYLEDONS

- 8 Stamens 9 ; anthers 4-valved ; perianth-segments 6 ; trees[6. Lauraceae](#)
 Stamens 3–7 ; anthers 2-valved ; perianth-segments 4–10 ; trees or climbing shrubs[7. Hemandiacae](#)
- 9 Stamens 6–10, more numerous than the perianth-segments or -lobes ; flowers in racemes or spikes or heads ; fruit indehiscent, often with 2–5 longitudinal wings ; trees or shrubs[69. Combretaceae](#)
 Stamens 4–5, as many as the perianth-segments or -lobes : **10**
- 10 Styles 4 ; stamens 4 ; ovules 4, pendulous from the apex of the ovary ; herbs or shrublets with flowers in axillary clusters[45. Haloragaceae](#)
 Style 1 with an entire or lobed stigma ; stamens 5 : **11**
- 11 Stigma large, with radiating lobes ; stamens opposite to the perianth-segments ; ovules 3-4, pendulous from the apex of the ovary at the top of a slender free-central axis ; flowers with stellate hairs on the outside of the perianth and ovary, in racemes or spikes or panicles ; trees[108. Octoknemataceae](#)
 Stigma small, entire ; stamens alternating with the perianth-lobes ; ovules 2, pendulous from the apex of the ovary ; flowers without stellate hairs, in dense heads; maritime shrubs[69. Combretaceae](#)
